■ Deputy Foreign Ministers of the Contadora Group (Colombia, Mexico, Panama and Venezuela) met with representatives of the five Central American countries (Costa Rica, El Salvador, Guatemala, Honduras and Nicaragua) for what was hoped would be the final round of negotiations on the draft Central American peace treaty. This draft had been presented by the Contadora Group to the Central American countries at a Foreign Ministers' meeting on 12–13 September 1985. There it had been decided that a permanent forty-five-day session would be held, interspersed with periods for direct consultation between Central American governments and their representatives, to secure agreement on the remaining contentious clauses of the treaty. The Contadora Group had announced its intention to abandon its peace initiative if by the expiry of that session on 20 November 1985 agreement had not been secured.¹⁴²

The first two meetings during the forty-five-day period were both adjourned without agreement on three key issues: military manoeuvres; arms reductions and verification and follow-up procedures. It was reported that Nicaragua had supported a total and immediate ban on joint military exercises with a foreign power, which would have directly affected the US presence in the region, while El Salvador and Honduras were in favour of 'regulation' rather than 'prohibition' of military manoeuvres. Nicaragua was also reported to have been unwilling to submit to controls on its level of weapons and soldiers as El Salvador and Honduras were demanding, until it had received guarantees that the US would end its aid to the anti-Sandinista ('contra') guerrillas and its threats against Nicaragua.¹⁴³

North-South Monitor

▲ Contadora Group

Meeting of Deputy Foreign Ministers and Plenipotentiary Representatives
Panama City, 19–21 November 1985

■ Representatives of the nine countries met for their third session of negotiations towards the end of the forty-five-day period allotted by the Contadora Group for the completion of the draft Central American peace treaty. In a communiqué which summed up the entire session since the draft treaty was first presented in September 1985, the Contadora group stated that agreement had been reached on the issue of implementing and verifying follow-up procedures and on the draft's final provisions.¹⁴⁴ Differences remained, however, on the two outstanding issues of military manoeuvres and arms controls.

Prior to the meeting on 11 November 1985, Nicaragua's President Daniel Ortega had written a letter to the heads of state of the Contadora Group countries. To it was attached a document detailing Nicaragua's position on the current draft treaty.¹⁴⁵ The letter repeated Nicaragua's proposal for a total ban on international military exercises and its insistence on a level of defence commensurate with the threat it perceived of direct US military intervention. In the absence of the 'minimum basic conditions' for Nicaragua's security, the country could not, the letter said, assume commitments towards arms control. The letter criticised the recent US Congress decision to grant \$27m in aid to the anti-Sandinista guerrillas. It condemned the US stance of demanding the immediate dissolution of the Nicaraguan National Assembly as a precondition for the resumption of the bilateral 'Manzanillo talks' between the US and Nicaragua which the US had broken off in January 1985.¹⁴⁶ In effect, President Ortega refused to sign a peace treaty without an additional protocol committing the US to cease its aid to the 'contras' and its military pressure on the Nicaraguan government. This precondition was opposed by Honduras and El Salvador.

After the meeting and the expiry of the 20 November 1985 deadline, the Panamanian Foreign Minister, Jorge Adadía, reported that the deadline for agreement had been extended by the Contadora Group for a further thirty days. It was hoped that this period would allow for negotiations on the remaining two unresolved issues.¹⁴⁷

Following an informal meeting of the Contadora Group and the Lima (support) group at Montevideo on 17 December a further meeting between the Contadora Group and its support group was planned for 11–12 January 1986. It was to be followed by discussions between the Contadora Group and leaders of other Latin American states in Guatemala City on 14 January 1986.¹⁴⁸

● 'We must not believe that peace in Central America depends only on an agreement among the Central Americans if there is no agreement or political will on the part of the US . . . There must be a political understanding with the US to end its war against Nicaragua so that there can be peace in Central America.' Nicaragua's Deputy Foreign Minister, Victor Hugo Tinoco, to the meeting, *Summary of World Broadcasts*, ME/8117/D/1, 25 November 1985.

▲Cartagena Consensus

Fourth Ministerial Meeting of Signatory States

Montevideo, 16–17 December 1985

■Finance and Foreign Ministers from the eleven Latin American debtor countries of the 'Cartagena Group'¹⁴⁹ met to coordinate their reactions to the 'Baker Plan'. This initiative on Third World debt had been propounded by the US Treasury Secretary, James Baker, at the IMF and World Bank meetings in Seoul in October 1985.¹⁵⁰ The Cartagena ministers formulated their response to the plan in the Declaration of Montevideo on the Latin American Economic Situation¹⁵¹ which incorporated a nine-point emergency programme directed towards the renegotiation of the region's \$350bn. debts and towards promoting economic growth.

In his opening speech, the Uruguayan President, Julio Sanguinetti, commended the Baker Plan for its recognition of the political dimension of the current debt crisis but said that the initiative was inadequate as a solution to the problem. The consensus as expressed in the final communiqué was that the plan was a 'positive step' in that it recognised the principle of joint responsibility between debtors and creditors for the region's problems, but that the funds it provided were 'totally insufficient' to guarantee debt repayments or to stimulate growth in debtor countries over the next three years. Ministers therefore presented a counter-proposal which, though not rejecting Baker's initiative, suggested additional measures to prevent the net transfer of resources from Latin America to the industrialised countries.

The Declaration of Montevideo anticipated zero growth in Latin America in 1986 and an expected outflow of \$32bn in debt service repayments. No adjustment efforts on the part of the debtor countries to improve their efficiency and increase exports were said to be able to compensate for the extraordinary deterioration in the international system resulting from high interest rates, low commodity prices, competitive subsidised products and protectionism in industrialised countries.

The emergency programme, suggested as a temporary measure, was designed to provide the necessary resources to compensate for the losses caused by high interest rates and deteriorated terms of trade and to finance investments required for the region's development. Ministers advocated:

- a reduction in real interest rates 'to their historical levels' by the end of 1986, and lower bank profit margins;
- increased flows of funds into the region with debts being divided into separate current and future portions;
- the maintenance in real terms of commercial bank credits, entailing additional loans to compensate for inflation;
- a ceiling on the outflow of capital from countries in the region, linked either to growth rates or to export levels;
- increased resources for multilateral development agencies including the World Bank, with a 20 per cent increase in their flow of resources to the region over the next three years;
- the increased availability of compensatory financing from the IMF over the next three years.

A ministerial committee consisting of Latin America's five largest debtor countries (Argentina, Brazil, Colombia, Mexico and Venezuela) was established. It was to monitor the progress of the plan and lobby for acceptance of the emergency

North-South Monitor

proposals among other countries and the banks. Enrique Iglesias, Uruguay's Foreign Minister and Secretary of the Cartagena Group, said that the committee would represent the Cartagena countries at all levels using the Declaration of Montevideo as its point of reference in negotiations. The Declaration contained a warning that the debtor countries reserved the right to take 'alternative measures' in the absence of an adequate response to the Emergency Plan. These measures would be formulated by the committee should they prove necessary.¹⁵²

● 'It is no longer sufficient that we simply recognise the problem. We need to take greater and bolder steps. We need to understand that we are in an emergency situation and that the time has come to take emergency measures.' President Sanguinetti of Uruguay to the meeting. *Financial Times* (London) 17 December 1985.

'We are not threatening anyone . . . we are proposing a constructive dialogue'. Juan Sourrouille, Argentina's Economic Minister, *IHT* (Paris) 19 December 1985.

'For the first time we spelled out that we may be exposed to unmanageable external shocks that force us into actions that no one wants. If there is a dramatic drop in a raw material price—look at oil or tin today - or a sharp rise in interest rates, current adjustment conditions will become unviable'. Enrique Iglesias, Uruguay's Foreign Minister, *IHT* (Paris) 24–25 December 1985.

▲ Angola-Tanzania

Summit Meeting

Luanda, 3–5 October 1985

■ The Angolan President, José Eduardo dos Santos and the Tanzanian President, Julius Nyerere, issued a joint statement after their three-day meeting. They condemned the South African régime for its military aggression and political and economic sabotage against frontline states, and for the threat its actions posed to the security of Southern Africa. They categorically rejected the US and South African demand for Cuban troop withdrawal from Angola as a precondition for Namibian independence. Reaffirming their belief that UN Security Council Resolution 435 is the sole basis for an effective solution to the problem of Namibia, they urged Pretoria not to hinder the irreversible process of Namibian independence.¹⁵³

▲ Mozambique-South Africa Meeting

Maputo, 11 October 1985

■ South African and Mozambican representatives met at the request of the South African Foreign Minister, Roelof 'Pik' Botha, to continue their discussions on alleged South African violations of the bilateral Nkomati Accord of April 1984. Following a meeting between the two countries in September 1985, during which the Mozambican President, Samora Machel, had presented evidence of violations, 'Pik' Botha had admitted that his country had been guilty of what he termed 'technical' violations of the accord.¹⁵⁴

North-South Monitor

At the October meeting 'Pik' Botha was accompanied by his deputy, Ron Miller, while the Mozambican delegation was led by Jacinto Veloso, Mozambique's Minister in the Presidency for Economic Affairs, and included Sergio Vieira, the Security Minister. No details were given of the meeting, but the talks were understood to have covered security matters, as well as other bilateral issues and economic cooperation between the two countries.¹⁵⁵

On 17 October 1985, following the meeting, Ron Miller confirmed that the joint South African-Mozambican security committee had been suspended at the request of President Machel. A spokesman for the South African defence force was subsequently quoted as having said that owing to the unilateral suspension of the joint committee, the South African authorities would not be investigating renewed Mozambican allegations of violations of the Nkomati Accord.¹⁵⁶ In later remarks in December attributed to Ron Miller, it was suggested that the plethora of accusations of South Africa's non-compliance with the agreement was unsubstantiated, and that it was 'total nonsense' to say that South Africa had not respected Nkomati.¹⁵⁷

▲ Angola-Zambia

Summit Meeting

Lusaka, 15 November 1985

■ Talks between the Angolan President, José Eduardo dos Santos, and the Zambian President, Kenneth Kaunda, reportedly centred on the worsening security situation in Southern Africa. In a final joint communique, the leaders strongly condemned the repeal by US Congress of the Clark Amendment prohibiting US assistance to the 'armed gangs' of UNITA, the National Union for the Total Independence of Angola. They stated that any US financial and military aid to UNITA would be considered direct interference in the internal affairs of Angola, and would undermine efforts by the frontline states to secure peace in the region. The leaders also dismissed what they considered to be US attempts to portray South African aggression against Angola as a civil war, and advocated that the conflict be seen in the context of East-West antagonisms.

The communiqué dismissed apparent constitutional reforms in South Africa as cosmetic, appealing to Western countries to impose comprehensive and mandatory economic sanctions on the régime, forcing it to abandon apartheid and release political prisoners, including Nelson Mandela. The leaders also reiterated their support for the South West Africa People's Organisation (SWAPO) in Namibia, and their faith in UN Security Council Resolution 435 as a basis for Namibia's independence.¹⁵⁸

▲ Southern African Frontline States

Ministerial Meeting

Harare, 28-29 November 1985

■ Foreign ministers met from Southern Africa's six frontline states (Angola,

North-South Monitor

Botswana, Mozambique, Tanzania, Zimbabwe and Zambia). They strongly condemned a South African threat to invade Zimbabwe if it did not cease guerrilla attacks against South Africa. Following four mine explosions near the town of Messina on the South African border with Zimbabwe, in which six South Africans were wounded, the South African Foreign Minister, Roelof 'Pik' Botha had warned that South Africa might send troops into Zimbabwe, if it failed to curb attacks which he attributed to black nationalist guerrillas. Zimbabwe's official radio station, Voice of Zimbabwe, had declared, however, that Zimbabwe's government policy remained that of prohibiting guerrilla bases, belonging to South African liberation movements, on its territory.

The frontline ministers also condemned both South Africa and the US for assisting counter-revolutionaries in Angola, and destabilising Southern Africa.¹⁵⁹

- ⁶¹ President Reagan retracted a statement made during an interview with the Soviet press, and published by *Izvestia* on 4 November 1985, to the effect that SDI would not be deployed until nuclear weapons had been eliminated. When questioned later by Western journalists, he said that he had not intended to grant the Soviet Union a veto over SDI deployment by their refusing to eliminate nuclear weapons. For a transcript of the original interview, see *UMS*, 5 November 1985.
- ⁶² See *IHT*, 25 October 1985; *G*, 25 October 1985, *T*, 26 October 1985.
- ⁶³ Shevardnadze's speech is in *SN*, 6 November 1985, p 411. See also *IHT*, 25 October 1985; *G*, 25 October 1985.
- ⁶⁴ The text of the Gorbachev-Reagan joint statement is printed in *T*, 22 November 1985, *FT*, 22 November 1985; and excerpts in *G*, 22 November 1985.
- ⁶⁵ Those attending the summit were Margaret Thatcher, Prime Minister of Britain, Chancellor Helmut Kohl of West Germany; Prime Minister Bettino Craxi of Italy, Prime Minister Yasuhiro Nakasone of Japan; and Prime Minister Brian Mulroney of Canada. President Mitterrand of France refused to attend, and was reported to have been embarrassed to receive such a summons (leaked to the public prematurely, in Bonn) just as he was preparing to receive a state visit from Mikhail Gorbachev. See *FT*, 1, 2, 3 October 1985, *G*, 1, 3, 25, 28 October 1985; *IHT*, 1, 2, 25 October 1985; *G*, 1, 23 October 1985.

North-South Monitor

- ⁶⁶ A letter from the US Defence Secretary, Caspar Weinberger, leaked to the *New York Times* on 17 November 1985, advised President Reagan against accepting a restrictive interpretation of the ABM Treaty which could limit the development of space weapons, or making commitments on SALT II. Though decried as an attempt to sabotage the summit, the leak was played down by both sides. *IHT*, 18, 19 November 1985; *T*, 18 November 1985; *FT*, 18 November 1985; *G*, 18, 19 November 1985; *Obs*, 17 November 1985.
- ⁶⁷ The joint statement to the two leaders was from President Raúl Alfonsín of Argentina, President Miguel de la Madrid of Mexico, Prime Minister Olof Palme of Sweden, Prime Minister Rajiv Gandhi of India, President Julius Nyerere of Tanzania, and Prime Minister Andreas Papandreu of Greece. It was printed in *IHT*, 31 October 1985. Gorbachev's reply is in *SN*, 13 November 1985, p 419 and *SW*, 16 November 1985. See also *T*, 9 November 1985.
- ⁶⁸ *G*, 23 November 1985.
- ⁶⁹ President Reagan's offer to share SDI had been made previously in an interview with the BBC: *T*, 31 October 1985; *FT*, 31 October 1985; *G*, 31 October 1985. For the transcript of the interview, see *USIS* Official Texts, 31 October 1985.

- December 1985; *FT*, 13 December and 14 December 1985; *T*, 14 December 1985 and *XNA*, 14 December and 16 December 1985.
- ⁸⁷ The seven Warsaw Pact members are Bulgaria, Czechoslovakia, the German Democratic Republic, Hungary, Poland, Romania and the USSR.
- ⁸⁸ The offers were made at the Geneva arms control negotiations and during Gorbachev's state visit to France on 4 October 1985. See *TWQ* 8(2) April 1986, pp 699-700.
- ⁸⁹ *IHT*, 22 October, 23 October and 24 October 1985; *T*, 22 October; *G*, 22 October and 23 October 1985; *FT*, 22 October and 24 October 1985 and *XNA*, 23 October, 24 October and 25 October 1985.
- ⁹⁰ Soon after the Antarctica conference in Brussels, the UN General Assembly voted, by a large majority, in favour of international control over the continent's mineral resources, and of expanding the scope of a UN study of the region. It also demanded the removal of South Africa from the eighteen consultative members administering Antarctica under the Antarctic Treaty. *G*, 4 December 1985.
- ⁹¹ *FT*, 7 October 1985; *T*, 21 October 1985; *XNA*, 21 October 1985.
- ⁹² The Commonwealth Accord on Southern Africa is printed in *T*, 22 October 1985; *T*, 22 October 1985 and excerpts in *G*, 22 October 1985. A partial text of the CHOGM communiqué is in *T*, 24 October 1985. The Nassau Declaration on World Order is in *Commonwealth Currents*, December 1985.
- ⁹³ Britain was required by the EEC decision only to withdraw its military attachés from Pretoria. It was already implementing the other measures in the EEC package which it was the only EEC country to vote against.
- ⁹⁴ An article by Sir Geoffrey Howe, the British Foreign Secretary, outlining the reasons for the British government's opposition to sanctions, is in *ST*, 13 October 1985.
- ⁹⁵ Johnstone Makatini, Head of the ANC International Department, was reported to have offered an ANC truce to Pretoria if President Kaunda's five steps were put into effect. *G*, 25 October 1985 and *SWB*, ME/8090/B/3, 24 October 1985. This offer was subsequently denied by ANC headquarters in Lusaka. *SWB*, ME/8092/ii, 26 October 1985.
- ⁹⁶ The members of the group were eventually decided as: Malcolm Fraser, former Prime Minister of Australia; General Olusegun Obasanjo, former Head of State of Nigeria; Lord Barber of Wentbridge, former British Chancellor of the Exchequer, Dame Nita Barrow, a President of the World Council of Churches; John Malecela, former Minister in the Tanzanian government; Sardar Swaran Singh, former Minister in the Indian government, and Archbishop Edward W. Scott, Primate of the Canadian Anglican Church. Malcolm Fraser and General Obasanjo were to be Co-Chairmen of the group, which was due to meet in mid-December. *Commonwealth News Release* (London) 85/31, 25 November 1985. Margaret Thatcher was unsuccessful in her attempts to have the British Foreign Secretary, Sir Geoffrey Howe, included in the group, which the Commonwealth Secretary-General, Shridath Ramphal maintained should not be composed of present incumbents of government office. *G*, 28, 29, 31 October 1985; *FT*, 29 October 1985.

- ¹⁴⁶ On the US-Nicaraguan meeting on 29 October to discuss the resumption of the Manzanillo talks, see *XNA*, 31 October and 2 November 1985.
- ¹⁴⁷ On 11 December 1985 following an informal Contadora—Central American countries meeting in Cartagena, Colombia, on 6 December 1985 (which Nicaragua boycotted), the Colombian Foreign Minister, Augusto Ramirez Ocampo, said that the Contadora Group was suspending negotiations on the draft peace treaty until May 1986. He was reported to have said that this five-month delay was requested by Nicaragua which also appealed for a halt to US military activities in the region before the peace treaty was discussed. The Nicaraguan representative cited the imminent elections in Honduras, Costa Rica and Guatemala as a reason for suspending the talks as a change in government could alter a country's stance towards the treaty.

The Mandelas: fighting for freedom

Cosmas Desmond

Winnie Mandela, Mother of a Nation

Nancy Harrison

London: Victor Gollancz. 1985. 181pp. £8.95

Part of My Soul

Winnie Mandela (Edited by Anne Benjamin and adapted by Mary Benson)

London: Penguin. 1985. 164pp £2.95pb

At the outset I should perhaps admit to a bias: I had the privilege of being closely associated with Winnie Mandela for a number of years and have the greatest admiration and affection for her. I therefore find it very difficult to write about her with any degree of objectivity. But I think it is quite impossible for anybody to capture her personality or to encapsulate her political views and assess her political role on the basis of a few interviews. It is a pity that these attempts, well-intentioned and useful to a point that they are, were not pre-empted by Zindzi Mandela's planned history of the family to which Nelson Mandela refers in one of his letters to his wife. His advice was that 'even those most dear to her must appear not as angels but as real men of flesh and blood with virtues and weaknesses. . . . Zindzi's work would serve wider issues and its main aim would not be the commercial one or desire for publicity.' Only someone like Zindzi or one who is not only close to the family but who has also shared in their suffering and in the wider struggle could really follow that advice. It would be presumptuous for anybody else to speak of the 'weaknesses' of one who has spent a lifetime fighting for freedom.

I am also hesitant to offer any comment on the present internal South African situation, since it is constantly changing. Throughout all the changing circumstances in South Africa over the past twenty or so years, however, there has been one constant factor: the acknowledgement by the majority of the people of Nelson Mandela firstly as a, and more recently as *the*, leader. The longer he has been in prison the more he has grown in stature both nationally and internationally. He has become a folk hero and invested with almost messianic qualities. But his position is not the product of mythology: it is firmly rooted in history. Before his imprisonment he had already established himself as a leader and a master strategist. Throughout his imprisonment he has shown, through the occasional messages he has managed to smuggle and in his

rejection of the government's blandishments, that he has not lost his grasp of the political realities nor his commitment to the ideals so eloquently expressed at his trial. Winnie Mandela, rightly accorded a certain status as Mandela's wife, has also throughout this time been a symbol of resistance and of hope and has become more and more a leader in her own right; recently she has been the most telling spokesperson within the country.

There have been major changes in South Africa in recent years. I refer not to the scrapping of certain aspects of so-called 'petty apartheid' nor to the government's bungled attempt at 'reform' through the imposition of a new Constitution, but to the changes in the nature and extent of resistance. The events themselves bear witness to the truth of the claim being made by many South Africans that the present resistance is qualitatively different from anything that has happened before; though there is also, of course, continuity with a struggle that has been going on for 300 years. This resistance is being fuelled rather than quelled by the violence and brutality of the government's response and by the irrelevance of the 'concessions' which the government has been forced to make. People are sacrificing their lives not for the right to sit next to a white person on a park bench or even for the right to own their own house. They are dying for the right to have a major share in the running of their country and in the just distribution of its wealth. It is clear that they are determined not to be fobbed off with anything less. They realise, as Winnie Mandela says, 'Our suffering of today is absolutely nothing. We face a very, very grim future.'

As they struggle towards this future, it is not for outsiders to pass judgement on their strategy and tactics about which there are bound to be internal disputes. We can only support all attempts to overthrow the common enemy. At the very least, we can stop supporting that enemy, which is what all the major Western powers are doing in our name. Despite the hundreds of deaths and the thousands of arrests that have taken place since the declaration of a state of emergency, despite the evidence of the systematic ill-treatment and torture of those detained, despite South Africa's continued illegal extension of the apartheid system to Namibia, despite the calls of virtually all black leaders for sanctions, the UK and the US, in November 1985, once again vetoed the Security Council's proposal for mandatory sanctions, while socialist France abstained. Paying homage to Nelson and Winnie Mandela does not compensate for our complicity, even if only by default, in their persecution and in the oppression of all black South Africans.

Every struggle needs its heroes, heroines and martyrs and it is important that they be recognised. Nelson Mandela, as the citation for the award of the 1985 Third World Prize to him and Winnie Mandela says, 'is honoured wherever freedom and democracy are valued. Streets and buildings around the world have been named after him; so has a nuclear particle. Many cities have given him their freedom; numerous universities have conferred degrees on him.'

Since last month his statue adorns the South Bank in London'. But a civic authority, for example, does not absolve itself of its complicity with apartheid by erecting a statue in honour of Nelson Mandela while it continues to invest millions of pounds in South African-linked companies. Such an action, far from being an honour, is actually an insult to Nelson Mandela, since it separates him from the struggle which, as he said, 'is my life'. I am sure that he would prefer that they showed their solidarity by disinvesting from South Africa rather than simply basking in his reflected glory. We cannot live vicariously through the achievements of Winnie and Nelson Mandela nor can we allow our admiration for them to divert attention from our own society's unsavoury role in creating the conditions which necessitate such heroic resistance. Apartheid has only survived this long because of the support it has received from the West, even, perhaps especially, from those countries which are presently calling for 'reform'. Even their calls for Mandela's release have a hollow ring. You cannot really want the release of Mandela if you are also thwarting the process of change in South Africa which would lead not only to his release but to his election as Prime Minister.

Winnie Mandela writes that, 'At present it's irrelevant who helps the black man to get rid of the shackles of oppression.' But she is well aware that not all those who claim to be 'helping' are in fact doing so. She certainly has no illusions about the futility of dialogue within the present political structures or about the role of multinationals; hers is yet another voice calling for sanctions. Although it is a serious offence for a South African to advocate sanctions, she states quite categorically that multinational companies, which she describes as 'political criminals', must get out, because 'foreign companies have literally financed our oppression'.

Big business and their political allies, both within and outside South Africa, are making a concerted effort to promote reform as an alternative to radical change. They are concerned more about their own future than that of black South Africans. They are hoping for the best of both worlds: to salve their consciences and defuse criticism by getting rid of the most obvious iniquities of the apartheid system, but to continue to appropriate to themselves an undue proportion of the wealth. An essential tactic in this strategy is to co-opt sufficient blacks into the system to act as a buffer against the majority. In this they differ from the Nationalist government only in the composition of the middle class. The government has for long attempted to form a black bureaucratic middle class through the 'homeland' structure, while big business seeks to use its private capital to create an urban middle class of white-collar workers. Neither Nelson nor Winnie Mandela shows any sign of being taken in by either tactic. Mandela has consistently refused to be absorbed into the 'homeland' system even though this would have secured his release from prison many years ago; Winnie Mandela dismisses 'homeland' leader Chief Buthelezi as a 'political prostitute'. There is no danger of them selling out for the sake of a

huge salary and an official limousine. Neither is there any possibility of their being used as pawns by big business. Both had repeatedly made it clear that their freedom is inseparable from the freedom of all black South Africans. It is in the interests of both big business and the government to create divisions among the people.

It is these white-created divisions which lead to violent confrontations between different groups of black people. Such confrontations are not inter-black conflicts as they are often racialistically described both by the South African and the international media. They are confrontations between revolutionaries or freedom fighters and collaborators or 'sell-outs'. The fact that both are black is as irrelevant as the fact that the miners and the 'scabs' who clashed during the miners' strike in Britain were both white. Those who describe them in racial terms are either succumbing to South African government propaganda or revealing their own racism.

Both Winnie and Nelson Mandela remain committed to the non-racial democratic ideals of the Freedom Charter. 'Whatever adjustments have to be made will be made within that sacred document. It will be a socialist state—there is no other way of sorting out our starvation problems, the discrepancy between the population groups, the haves and the have-nots. Everyone will have a fair share of the wealth of this country' (p 123). She also suggests that while dialogue can only take place 'on the release of all our leaders in prison, all the banned people and the return of all our exiled leaders', these leaders may not perhaps be prepared to negotiate on the terms they were prepared to offer twenty years ago. 'The leadership would have to be involved in an entirely new kind of political thinking; perhaps a completely new basis for dialogue and negotiation' (p 128). Land, as she notes, is still the key issue as it has been throughout the history of South Africa and indeed of the whole of Africa. 'Our fight is simply the fight for our fatherland, dating back to the frontier war started by the British settlers' (p 127). It was by forcibly taking the land that the whites were able first to impose their dominance and then to exploit both it and its people. No black leader has ever expressed any intention or desire to drive the whites into the sea: the Freedom Charter declares 'That South Africa belongs to all who live in it, black and white'. But any just redistribution of wealth must necessarily entail relieving the white population of most of the 86.7 per cent of the land that they have appropriated to themselves. In a free South Africa, land might well be even more important that it is at present. It is quite possible that many Western countries which presently claim that they cannot impose sanctions against South Africa because of their dependence on its gold and other minerals will decide that they can do without these commodities from a predominantly black-ruled South Africa. The fight against the multinationals, which have managed to keep so many African states in a position of economic dependence, will have to continue long after political freedom has been gained.

▲ General Agreement on Tariffs and Trade (GATT)

Textiles Committee Meeting

Geneva, 3 April 1986

■ Representatives of textile exporting countries searched for common ground on the terms of extending the Multi-Fibre Arrangement (MFA), which had been introduced in 1974 and was due to expire on 31 July 1986.⁶⁶

Low-cost producing countries had theoretically coordinated their positions at a meeting in Beijing in March 1986.⁶⁷ They had agreed in principle to drop their demands for an immediate end to the MFA, which regulates their textile exports, and for a return to GATT rules from which the MFA derogates. Partly, perhaps, because a return to free trade might provoke a strong protectionist response in the industrialised countries, thus denying low-cost producers even the limited but assured access afforded them under the MFA, the representatives at Beijing conceded that the MFA could be extended for a further four to five years. This concession was, however, conditional on assurances from the industrialised countries that the renewed agreement would be substantially liberalised, and that it would be the last. Moreover, many low-cost producers were suggesting that linking acceptance of the agreement with cooperation over a new GATT round of Multilateral Trade Talks (MTNs) could secure better terms for the textile trade. There was also a genuine sense that the industrialised countries' attitude to relaxing import controls on textiles, which involved the first major industrialisation project in the developing countries, was an acid test of their attitude to GATT. If they were unwilling to liberalise trade in textiles, it seemed unlikely that a further round of MTNs would yield many benefits for the developing countries. It at least seemed necessary that trade in textiles, which constitutes one-tenth of world trade in general, should be settled before the new round was due to begin in September 1986. It was therefore possible that protracted disagreements over the extension of the MFA could jeopardise the schedule of the entire GATT round.

The attitudes of the textile importers varied. The US, far from agreeing to increased liberalisation, was urging tighter controls over 'destabilising' imports and unexpected 'export surges'. Its representatives also advocated the extension of the pact to cover silk, ramie and linen, in addition to the existing provisions for cotton, wool and synthetics. They wanted these controls to be accompanied by reciprocal efforts on the part of textile suppliers to open their own markets to US products, particularly 'competitive' fibres. Meanwhile, the US was in the process of concluding bilateral agreements with low-cost suppliers, to freeze their exports at current levels.

While the EEC representatives agreed with the US that the rate of growth of their imports should remain low, they paid lip-service to liberalisation and suggested that the existing quotas should be redistributed to leave exports from 'dominant' suppliers (such as Hong Kong, South Korea, Taiwan and Macao) constant, while increasing the proportionate quotas of poorer suppliers (such as Bangladesh, Pakistan and Sri Lanka). Developing countries greeted this suggestion with a certain degree of scepticism. Hostile to attempts to divide them into dominant and poor

Predicting Numeiri's downfall: publish and be praised

The Sudan: A Second Challenge to Nationhood

Bona Malwal

New York: Thornton Books. 1985. np

During the last months of his regime writers of all kinds poured forth comment on the subject of Numeiri's Sudan and his possible downfall; they were like the vultures around the millions of dying animals in Sudan's drought-stricken regions. The three authors above, together with myself (Institute of Conflict Studies No. 173) all managed to publish relevant works before the downfall of Numeiri finally took place. It did not require great prescience to realise that the overthrow of one of Africa's longest survivors might finally be at hand, but for at least two writers there were other reasons than timeliness for wanting their views known before Numeiri fell. From 1971 until 1978 Mansour Khalid had been a prominent member of the various governments formed by Numeiri, including the post of Minister of Youth and Social Affairs, Ambassador to the UN, Foreign Minister, Minister of Education, and Presidential Adviser for Foreign Affairs and Coordination. Bona Malwal had been Minister of Culture and Information and a prominent member of the Politbureau of the ruling Sudan Socialist Union (SSU). Both had broken with Numeiri some years ago, and Bona had been detained for a year; nevertheless for men who are often considered, outside Sudan in particular, to have political futures as well as political pasts, some further denunciation could not come amiss.

In their different ways all three authors have the same message. Mansour and Gurdon express most clearly that there were in the 1970s seeds of hope, after which things turned very sour: while Bona concentrates on the latter phase, and especially the return to civil war in the South. Yet the manner of

presentation is markedly different. Gurdon's is a quite effective and concise descriptive study—essentially an extended piece of journalism and often written rather in the manner and depth of a special survey. Mansour's will probably be more widely read, partly because it has already been trailed with extracts in the Arabic press, but even more because it is full of stories about the Numeiri regime. There are many comments about Numeiri himself seeking to distract and fuel the Khartoum gossip-mongers and certainly this book too will keep them going for some time, though a number of the stories have already done the rounds, and Mansour is selective in leaving out many of those towards whom he is well favoured.

Yet when all is said and done it will be for the stories rather than the analysis that Mansour will be remembered, and indeed it can be questioned how far any of these works really go in examining the deep structural questions about Sudan, to which Numeiri sought different answers at different times, but all of which were at least as serious in 1985 as they had been when he came to power in 1969. Because the parliamentary periods and the rather static military regime of President Abboud had done little, many had hopes in 1969, or in the 1970s. Yet the manner of Numeiri's downfall, forced by mass demonstrations of hostility, was an expression of the determination with which the Sudanese wanted him to go, leaving all the major problems ultimately unresolved.

One of those major unresolved questions is the possibility of developing any kind of participatory democracy in that vast and heterogeneous country. Liberal democracy as practised from 1953 to 1958 and again from 1964 to 1969 was essentially about the manoeuvrings of parties and factions which commanded significant political followings. Not only the main sectarian-backed groups—sometimes divided against themselves as was the Umma Party from 1967–9—but the urban-based National Unionist Party (NUP), and coming up on the rails the Communist Party and the Muslim Brotherhood. Regional political forces were also growing in criticism and resentment, but unable to develop the backing and organisation to lay an effective claim to take part in the 'musical chairs' of parliamentary government, a situation which did much to contribute to the outbreak of civil war in the South. As for the successful politicians, some were driven by personal ambition, others by ideological commitment, while much of the competition for power was based on real or expected gains from participation in government. Socio-economically it reflected rather than developed the country and was thus increasingly seen as ideologically defensible but practically an unproductive form of government.

During his years in power, Numeiri represented many things, but none of them was that of being a liberal democrat. Mansour believes that it was precisely because he held no clear ideological position of his own that he was able to emerge as the leader of the Revolutionary Command Council established in 1969, but all were opposed to the liberal democracy they had overthrown and

Numeiri's personal leadership was never subsequently able to come to terms with the transience such a system necessarily implies.

So instead there were various forms of ideological guidance which Numeiri either encouraged or acquiesced in at different times (in Mansour's view always ultimately for pragmatic requirements of the moment); and a single political movement, the SSU. Yet these attempts too ran into Sudan's endless political sands, perhaps from the outset. For every ideological direction taken there was a counterweight ready to make itself felt and to use its influence even if no longer through a parliamentary medium. Thus the radicalism of the first two years, influenced in part by the Communists, was met by growing resentment in more overtly Islamic circles and in the South. The showdown with the left in July 1971 led to the 'technocratic' institution-building which so appealed to Mansour and others like him, but in turn earned the growing hostility of the old politicians. National Reconciliation in 1977 brought some of those leading figures, notably Sadiq al-Mahdi and Hasan al-Turabi, back into the fold but within the one-party framework which others still found unacceptable. The demise of that process by the early 1980s heralded Islamisation, which in turn helped alienate the South and end the achievement of peace a decade earlier.

While the ideological base of the presidential guidance went through various contortions, the main instrument of guidance, the SSU, typically found it hard to take root. It was not so much the core of the regime, as it was alleged to be, but an addendum, an offshoot of a military regime designed to give legitimacy and support, but in practice becoming a haven for careerists and opportunists and criticised even by the President himself.

If Sudan can neither accommodate liberal democracy, because of the inevitable inertia within the system, nor commit itself to ideologically acceptable popular guidance, is the alternative some form of autocracy? It is easy enough to point out that at its best Sudan has been governed as a flexible and adaptable autocracy—by Egypt until the Khedive Ismail's problems helped the rise of Mahdism, by the Khalifa Abdallahi, and by the British during the Anglo-Egyptian condominium. Even Numeiri's most stable years, from July 1976 to the end of the decade, were those when he was at his most flexible, and before the weakness in the economy was to become fully apparent. But the most current memory is of his recent oppressive autocracy—of what many Sudanese saw as the abuse of Islam, not only in the manner of imposing Islamic law but Numeiri's own claim to be Imam. In the circumstances of Numeiri's downfall Mansour puts as much faith in a return to parliamentary government as any other system while hoping that the parties will have learned their lesson, adding ominously 'although one has a lurking suspicion that they have not'. Officially this is the aim of the Transitional Military Council which overthrew Numeiri as well.

A second general question which arises, especially from Mansour's book, is the problem of institutionalisation in Sudan. At the time when Mansour and his

fellow 'technocrats' were most involved in government, much of the justification for their work lay in the shortcomings of the previous system and the need instead to build institutions, preferably with a degree of popular support. The limitations of the SSU have already been touched on but Mansour gives at least as much attention to the making of Sudan's first permanent constitution. It was not intended to give unbridled presidential powers but it did centre around an executive president, and Mansour and others frequently lauded President Numeiri with the justification that it was the office rather than the man that they sought to promote. Yet in the wake of the recent discussion of personal rule in Africa, with Numeiri hailed by Jackson and Rosberg as a prime example of a Machiavellian Prince (R Jackson and C Rosberg, *Personal Rule in Black Africa*, 1982), Numeiri must have felt that he scarcely needed enemies when he had respected friends like Mansour to shower praise upon him. Was it really so surprising then that when faced by a serious coup attempt in 1975 Numeiri should abrogate more powers under the constitution than its designers originally intended? Mansour, an author of the original constitution, deplors this tendency, and its subsequent decline into the manner in which Islamic law was introduced and Numeiri's claim to be Imam. But where were the institutions to check him?

The SSU clearly could be cut down if and when it threatened; and only belatedly did the National Assembly assert itself, when Southerners in particular rejected constitutional amendments concerned with *sharia* (Islamic law). If Numeiri's personal rule undermined the building of civilian institutions, it might at least have led to the growth of an effective security apparatus, and army, but even this did not happen. Civil security did grow and with it the political arrests. It was most unpopular, and after Numeiri, was the main casualty of his overthrow, with the Transitional Military Council being forced by the civilian revolutions to take action after initial hesitancy at turning on their former colleagues. Yet in comparative terms, when one thinks of domestic security in neighbouring Egypt, Uganda or Ethiopia, the yoke the Sudanese bore was very light. And while some sadists can be found in all societies there are reports that indicate that some security men shared the distaste of most civilians for some of what they were supposed to do. (One former political prisoner friend in many ways suffered less during his incarceration for two years in Korbar prison than a student I tutored in Reading Gaol.) Clearly the credit for this owes much more to the mores of Sudanese society than to the leniency of Numeiri, but it is an indication of the difficulties of institutionalisation, even of repression.

The army too finished weaker rather than stronger. The numerous attempted coups of the early years were contained, at least in terms of importance, partly by increased military security and partly by repeated purges of the officer corps. As Mansour expatiates, there was also a growing distraction in the form of money-making activities in the military corporations.

All this may have served to keep the army quiet, but it did not increase its military capacity, which the growing civil war in the South was to put to the test. Indeed when the army commander Siwar al-Dhahab did finally act in April 1985 it seemed almost to be with reluctance, and more out of fear of the consequences of allowing Numeiri to return from Cairo than a positive wish to see him overthrown. Small wonder many soon argued that Numeiri's regime lived on, though now bereft of the personal ruler himself and headed by men whose eschewing of political ambition hitherto had been central to their survival and promotion in the armed forces.

If institution-building held few successes then nor did economic development either, though here too there were high hopes and considerable efforts. Gurdon is particularly clear in describing the slide from optimism about transforming Sudan into the bread-basket of the Middle East, into a debt of \$9 billion less than a decade later. Once again Mansour provides the stories especially with regard to the influence of Adnan Khashoggi (AK) and his Triad company. The tales told here are both appalling and believable, but once again Mansour is selective. Apart from AK, the only other person reputed to have immediate access to Numeiri was Tiny Rowland, who does not even get a mention here. Were Lonrho's methods of operation so very different to the vicious corruption depicted here, not only in respect of AK? The AK-Rowland combination was indeed working until the end, as they sought at the end of 1984 to bring peace with the Sudan Popular Liberation Movement which might even then have saved Numeiri. But not even Rowland's influence with President Arap Moi of Kenya (where SPLM leader John Garang has an office) was enough to make this unlikely initiative come to fruition. (Mansour himself was also to be involved in unsuccessful shuttle diplomacy, together with Khalil Osman, Rowland's former colleague in Lonrho.)

But again the more basic issue of Sudan's economy is never directly addressed. It was in essence a typical neo-colonial economy centred on cotton, around which Sudan's long-standing penchant for mercantilist trade also prospered. Internally it was essentially regional, favouring the central and eastern areas of the country, increasingly at the expense of the south and the west. The big schemes planned for the 1970s were largely concerned to expand or re-direct that external dependence, especially with regard to agricultural markets in the Middle East. Some schemes succeeded, but at a very high price, as with the Kenana sugar plantation inspired initially by Rowland; others only partially worked, as with the textile factories; and others never worked at all, including, sadly, the brewery at Wau. (Development inevitably involves value judgements and I personally will acknowledge that the Sudan is developing when beer from Wau is being sold *throughout* the country.) But the big schemes of the central Sudan, of which Mansour was particularly in favour, not only helped the debt to grow, but also drew able-bodied labour, especially from the west. The present famine and suffering in that area in particular is the result

not only of population growth, over-grazing, desertification, poor rainfall etc. but also of political neglect, and the domestic economic peripheralisation and exploitation to which it has been increasingly subjected. Small wonder a sense of regionalism has been growing there, as well as in the South.

In all, Sudan's economy under Numeiri had failed either to achieve sustained growth, or to rid itself of its 'dependent' character. The former failures reflected not only the corruption, but the manifold inadequacy of the state to plan and manage large-scale development, or to promote small-scale activities. As for dependence, when the will to escape may have been present, from 1969 to 1971, there was not the capacity to achieve it adequately, with only an ineffective nationalisation policy to show for it. Dependence on the West and the conservative Arab states provided the necessity for 'pragmatism' to help a weak regime to survive; and the growing world recession also contributed to Sudan's failure to begin to realise its undoubted potential.

The South, and the breakdown of peace there, is the main concern of Bona Malwal, but disappointingly he tells us little new. Mansour too is less revealing on the region, especially the return to civil war, and it is left to Gurdon to chart the decline into conflict once more. But all essentially regard it as an area in which peace had been restored following an unfortunate civil war, rather than, as history might suggest, a region in which war has been re-started following a desirable but nonetheless unusual period of peace. Not that one should think that war in the South, or between 'the North' and 'the South' is inevitable, rather the development of the state itself contributed much to a situation in which, since it was first carved out in approximately its present frontiers in the 1820s by the Turco-Egyptians, there has only been sustained peace for two periods of any length—from the late 1920s, when the British had finally cowered the Nilotics by force until the late 1950s, and from 1972 to 1982. Clearly this colonial background suggests factors other than simply 'Arab' and 'African' or 'Muslim' and 'non-Muslim' in the development of conflict including in part the state itself.

The Turco-Egyptian state regarded the South as an area for crude exploitation. The whole initial invasion had largely been to obtain men for the army, so far as Mehemet Ali was concerned, and it became apparent that the further south one went, the easier this was to achieve. The initial exploitation of the South had been largely for other exports, most notably ivory for which there was a growing international market, but the state itself finished up by rewarding its agents less with salaries than with the human merchandise which in one way or another they could acquire. It was less the content of the nineteenth-century confrontation, i.e. Muslim and non-Muslim, than the exploitative manner of it which became a part of the mythology of the South. The Mahdist state often had problems of a core-periphery character, and conflict in the South remained the rule rather than the exception. British rule was less concerned with exploitation than pacification but considerable

violence was required to bring that about and then the very lack of ready opportunities for exploitation by a colonial economy left the region largely on a care and maintenance basis. In contrast the northern Sudan did increase its colonial-style economy, essential amongst other things for the financing of the state itself, and its own strong indigenous trading instincts also found an opportunity to operate in the South as *jallaba*, small merchants. Only after World War II was there a belated and unsuccessful effort by the British to develop the South, and encourage its political expression.

Indeed the post-independence period has been largely concerned with correcting the deep structural imbalance, but predominantly by political accommodation, rather than socio-economic change. As Mansour points out it was political redress which was offered at Addis Ababa, but even there he suggests, it was largely to bolster President Numeiri's own political position, rather than to begin any deeper reconstruction. Indeed when, after a decade of further relative economic neglect of the region, that seemed possible with discovery of oil, Numeiri, according to Mansour, once more put the needs of his underdeveloped economy ahead of well-justified Southern claims and in doing so contributed to regional resentment and conflict; once more, in essence, over the demands of the state, as interpreted by its personal ruler, on the region. A new peace settlement will be more complex than that achieved at Addis Ababa, if only because it will have to go more fully into the economics of regionalism than that agreement has done.

The issue of regional government in the north, which Mansour saw largely as a further presidential device to give the semblance rather than substance of a deconcentration of power, will also raise very tricky constitutional questions.

The last throw of Numeiri's regime, and thus of much concern to writings predicting his imminent downfall, was the turn to Islam and the introduction of a harsh *sharia* code. Bona sees it as a further major slight to the Southerners who basically have to concern themselves with the principles of a secular state so long effectively, though not without challenge, the situation in Sudan. Mansour makes great play with what to him, and many others, was essentially a perversion of Islam, especially when Numeiri decided that he was to be Imam, and expected others to recognise his newly acquired spiritual as well as political leadership through giving *baya*. For Gurdon it showed signs of a surprising ineptitude, especially with regard to the South, though if one does see it as having been in essence an attempt at opportunism, especially to outflank the Muslim Brothers, then one must remember that whatever the significance of the regions, regimes are ultimately made and unmade in Khartoum which had therefore to have first priority.

But the issue of *sharia* also brought into the open, perhaps never to be easily resolved, the question of Islam in Sudan. The quiet political influence of the *sufi* sects has long been known, and, as Mansour illustrates, Numeiri encouraged a number of the smaller ones during his years. The Mahdists too

are a well-known factor of an inherently political character. In more recent years the Muslim Brothers and the Socialist Republicans have claimed to represent more 'modern' interpretations of Islam. Yet all also indicate the divisive quality in political life which Islam can generate, as well as the problems with the non-Muslim communities. There is nothing unique to Islam in this, though it is a particularly 'political' religion, nor is it a problem unique to Sudan, but it does indicate that Numeiri opened up a Pandora's Box; and that the future of such issues as the place of Islam in the constitution is not simply a matter of Muslim-non-Muslim relations.

Numeiri thus left Sudan in far worse shape than he took it over and he bequeathed his successors the biggest crisis the country has known in almost thirty years of independence: debt, economic decay, famine, civil war, and an absence of any adequate institutions with which to tackle the problems. For the moment the army is in charge, though so far it has given little ground for confidence, and while the intelligentsia and the unions largely back the Alliance which led Numeiri's overthrow and supports the civilian cabinet, the political parties prepare to compete for power through the ballot box in April 1986. Where does that leave the Bona Malwals and the Mansour Khalids, so often spoken of outside Sudan? Mansour may have inadvertently supplied their epitaph when he writes that 'People should never count on politicians who lack their own constituency. The only means for the political survival of such politicians must always be competing for the favour of the man at the top. When such a man is neither guided by history nor motivated by a higher purpose he will always end up surrounding himself with obsequious sycophants fawning on him.'

Rethinking crisis and social change: some recent studies of Latin America

Politics and Dependency in the Third World: The Case of Latin America

Ronaldo Munck

Zed Books. 1984. 374pp. np

With Latin America so much in the news, these books are just a sample of dozens on its current traumas of social conflict, the debt and redemocratisation. Unlike the traditionally generalising 'Whither Latin America?' genre, many of these deal with single countries. This shows a new sensitivity to variations within the region. With it there are new questions to answer. What underlies the diversity? What different prospects does it suggest? And what unities remain within it?

One is the impact of the Depression on economies so heavily concentrated on the export of primary products. Yet these studies show that even this has diverse and sometimes dynamic outcomes. In the 1930s and 1940s most smaller

Latin American countries stagnated economically, under harshly authoritarian rule: those better endowed with natural resources and potential internal markets industrialised significantly and redemocratised in the 1940s. From this contrast emerged a new common theme: as growth declined (because it excluded the bulk of the rural population) it fell to two of the smaller countries, Bolivia and Guatemala, to pioneer the agrarian reforms from which a regional model for change emerged in the 1950s–1960s. This was ‘inward-directed’ development. Devised by ECLA (United Nations Economic Commission for Latin America) and promoted by a ‘new generation’ of leaders, planners and entrepreneurs, this was expected to foster more equitable, even growth and stable democratic systems.

Guatemala first challenged this optimism. As *Garrison Guatemala* reminds us, its elected reformists were overthrown with US assistance as early as 1954, foreshadowing Latin America’s future. *Rebellion in the Veins* describes Bolivia’s more gradual reversal of hopes for growth with redistribution, culminating in the 1960s. In the wings was another ‘new generation’ with a very different development model. Its tenor is conveyed by these books’ illustrations. On the cover of *The Pinochet Decade* is the one dictator apparently immune to the current wave of democratisation: pictured twice, once braided and once pin-striped, he epitomises the integration of civil society and the military in Latin America since the 1960s. Above all in Central America: bull-necked in battle fatigues on the cover of *Garrison Guatemala* is General-cum-President Oscar Humberto Mejia. Some of the illustrations convey what these regimes have meant for others. In *Peru—Paths to Poverty* an Indian humps the same outsize burden as generations of his ancestors, as if human labour were still so cheap that the wheel had not yet been invented. In *Garrison Guatemala* a lone peasant stands in a cemetery among rough wooden crosses marking the graves of the victims of Central America’s conflicts. It is not surprising that these new studies, as well as being less generalised, are less optimistic and predictive than those which once dealt in ‘Latin America—reformism or revolution?’.

Ascher’s *Scheming for the Poor* assesses the relative success of three distinct political styles in bringing about redistribution in Argentina, Peru and Chile. These are ‘populism’, ‘gradual reform’ and ‘radicalism’. They are typified respectively by Peron in the 1940s–1950s; Chile’s Christian Democratic President Frei, with his ECLA-type programmes in the 1960s; and his socialist successor, Allende, together with Peru’s radical nationalist, General Velasco. Ascher’s sensible question is this: eschewing ideology and scrutinising the evidence, which style does most for tangible social progress in Latin America, and why? He contends that the ‘gradual reformists’, with their lower profiles, are potentially the most effective; but what he stresses even more is political strategy and tactics.

By this he means building class coalitions in pursuit of incremental change.

The early Peron was the 'Machiavellian master' of this art; he succeeded in shifting resources from the agro-export oligarchy to industrialists as well as urban workers, without wholly undermining the oligarchy or losing control to organised labour. The sharpest contrast, in Ascher's view, is with the 'radical' Allende, doomed by his inability to disguise his lack of pluralism: even Frei is seen as lacking the skills to prevent his reforms from being imputed to sectional rather than general interests. Nor are popular loyalties easily won, since the redistributive effects of agrarian and wage reforms in such social structures are ambivalent: in Peru and Chile the beneficiaries, as tenants and those with formal employment, were typically just above the average income, while the rich passed their losses to the poorest, through disinvestment and the black market. Yet Ascher remains quite optimistic. The new technification and centralisation of the modern Latin American state do, he insists, now afford scope for redistributive policies, if only progressives would pursue them pragmatically, without demagoguery.

The other authors considered here would reject this positivistic view of social change as managerial and endangered by mass mobilisation. For example, though Munck shares Ascher's comparative perspective, he takes dependency and 'class struggle' as the keys to social change in the region. As these books show, such radicalism has long been the intellectual fashion; but one must indeed ask, as Ascher does, if this approach, and the factors which it emphasises, address the questions of what can be done, and above all, how, for purposes of substantive change in Latin America today. It is not such questions, but Ascher's answers which are unconvincing. Most obviously, his 'masterful' policymaking (more 'mistressful' in Peron's case) has not in itself assured any lasting redistribution of wealth or income. Where this has occurred and moreover endured in the Third World, it is less where elites have 'schemed for the poor' than where it has been possible for the poor themselves to win and defend it.

Ascher's blind spot is his merely pragmatic, depoliticised, notion of change. For instance, Cuba supports his case that real change necessitates tactical skills, but strictly *within* a political process. At issue here are the very elements of Ascher's liberal political science: this lacks appropriate concepts for dynamic social processes, as distinct from policy implementation. He is right to argue that most radical accounts of Latin America have failed to engage with substantive issues, yet his own behaviourist teleology, with master-men leading to 'modernisation', is just not equipped to be substantive. Peronism, for instance, was not just Peron, nor even Evita, but a whole complex of economic, social and political forces; and these were neither inert nor local, but both past and present, internal and external. Ascher's liberalism comes hardly closer than the most abstract of Marxist concepts to the structures and flow of Latin American social histories, with their popular—not just 'mass'—politics, and their *interplay with the external*.

Slim as they are, the 'Special Briefs' produced by the Latin America Bureau are much more wide-ranging. These sensibly priced paperbacks are designed as background information which, in *Peru: Paths to Poverty* and *Chile: The Pinochet Decade*, updates two of the countries covered by Ascher. Each starts with a handy factual resumé, then sketches the historical background and deals with recent events more fully. Elsewhere in this series sustained polemics on US foreign policy over-accentuate the externals; but in these two volumes one gets a clear sense of the politics neglected by Ascher being shaped by particular internal as well as the common external factors.

For Peru the overburdened Indian is an appropriate cover image. Like Guatemala, but unlike Mexico or Bolivia, Peru never had the revolution which would have involved a largely Indian as much as peasant underclass. This indigenous factor was recognised in the 1920s by the then nascent Communist Party and also by its rival, APRA, the Revolutionary Popular Alliance. Yet both failed to undermine the rule of the landed and commercial oligarchy, for want of any effective bridge between their coastal urban bases and the oppressed Sierra Indians. The changes subsequently effected by limited industrialisation were within this two-dimensional mould, controlled by and catering for the few, and particularly the foreign. In the 1970s neither the wave of nationalisations by the military radical Velasco nor his agrarian reforms could incorporate the underclass, now increasingly urban, which this structure had so long marginalised and its politics never represented. Yet contrary to Ascher's argument, it was less Velasco's radicalism than the consequent US destabilisation of Peru's dependent economy which renewed its crisis. In thrall to IMF orthodoxies, Velasco's non-radical successors, first military and then civilian, re-exposed Peru to the full blast of international recession. At the time of writing by Michael Reid, Lima correspondent for *The Guardian* (London), there was formal employment for under a third of the would-be working population; and 40 per cent earned less than one-sixth of the falling per capita average income. Hence the space afforded by recent redemocratisation to even the Shining Path Maoist guerrillas (the *Sendero Luminoso*), whose sense of their target is no more precise or original than the familiar 'imperialism and Peruvian semi-feudalism'. The more tangible oppressors, at whom their Indian followers hurl Coke-can grenades, remain the 'mistis', of which 'honky' would be a fair translation—the Conquistadores and their modern descendants, including the APRA, now ruling a country so little changed by military rule or redemocratisation. The case for radically rethinking available prescriptions for change in the light of actual structures and histories could not be more vividly illustrated.

Chile's distinctness is almost the opposite of Peru's. However bitter its recent experience, it does have an underlying direction, which is well conveyed in the twin volume by O'Brien and Roddick. What Presidents Frei and Allende shared was not mismanagement, as Ascher would have it, but the opportunities

and constraints ensuing from Chile's distinctive structural history. In this heavily mining economy, with a well-defined proletariat and coherently left-wing political parties, the Depression produced a unique mass movement resulting in a Popular Front government and state-led industrialisation. This movement ebbed, but never waned. It was this which swept centrist Frei aside and socialist Allende to power, prompting concerted ruling class and massive US destabilisation. The account of Pinochet's decade by O'Brien and Roddick is more than a briefing. They demonstrate the internal roots of the anti-Popular Unity movement, as well as the US backing for it. They then unravel the fascism and monetarism behind the junta. In arguing that monetarism ruled, they achieve a convincing synthesis of the economic and political details of ten bloody years under Pinochet. Assigning the brutalities to an appendix on human rights, they concentrate on the growing resistance. It is this, with its historical depth, which underlies their optimism. Out of the ashes, they insist, a new working class is being born, to lead a popular movement with flexible socialist horizons. 'The message of Chile is not very different from that of Poland. People want to determine their own futures. . . . If they are strong enough, and determined enough, over a long period of time, then ultimately they will win.'

Dunkerley's study of Bolivia provides a similar example of where Marxist analysis still looks, in Latin America as elsewhere, for its models and motors of social change. This, in obvious contrast to Ascher, is to popular (understood as 'class') movements led by 'workers' (or increasingly specifically, by 'the working class' or 'proletariat'): this is the central radical convention which needs examining rigorously in the light of such particular, if similarly oppressive, histories.

In *Rebellion in the Veins* the Marxist canons command attention as the conclusion to a comprehensive and scholarly account of the generation of political history since the 1952 revolution. By then the once prosperous Bolivia had been well and truly underdeveloped: its only significant export was the tin controlled by three local families, while the Indian mass of the population was subjected by the landed oligarchy to what Dunkerley describes as a combination of apartheid and semi-feudalism. Hence the radicalism and the limitations of the 1952 revolution, when a popular insurrection gave power to the MNR, the National Revolutionary Movement; this had previously been elected but banned from power by the military. With a radical middle-class leadership and a popular following of miners and peasants, it replaced the army with popular militias; it nationalised tin, and in theory established 'joint government' with the trades union confederation; and based an agrarian reform on peasant's seizures of backward estates in the densely occupied Altiplano. But inexorably, contradictions emerged between this political precociousness and the country's economic frailty. Keeping afloat meant selling tin and, as prices fell, loans to balance the budget: as a result, the

economy was soon virtually planned by the IMF and US advisors. As wages and social conditions declined, the MNR's popularity waned and the strongly politicised miners led widespread protests. A new standing army replaced the militias, and a coup in 1964 ended the decade of democracy and began nearly twenty years of military rule. Based partly on peasant clientelism, and supported by neighbouring dictatorships in Argentina, Brazil and Chile, this was fuelled by oil and agribusiness, including the generals' cocaine production. As this socially regressive growth ended amidst recession and fresh protests, much of the political left was fragmented by imported blueprint divergences between Trotskyists, Maoists and the Communist Party; but in 1982 enough of it was reunited in the UDP, the Popular Democratic Union, to re-elect as President the more radical of the traditional MNR leaders, Hernan Siles. Writing soon afterwards, Dunkerley doubted if such a 'reformist' administration could avoid being crushed between the economic restraints and the popular pressures; its subsequent instability has borne out this prediction.

As to alternatives, his conclusion echoes O'Brien's and Roddick's, though in more explicitly Trotskyist terms. In 'a country condemned to continuous backwardness in a process of combined and uneven development', Bolivia's recent history has involved 'the highest degree of proletarian politicisation within a broad Leninist idiom. . . . The fear that the (UDP) government will only lead to a brutal reimposition of a military mandate clearly cannot be discounted. But what is certain is that a further alternative—a mass political movement for socialism—has acquired exceptionally strong roots and remains a vital possibility'.

Like the 'message of Chile' from O'Brien and Roddick ('ultimately they will win'), this conclusion is hard to question without risking one's socialist credentials. The fact is, though, that such optimism is much less demonstrably founded on the substance of these particular histories than on the observers' teleology and formulations of history in general. Despite pin-pointing the particularities of Bolivia's modern political history, Dunkerley seems little inclined to make critical enquiries of it. Its turning points are not examined to substantiate, or better still, to test the Trotskyist trajectory to which it is all reduced in conclusion. For instance, should the mining proletariat, never numbering over 50,000, be cast as such an exclusive subject of a popular history still consisting so overwhelmingly of peasants? Especially for Third World societies this opens a whole new set of questions not only about non-'proletarians', but about coordinates other than class and potential options for social change precluded by static Marxisms' narrow, and yet diffuse, horizons. If all depends on 'proletarian politicisation', what 'vital possibility' is there for what kind of 'political movement' for 'socialism' in what sense, in Bolivia's historical conditions? Persistent 'peasantness' in the Third World is central to these substantive issues of agents and trajectories of change

which Bolivia's story constantly raises: yet Dunkerley's end-vision overrides them, despite his careful and skilled narration.

This case for inductive analysis is strengthened by Guatemala's experience. Since the 1954 overthrow of its reforming government, the country has been closer than even its Central American neighbours to a state of virtual civil war, made all the more significant by its proximity to Mexico and its rich natural resources, both land and oil. Over thirty years these have made for particularly predatory and brutal authoritarian regimes. At first civilian then military, they have been equally habituated to terrorising the mainly Indian peasantry and seizing its land for speculation.

Garrison Guatemala's radicalism is sometimes more rancorous than thoughtful, and its assertions at times abrupt. For instance, the lack of a political centre is an impression often created by Central America's political violence, but not the constant which George Black makes it, even in Guatemala's case. This book's real strength as a study of change is in spotlighting the heart of the matter, in the development 'from below' of a deeply indigenous popular resistance, in the peasant highlands, the coastal plantations, and the growing urban slums and work force. This follows a first, introductory part on 'the monopoly of power'—the paramilitary white terror imposed publicly by the ruling class in the years after 1954; its use as a means of control and expansion in the agribusiness and oil booms; and the direct military assumption of power in the late 1970s to suppress the growing resistance movement. Part two charts this growth—its roots in the structures of exploitation and increasingly in the sheer repression wreaked on the civilian population; and its political coordination, rather than any blueprint direction. Both were comparable to but more complex than those of Sandinista Nicaragua. In the 1960s–1970s both electoral and guerrilla failures helped to dissolve fixed oppositions and formulae on the political left. There ensued in effect a division of revolutionary labour between groups emphasising and working in different regions and social sectors, urban and rural, Indian, peasant and proletarian—sectors which were themselves converging through the maelstrom of dispossession and change in the 'dependent development' model.

In Guatemala, unlike Bolivia, this process expanded especially harshly into the heavily populated, peasant and Indian Central Highlands. It is above all their ethnicity, so woven from centuries of oppression and resistance, which has motored this people's mobilisation—it was clearly as Indian communities that whole villages took the awesome step, for those with only peasant resources, of physically resisting a national army. This was channelled into a national popular rather than just ethnic framework by the seemingly autonomous politicisation (though the Church was also a major influence) of both the rural and urban unions. In the 1970s these were steadily reinforced from the centre and prepared for clandestinity by the generals' erasure of civi

rights in the name of their counter-insurgency programme. Increasingly rooted in this popular movement and united by their awareness of it, the insurrectionary left became the heir to this situation. The Vietnamese parallels are striking: as Black observes, the US is the prisoner as much as the master of the monster spawned by its 1954 intervention.

Politics and Dependency is complementary to these case studies, as an overview and application of theories of change in Latin America. The theories themselves are a well-trodden subject: Ronaldo Munck's two opening chapters on 'dependency and modes of production' and 'capitalism and imperialism' follow closely in other writers' footsteps.¹ His claim to originality here is 'dependent reproduction', a concept designed to bridge the external connotations of dependency and internal ones of modes of production: by it he means that Latin American economies are too reliant on external markets and on importing key means of production to sustain their own capital accumulation or develop fully capitalist relations. The unity of Latin America lies in the consequent contradictions; these vary between three types or stages of 'dependent reproduction' and class struggles within them. What distinguishes this from similarly abstract, economic and seemingly fatalistic schemes by others such as Amin and De Janvry,² can only be judged by its application. Part two on 'class' begins with another overview of class theories from Marx to Gramsci and Thompson, concluding that classes exist through 'struggle', are weak yet complex in Third World societies, and that other concepts like race and gender cannot be reduced to class. These, too, are standard generalisations. What follows, though, suggests how much harder they are to practise than to preach: a catalogue of the region's classes, from 'bourgeois fractions' to 'marginal' ones, is succeeded by separate chapters on women in Latin America, on urban labour in Brazil and Argentina, and on peasants in Chile as an instance of 'rural social movements'. Then in part three, on 'politics', there are separate chapters on post-1930 state and capital in Brazil, and on 'comprador', 'nationalist', 'military' and 'socialist' regimes, each illustrated by a country or region.

Whilst this is a solid compendium of existing literature and approaches, it does less to distinguish critically or develop or practically apply them in the stated terms of 'class analysis'. Munck's use of theory comes down mainly to the production of typologies, concluding in a triple one of 'state forms'—oligarchic, populist and military—which is scarcely novel nor quite clearly related to the earlier typologies, of regimes and 'dependent reproduction'. Nor

¹ Notably those of the following. Ian Roxborough, *Theories of Underdevelopment*, London: Macmillan, 1979; Anthony Brewer, *Marxist Theories of Imperialism*, London: Routledge and Kegan Paul, 1980; and Ronald Chilcote (ed), *Dependency and Marxism*, Boulder, Colorado: Westview Press, 1982.

² Alain de Janvry, *The Agrarian Question and Reformism in Latin America*, Baltimore: The Johns Hopkins Press, 1981; Samir Amin, *Accumulation on a World Scale*, New York: Monthly Review Press, 1974.

is it clear how specific class struggles relate to these types, the typing being in terms of external economic and elite relations, not internal class ones. There is a real problem of how to structure such a comparative study of change, but this could be resolved by thinking through and pursuing concepts clearly prioritised as central: 'classness' understood as relations, as process, as interwoven with ethnicity and so on, would not, for instance, mean separating the study of urban labour in Brazil from that of state and capital, nor beginning the latter in 1930—an essentially institutional date, which uproots the capital-labour relations of industrial accumulation from their formative roots in plantation and immigrant Brazil, and the reproduction of non-capitalist realisations from its texturing by local ethnic history.

True, any such analysis will raise more questions than it can answer, both general and particular—from the balance between the Thompsonian 'making' of classes and sheer capital's restructuring effects, to the trajectories and outcomes of change. On these, though, honest uncertainty again seems more substantive, and by no means less political than Munck's standard concluding Marxist choice between incomplete dependent bourgeois or united socialist revolutions. Once again, do such preordained yet vague horizons, however comforting, bring us truly closer to the world around us, and thus to the tasks of substantively changing it? Do we want 'theory' (by which its original Greek users meant 'observation') to be about classifying or explaining? Confirming answers, or making enquiries? The alternative conclusions to the radical conventions of the generalisers among these authors are that theories and concepts of social change are not intellectually revealed, but made by histories, increasingly those of popular struggles, and should therefore be deduced from them; and that many relevant to the Third World, and perhaps to the First, are still in the making.

Global Problems without solutions?

The Non-Aligned, the UN and the Superpowers

Richard L. Jackson

New York: Praeger, 1983. 315pp. np

US Foreign Policy and the Third World: Agenda 1985-86

Edited by John W Sewell, Richard E Feinberg, and Valeriana Kallab

New Brunswick and Oxford: Transaction Books, 1985. 238pp. np

*Is the conflict between North and South irresolvable? Yes, if one is to accept the analysis of Stephen Krasner in his thought-provoking book, *Structural Conflict*. Krasner argues that the current debate over a new international economic order is not primarily about economics but about power. 'Outlandish disparities in power' (p 13) make Third World states politically vulnerable and insecure; they seek to mitigate this vulnerability by proposing changes that the North will not (and according to Krasner should not) accept. As the developing states will continue to attack the existing regime, Krasner concludes, 'North-South conflict will be an enduring characteristic of the international system. There are some problems for which there are no solutions' (p 314).*

North-South relations is a problem without solution for Krasner because it involves basically irreconcilable interests. The Overseas Development Council (ODC), a policy analysis organisation in Washington DC does not share Krasner's bleak view. For over a decade, the ODC has been publishing a periodic volume on US-Third World relations. Indeed Krasner identifies John Sewell, president of the ODC and co-editor of the current *Agenda*, as one of the 'reformist liberals' (p 25) who has argued for a more forthcoming American policy toward the Third World on the mistaken assumption that economic growth in the South will eliminate the basic source of conflict. *Agenda 1985-86* continues to assume that the US can pursue policies that will help to solve the problems of development.

Krasner attributes what success the Third World has had in challenging the North to organisations like the Nonaligned Movement (NAM) that have exploited their access to international organisations to effect some changes in

the existing order. Yet the North could simply abandon the UN if it wished to deprive the South of this base of operations. Krasner observes sardonically that UN headquarters in New York are 'coming to resemble the Guantánamo Naval Base in Cuba. Both are an affront to the principles and norms of the territories that surround them and both are vestiges of past power configurations' (p 299).

Richard Jackson is a US diplomat who has served at Guantánamo on Turtle Bay. He is keenly aware of how the non-aligned have used their numerical majority to control the agenda in the UN. Yet he believes that it would be a grave error for the US to exercise what Krasner calls 'the option of exit' (p 301). His book amply reflects his discomfort with the influence of such states as Algeria and Cuba within the NAM, but his goal is to outline an American policy that would 'ease the present sterile confrontation' (p 259). Like the ODC, Jackson does not despair of the possibility of finding solutions to the problems of US-Third World relations.

Of these three books on North-South relations, Krasner's is the most theoretically self-conscious. Employing the framework of recent academic writing on regime theory,¹ his analysis is conceptually sophisticated and intellectually challenging. His argument that the Third World is responding to structural inequalities in the distribution of power is well taken; he is right that the NIEO is fundamentally an effort to compensate for structural weakness. The theoretical argument is impressive. Whether it leads to the policy prescriptions with which he concludes can be considered by examining his study in conjunction with the work of Jackson and the ODC authors. This trio of books by an academic, a policymaker, and a lobbying group provides an interesting range of American thinking on North-South relations.

Krasner's subtitle, 'The Third World against global liberalism', succinctly conveys his major theme. The North has established a global economic regime dominated by the liberal norm of market allocation. Market regimes allocate resources in accordance with endowments, ie they favour the strong. What the weak prefer are 'more authoritative as opposed to more market-oriented modes of allocation' (p 5), i.e. allocation by political authorities rather than private actors. Authoritative regimes provide greater control and security to hard-pressed developing countries than market regimes. Third World states thus seek to limit the market power of the North by extending state control to embrace a broader domain of economic activity (such as commodity prices, multinational corporations, or seabed mining) than under the prevailing liberal norms. It is because the Third World is against liberalism that its challenge can not be resolved by mere economic growth. The South wants to change the rules of allocation, the basic rules of the game, an enterprise that Krasner considers 'normatively suspect' (p 29).

¹ Krasner is the editor of *International Regimes*, Ithaca: Cornell University Press, 1983, most of which originally appeared in *International Organization* 32(2) Spring 1982.

Krasner sees evidence for his thesis in many domains. One is the Third World's reaction to the OPEC price increases of the 1970s. Had the primary concern of the non-OPEC developing states been material welfare, they would have sided with the North on economic grounds. They did not, because they saw the action as a successful instance of regime alteration in the direction of state control. Similarly in the UNCLOS negotiations over alternative oceans regimes, the Third World opted for the solution that maximised political control (extensive coastal rights) over one that Krasner argues might have yielded greater international revenues. Where the pre-existing regime already operated on authoritative allocation (as in civil aviation), the South posed no challenge, whereas it did seek to change the market-oriented ocean shipping regime.

Krasner's modified realist approach does explain Third World diplomatic behaviour better than economic approaches. To redistribute power and to enhance security have always been central goals in the state system. Yet, as Krasner acknowledges, regimes that redistribute power can concurrently redistribute wealth. Moreover one can accept Krasner's analytic argument about the 'fundamentally political character' (p 27) of Third World demands without endorsing his claim that they are normatively suspect.

Krasner does not really elaborate on this point. Presumably he prefers market regimes on ideological grounds, and simply leaves the matter at that. What he actually does proceed to argue at this point is that 'developing states do not have the power to create completely new international regimes' (p 29). This may make the Third World quest for authoritative regimes realistically 'suspect', but it does not establish a normative argument. Krasner admits that even under the liberal regime 'when national security was at stake, authoritative allocation always took precedence over the private market' (p 67). In light of his own emphasis on the Third World's pursuit of security, one wonders whether this might not legitimise the Third World's normative preference. What is at issue more fundamentally here is whether an international market regime can ever resolve the global problem of development. Historically, economic liberalism has meant unequal exchange and has produced the very gap that the South now contests. Although Krasner understands perfectly why the South is trying to change the regime, his own conclusion is that change would not contribute to a 'stable international environment' (p 30). In the name of stability, he calls not for a development regime but for delinking.

A good way to reduce the irresolvable conflict, in other words, is for the South to break with the North. In this manner, Krasner's argument merges with the prescription of some dependency theorists. Krasner's twist is to argue that the North has an interest in encouraging collective self-reliance in the South—ironically, Krasner's preference for the market leads him into the company of Julius Nyerere. The difference is that Nyerere has always seen

collective self-reliance as a stimulus to regime change whereas for Krasner it is an alternative.

Richard Jackson has served in the trenches of the North-South conflict at the UN. It is evident that he was often exasperated by nonaligned votes and declarations. He takes to task leaders like Nyerere and Houari Boumedienne for their structuralist critiques of the North (he is especially tough on the Algerian leader whose name is mis-spelled, p 24, and whose place and date of death are mis-stated, p 65). Yet his larger purpose is to present the movement as a force with which US diplomacy must deal intelligently on the grounds that a strong, independent Third World grouping is compatible with American interests.

Much of the material on the origins and evolution of nonalignment will be familiar to specialists. His chapter on the 1983 New Delhi summit is an informative account of what the proceedings looked like to a State Department observer. His material on the activity of the non-aligned subgroup on the Security Council is fresh, and his data on voting correlations generally confirm intuitive impressions. Overall, the book is a valuable introduction for non-specialists.

Underlying Jackson's study is a policy argument against abandoning the UN in anger or frustration (one of Krasner's predictions as to how conflict might be reduced). He is dubious moreover about the impact of such initiatives as Ambassador Jeane Kirkpatrick's October 1981 letter or Senator Moynihan's Foreign Aid Bill amendment designed to pressure non-aligned governments to disavow movement declarations. He much prefers quiet diplomacy and steps to accomodate the NAM on key political matters like Resolution 435 on Namibia and the Palestinian question. Krasner would likely counter that such steps would not eliminate the basic vulnerability of the South, which would continue to bombard the North with proposals for regime change. But Jackson's assumption is that some of the problems that the non-aligned have raised are resolvable; he calls for a new approach to test the proposition.

Such is likewise the thrust of the ODC *Agenda 1985-86*. Krasner's citation of editor Sewell refers to the 1977 volume, but he would presumably see the same reformist orientation in the newest volume which continues to rest upon the assumption that the United States should do more to meet Third World developmental needs. Like previous numbers in this series, *Agenda 1985-86* offers informed essays on specific policy questions: in this instance, macro-economic policy, international finance and debt, trade, and aid. Each essay focuses on the record of the Reagan Administration during its first term. A final contribution compares the records of the Carter and Reagan administrations in dealing with radical regimes.

The volume presents a clear rationale for the policy reforms that Sewell and his associates currently favour: a macro-economic economic policy that reduces the fiscal deficit and interest rates, thereby stimulating Third World

growth; frank recognition that private financial markets are inadequate to handle the current global debt situation; a trade policy that does not seek to impose equal standards on manifestly unequal countries; a reversal of the Reagan administration trend toward military aid over aid to the poor. Richard Feinberg's chapter on international finance engages the issues of market versus authoritative allocation that are central to Krasner. He emphasises how the private sector 'increasingly sought the clasp of the visible hand of government' including international financial institutions in order to manage the debt problem (p 59). Krasner observes that the basic Keynesian principles of the international financial institutions coincide with the Third World preference for authoritative allocation. Krasner's point is that here was one norm over which North and South did not have to fight (even if the South did contest other aspects of the regime like conditionality and weighted voting). Feinberg's point is to stress that authoritative allocation is prudent and desirable in this instance, because private markets are not suited to all problems.

What should Northern policy be in the face of the Third World's pressure to establish new regimes? Clearly these books will stir rather than settle that debate. Krasner's analysis does demonstrate convincingly that the concepts of regime theory are helpful in understanding North-South relations. His suspicion of the principle of authoritative allocation (or perhaps his assumption that the North will not accept it) leads him to the conclusion of enduring conflict. Neither Jackson nor the ODC formulate their policy recommendations in terms of an opposition between contending regime principles. Implicitly, however, the ODC favours steps toward coordinated management of the global economy for the sake of Third World development. Norms, principles, and policies that enhance development—indeed it might be well to refer to such as a 'development regime'—offer paths toward a solution that have not yet been explored.

The World Crisis in Education: The View from the Eighties

Philip H Coombs

New York: Oxford University Press, 1985, 353pp. £8.95pb

In the 1950s and 1960s education's role in the development process was widely acknowledged—by politicians, by economists and not least by educationists. Investment in formal education systems and the expansion of literacy programmes would lead to the development of attitudes of mind conducive to 'modernisation', 'change', 'innovation' and 'logical thought processes'. There was a sense of optimism, even of euphoria, to such an extent that some writers have described the early 1960s, the period when ambitious education plans were drawn up and educational planning units were established in many countries of the Third World, as the 'age of innocence'. Thirty years later, in the mid-1980s,

there is no longer the same certainty about education's role in socio-economic development. Too many of the expectations of the 1960s have not been realised. Politicians in both the North and the South have begun to look critically at education and have begun to cut education budgets substantially in real terms. For the 50 per cent or more of children who are not enrolled in school, particularly in the African continent, future prospects are far from encouraging, especially as costs for formal education continue to increase dramatically.

This gloomy scenario had already been predicted in 1968 when Philip Coombs first published his *World Educational Crisis*. His *World Crisis in Education: The View from the Eighties* (1985), an excellent survey, containing many useful charts and statistical data, which should be read by politicians and planners in the North as well as the South, reviews what has occurred in the intervening years and concludes that there is still a continuing world crisis in education. Coombs examines the political, economic and demographic changes that have taken place, the changed perceptions about education with greater emphasis on non-formal provision (NFE) and points out that we are increasingly talking about 'a learning network' rather than systems analysis. While one would have liked a greater depth of analysis this is a wide-ranging, perceptive and thought-provoking volume. Coombs argues that the aim of his book 'is not to be a bible with all the answers but to provoke and contribute to a broad discussion of critical and complex educational issues' (p 31). In that he certainly succeeds, and he very effectively shows that education is not a sector isolated from social, demographic, economic or political change. Indeed, it is inextricably bound up with changes in these areas. He begins by high-lighting the growing gap between social demand, fuelled by population growth, and the ability of governments to supply sufficient education, let alone education of good quality. Educational pressures brought about by population growth are enormous not only because they lead to urban/rural disparities, but because the rural poor become increasingly disadvantaged. At the same time, however, they throw into stark relief some of the dilemmas facing policymakers. Changing work patterns in the North, brought about by new and costly technologies, are already influencing thinking about the style and content of education. To a lesser extent they are affecting a number of LDCs, but there the political conflict is often between seeking to achieve Universal Primary Education (UPE), thereby raising the overall levels of literacy and numeracy of the population, or of providing more high level qualified personnel. Unfortunately, although educational expansion doubled globally between 1960 and 1980—it expanded in that twenty year period as much as in the whole of previous recorded history—most LDCs expanded their secondary and tertiary provision disproportionately and concentrated their efforts at these levels. As a result there have been high levels of drop-out and wastage, and even on current predictions no developing region (as opposed to individual

countries) will have achieved UPE by 2000 and the numbers out of school will continue to grow alarmingly. Coombs comes up, therefore, with a sound but contentious suggestion.

Instead of looking at the expected numbers of students enrolled and predicting educational expansion accordingly, governments should look at the expected economic resources and fit the educational provision to suit these, rather than the other way round. This is an important point to consider because financial cutbacks in education are occurring at the same time that the unit costs are increasing. As Coombs indicates, there has been a major decline in educational investment in recent years, a situation made worse by inflation in many LDCs. Whether governments will adopt this approach to planning for educational needs and resources remain to be seen.

In the light of the current teachers' dispute in England, Wales and Scotland (a dispute mirrored elsewhere in the industrial world) Coombs' chapter on the dilemmas of teacher salaries and professionalism is both apt and very clear. He points out the stupidity of having a uniform teaching salary structure, irrespective of the ability of the teachers, and argues the case for a fundamental restructuring of the teaching profession by increasing class sizes and by using aides and auxiliaries to help work in a team alongside teachers, but with teachers giving the lead. The team leader should be paid a higher salary, as already happens with a surgeon who depends on junior nursing and other staff to assist him. Some of these ideas were tried out a century or more ago with mixed results, but there is no evidence that they will either reduce the budget or increase teacher professionalism if they are to be reintroduced now.

Two other important aspects of educational development are the *relevance* of what is taught (i.e. the curriculum) and the *quality* of the learning environment. Unfortunately, too little consideration was given to these aspects in the rapid expansion of the 1960s. Coombs offers a useful discussion on both aspects and argues that while it is highly questionable that the 'good old days' were any better than now, too many poor replicas of Western models are to be found in the LDCs with the result that schooling is frequently inadequate for the real socio-economic needs of society. Most changes have merely tinkered with the system rather than bringing about radical reforms. Because schools are very much a part of the economic and political climate of the country it is not always as easy to change them as it is to make them the scapegoats for all the social ills of society.

There are also interesting sections and chapters in Coomb's analysis on education and employment: aid and international assistance and; regional, geographical, sexual and socio-economic disparities which must be taken into account in the context of educational planning. There is also some useful discussion about international influences on the education systems of LDCs over and above local, national and cultural factors. Exponents of dependency theory, as it applies to education, have usually only taken into account the

former, while ignoring the latter. Bray's largely descriptive study of *Educational Planning in a Decentralized System*, shows how both international and country related issues have affected the complexities of educational planning in the context of one specific country, Papua New Guinea. The book begins with a helpful theoretical discussion of the strengths and weaknesses of decentralised educational administration before the reader is taken into the detailed situation in Papua New Guinea. Unusually, decisions about decentralisation in Papua New Guinea were as much political as administrative—largely as a means of maintaining national unity and of preventing separatist tendencies amongst the different communities. The very same arguments are generally advocated for greater centralised control in most countries. In tracing the history of decentralisation in Papua New Guinea, Bray points out that there has been a resultant increase in bureaucracy, that there has been a duplication of effort at national and local levels, and that because of the geography of Papua New Guinea there has been considerable difficulty in coordinating local plans, not to mention in controlling the financial escalation. Several major difficulties of decentralised administration in Papua New Guinea have included increased bureaucratisation, a shortage of adequately trained staff and a lack of any noticeable increase in local participation in education. At a time when, in the interests of 'efficiency, access and relevance', international bodies like UNESCO and the World Bank are advocating greater local involvement through decentralisation, the financial and administrative problems created in a country as small, yet as diverse, as Papua New Guinea need to be taken very seriously by other countries considering decentralisation. Bray's analysis suffers because of its failure to be *more critical* of what is, quite clearly, an administratively wasteful system.

A similar criticism about fear of causing offence by being too critical could be levelled at Gimeno's *Education in Latin America and the Caribbean: Trends and Prospects, 1970–2000*. Based on the UNESCO Regional Conference held in Mexico in December 1979, this is a useful comparative education book with some good basic information and comparative data in tabular form, but, as with most UNESCO publications, there is insufficient critical analysis of the situation. There is a good introductory account of the complexities of the Latin American region and educational developments since 1956. There is also a recognition that the expectations for education were over-ambitious, that the enrolment targets were unrealistic and that far from solving the problems of unemployment, many more problems have been created, not least in the sprawling urban areas of Latin America. The analysis of the socio-economic developments of the region is generally fair and some of the structural features of rural poverty are highlighted. Above all, there is an excellent rebuttal of the de-schooling critics of education's role in modern society. As with other developing regions, however, there appear to be unquestioning moves towards greater decentralisation of decisionmaking. Whether, in the light of the Papua

New Guinea situation, this turns out to be a good thing remains to be seen. There is also a growing emphasis on adult education and literacy and the need for greater research. It is these last two aspects which must be examined further.

Coombs has a most useful chapter on 'the tarnished literacy myth'. In the 1950s there was a great belief in literacy as a key to development progress. Levels of literacy became the yardstick for measuring economic development. Anderson's belief that 40 per cent of the adult population needed to be educated at least to the equivalent of primary education before economic 'take-off' was possible became widely accepted in the 1960s and UNESCO and individual governments launched mass literacy programmes. In spite of these—and especially the 89-nation Experimental World Literacy Programme launched in Tehran in 1965—the numbers of illiterates have continued to increase, drop-outs and wastage from the school system remain appallingly high and economic development remains uneven. In his *Literacy in Theory and Practice*, Brian Street challenges many of the traditionally accepted assumptions about literacy, not least Anderson's 40 per cent, on the grounds that different forms of 'literacy' are highly relevant in given societal situations. Literacy, and the use of language and other communications, are very heavily influenced by cultural conventions. He attacks the traditional 'autonomous' model, which argues for several principles from a few specific cases and which argues that illiteracy implies a lack of logic and an incapacity for abstract thought, and instead develops his own 'ideological' model. By using linguistic research to substantiate his arguments, he shows that literacy for specific purposes, e.g. 'academic' language, has subconsciously influenced attitudes to literacy programmes generally and has resulted in wrong perceptions. Street therefore challenges the assumption that language and literature are essential for successful societies. Indeed, there are examples of socio-economic development in spite of low levels of literacy (e.g. nineteenth-century Canada, India, Pakistan), but these merely lend support to the argument that literacy has been used as a means of social and political control. Street tests his views in the context of Iran of the 1970s. This is an interesting case study on rural Iran before the fall of the Shah, showing the attitudes of rural Muslims to Western science and society but he also looks critically at a number of literacy programmes in other LDCs, most notably Tanzania, Cuba and Nicaragua. He concludes that while improvements in literacy can enable greater economic growth and development, literacy is not necessarily a direct cause of development. This is a major challenge to the exponents of the importance of formal education systems in national development and needs to be studied and developed more carefully. Above all there needs to be more research into the linkages of literacy and economic development.

The difficulties of undertaking research in LDCs is the theme of Schaeffer and Nkinyangi's *Educational Research Environments in the Developing World*.

They rightly observe that it is increasingly difficult to undertake educational research generally because of lack of interest and/or lack of financial support, but that because of major investments in education and the need to avert politically disastrous decisions more research data is long overdue. Unfortunately very few countries place a high premium on educational research and it certainly figures low on the list of priorities of international aid agencies. 'What is required in any attempt to enhance the capacity for educational research is a more sensitive understanding of the complexities of the research environment, and a more flexible, multidimensional approach to improving its several components—tasks in which neither the local government nor foreign donor agencies have shown much interest or skill' (p 18).

It is the importance of understanding the socio-economic framework of a country which this volume seeks to address and which is now recognised by World Bank and other donor agencies. The countries examined include Colombia, Mexico, the Caribbean region, Thailand, Jordan, Kenya, Mali and Senegal. While every situation is unique, with the result that it is almost impossible to establish a uniformity of research models in this volume of essays, and while the relationships between government, research institutions and individual researchers vary from cooperation to indifference, the overriding impressions from most LDCs are how little educational research is taking place and how few political or administrative decisions are made in the light of research findings. There are too many constraints on carrying out research let alone in disseminating the findings. This is tragic because of the enormous investment in education for the future. Yet it is even more tragic because, with current population predictions, there will be ever-increasing numbers of children in the world to be educated and most LDC governments can neither afford to ignore education nor to accept the status quo. It is here that international cooperation and research have such important roles to play. Perhaps it is fitting, therefore, that the final words should go to Coombs:

This much seems clear, international cooperation in education and research cannot be expected to alleviate overnight the immediate problems, but with determined and well-directed efforts it can be expected to contribute significantly in the long run to a saner and more secure world in which all people, in all countries, can with greater confidence aspire to and work toward a better quality of life (p 335).

This may be a pious hope, but all the books reviewed indicate some areas where there can be greater cooperation and where lessons can be learnt. There are dilemmas necessitating policy decisions; but disillusionment with education should in no way invalidate its importance or the need to continue to increase investment, research and planning.

In September 1985, the Commonwealth Institute in London mounted a very successful exhibition of the latest works of the brilliant Nigerian artist, Obiora Udechuku. These works, which were made up of watercolours, pen and ink drawings, lino-cuts, etching and lithographs, focused exclusively on dimensions of the current tragedy of the African famine. The exhibition was appropriately called 'The Rhythms of Hunger'.

In a statement released to coincide with the occasion, Udechukwu recalled the contents of a letter he had received from an American who wished to purchase an item of his art. The prospective client insisted that she 'would be interested in something with people, *but nothing too much about unpleasant situations or things*. I shouldn't say that because some of your finest pieces reflect the famine or thirst of some very unfortunate individuals. My heart goes out to them through your work.' (emphasis added). In his own response, Udechukwu observed:

Her feelings . . . typify the dilemma of the *fortunate* especially among the ruling elites of

BOOK REVIEWS

the world. They recognise the suffering of the underprivileged but would do nothing to correct the socio-economic systems and development programmes that continue to perpetuate injustice and deprivation. It is ever so convenient to give alms, to donate to charity and quickly move your eyes and thoughts to more pleasant things. I do not think that many ever wonder what it would be like exchanging places with the 'unfortunate'. (emphasis added).

The African famine is surely one of the worst human tragedies of the century. But the response of the world to the catastrophe, particularly by Western governments, has been slow and half-hearted. Despite the early warning signals of impending disaster given by governments and aid workers in Sahelian Africa, and the Horn, as far back as 1982, not to mention irrefutable satellite pictures derived from scanning the affected territories, it still required a globalised high-tech concert organised by pop stars in London and Philadelphia in the summer of 1985 to stir the conscience of the world to the disaster.

While this initiative helped tremendously to send relief aid to millions of starving people, it has however tended to obscure the fundamental causes of the famine; the pop fiesta has unfortunately limited our comprehension of this calamity within the threshold of a charity show. Consequently, those governments and agencies (especially Western states and transnational corporations, and most African regimes since 1960) whose age-long harsh economic exploitation of the African peasantry has clearly created the condition for the famine, have conveniently taken refuge in this charity extravaganza.

Graham Hancock, Dessalegn Rahmato and James Firebrace (with Stuart Holland) have in the titles under review here ripped aside the Charity Curtain of the African famine to investigate the often complex historical and prevailing social conditions that have given rise to the emergency. They concentrate their studies on the Horn of Africa.

Hancock recalls the horrors of the Ethiopian famine of the 1970s (conservative estimates indicate that 200,000 people died in Wollo and Tigre provinces between 1972-4) which led to the overthrow of the country's ancient absolutist monarchy headed then by Emperor Haile Selassie. This gave birth to the Ethiopian Revolution in 1974 which was spearheaded by radical army officers known as the *Dergue*. Before the revolution, two-thirds of the land was controlled by feudal landlords whose main allegiance was to the Emperor. The majority of peasants worked as serfs or on crowded smallholdings.

With the success of the revolution, the *Dergue* nationalised all land, and initiated a wide-ranging land reform programme which gave land to millions of peasants. The archaic and oppressive feudal system of production was disbanded. Dessalegn Rahmato's text, *Agrarian Reform in Ethiopia*, is an excellent study which furnishes the details of the historic 1975 reform

programme. He also refers to the successful literacy campaign conducted in the countryside during the period. Only 7 per cent of the Ethiopian population could read and write when the *Dergue* came to power. Ten years later, after the first phase of the literacy exercise, 63 per cent of the people had become literate. The *Dergue* hoped that this crucial development, coupled with its success in confronting land redistribution would radically increase the involvement of the broad sectors of the population in the political process.

But as Hancock notes (p 34), 'The challenge for the future, however, is to take land reform beyond simple redistribution into increased productivity—a goal that has so far not been achieved, with large parts of the agricultural sector over the last ten years.' In addition, Ethiopian agriculture has yet to undergo a radical restructuring, away from the cash crop export-oriented character typical of former Third World colonies and semi-colonies. This is the situation that has created the chilling paradox whereby Ethiopian coffee continue to flood Western commodity markets, while millions of Ethiopians starve to death. Those peasants who produced food are still paid a paltry sum of money for their crop by state agents. Again, another typical malady perpetrated by African regimes who are all too keen to subsidise urban populations at the expense of the peasant majority in the rural areas.

Western governments' hostility to the Ethiopian regime's ideological orientation (particularly in relation to its foreign policy) explains the overall lack of interest of the West in allocating long-term aid to rehabilitate Ethiopian agriculture after the devastation of feudal production and the famine. The overthrow of Selassie cost the West the loss of a major strategic ally in the Horn of Africa. As Harold Marcus points out (in *Ethiopia, Great Britain, and the United States, 1941–1974*), the revolution forced the Americans to evacuate a huge military communication base in the country which was linked to US naval surveillance activities in the Indian Ocean. The Americans, especially since Reagan came to office, have not been in the mood to establish a relationship with the new Ethiopian administration.

However, it is the *Dergue's* scorched earth military campaigns against subject nationalities in Eritrea, Tigre, Oromo and elsewhere that has exacerbated the current emergency in the country. The effects of this campaign on Eritrea and the stubborn resistance of the province's main revolutionary organisation, the EPLF, are well documented in *Never Kneel Down*. The authors, James Firebrace and Stuart Holland visited Eritrea in April 1984 to study a conflict that had been going on for twenty-four years. They chronicle the experience of a people who have embarked on the most advanced social reconstruction that has yet been seen anywhere in Africa since the destructiveness of Western imperialism.

Apart from pinning down thousands of Ethiopian troops who have repeatedly failed to destroy the Eritrean Revolution in the two decades, the Eritreans have launched a developmental programme based on popular

participation, in spite of enormous difficulties. Health care and education are remarkable and the level of literacy is higher than that of several other independent African countries. The liberation of women has been a crucial factor in societal transformation; women not only participate in combat, but also work as doctors, agronomists, teachers and engineers. Given its *genuine* popular base, the EPLF has been able to cope much better with the exigency of the present famine than either the Ethiopian government or other regimes in the Sahel. No doubt, *Never Kneel Down* is an important addition to the rapid growth of literature on the Eritrean Revolution. It is a struggle that the Dergue must now know it cannot crush.

If there is an occupational group that has become most vulnerable as a result of the African famine, it is the pastoralists. The delicate ecological balance that maintains the symbiotic relationship between pastoralists and agriculturalists has been violently disturbed: for the herdspeople to survive, they are forced to embark on ever more desperate far-flung marches in search of ever diminishing pasture. Peter Rigsby's study of the Ilparakuyo Massai pastoralists of Tanzania (*Persistent Pastoralists*) breaks new theoretical grounds. Rigsby notes that contrary to 'conventional' scholarship, which regards pastoralism as a 'residual' pre-agricultural occupational culture which is inexorably subject to extinction, pastoralists have been able to develop and consolidate non-exploitative relationships which have fundamental consequences for future social transformation in those African countries where they exist. Rigsby's important findings will undoubtedly elicit a major debate on a group that some commentators have termed 'Africa's endangered species'.

Information for Authors

Third World Quarterly welcomes contributions on important Third World matters; preference will be given to those which deal succinctly with an issue which is both important and clearly defined. Articles which are narrative or descriptive and lacking in analytical content are unlikely to be accepted. Comparative articles are welcome but should incorporate a balance of empirical evidence and theoretical speculation. The writing style should avoid academic jargon and colloquialism, and manuscripts should be carefully checked for errors. Brief articles (2,000 words) dealing with a single point, setting out results or research, a conference report or comments on a previous article, are also welcomed.

Articles submitted to *Third World Quarterly* should be original contributions and should not be under consideration by any other publication at the same time: if an article is under consideration by another publication the author should clearly indicate this at the time of submission; if published in *Third World Quarterly* it cannot be reproduced in whole or substantial part elsewhere without permission from the Editor of *Third World Quarterly*. The Editor is responsible for the selection and acceptance of articles, but responsibility for errors of fact and opinions expressed in them rest with their authors. Copyright in articles published in *Third World Quarterly* is retained by the journal.

Full names of the authors as well as academic and professional affiliations should be given together with the full address to which correspondence should be sent.

Authors are not expected to correct proofs of accepted articles. Every effort will be made to avoid errors and contributions will be checked at both galley and page-proof stages.

Authors are entitled to twenty-five offprints and five copies of the issue in which their article appears free of charge.

Presentation of Manuscript

- Authors should submit two double-spaced typed copies (in English) on one side of A4 opaque paper. An additional copy should be retained by the author as manuscripts are not returned to authors.
- The length should not normally exceed 5,000 words. Titles should be kept as brief as possible.
- An abstract should be submitted with the manuscript; this is to comprise a one-paragraph summary of the main points of the article in not more than 150 words.
- Allow one inch margin on left-hand side and number manuscript pages consecutively throughout the manuscript. Broad divisions and section headings should be clearly marked where appropriate.

INFORMATION FOR AUTHORS

- Footnote numbering should be clearly marked in the text and the notes placed at the end of the manuscript, not at the bottom of the relevant page.
- Tables (including graphs, maps, figures) must be submitted in a form suitable for clear reproduction on a separate sheet of paper and not within the text. Each table should have a brief descriptive title. Place all footnotes to a table at the end of the table. Define all data in the column heads. Every table should be fully intelligible without reference to the text. If camera-ready artwork cannot be provided by the author, our printers can undertake the preparation of tables within certain financial constraints.
- If any figure, table, or more than a few lines of the text from previously published material are included in a manuscript the author *must* obtain written permission for republication from the copyright holder; the original source should be clearly noted and acknowledged.
- For punctuation, spelling and style, follow the *Oxford English Dictionary* and the *Oxford Dictionary for Writers and Editors*.

Footnote Style

- In the case of books, the author, title of the book, place of publication, publisher, date of publication, and page numbers should be given in that order: e.g. J S Kirk, *Middle East on Trial*, London: Bodley Head, 1977, pp 3-9.
- In the case of articles, the author, title of article, name of the journal, volume number, issue number in brackets, the year and the page numbers should be given in that order: e.g. J Birks, 'Migration in the Middle East', *Middle East Review* 5 (4) 1979, pp 27-32; or in the case of articles/chapters within books: J Birks, 'Middle East Labour' in *Middle East Today*, S Sinclair (ed), London: Frank Cass, 1978, pp 28-36.
- Reference to privately circulated or mimeographed material should also contain full references including the name of the appropriate department of the institution concerned.

Third World Quarterly will do everything possible to ensure prompt publication once a contribution is accepted. This will be facilitated if all manuscripts and illustrations conform to the form and style detailed above. Manuscripts that do not follow this format may be returned for resubmission.

Authors are strongly advised to examine issues of *Third World Quarterly* in conjunction with the reading of these notes.

Deletions and Alterations

If the Editor is of the opinion that articles provisionally accepted for publication need to be shortened or particular expressions deleted or rephrased, such proposed changes will be submitted to the author for approval prior to publication. Corrections of errors in punctuation, spelling and style will *not* be submitted for approval if they do not alter the meaning or sense of the original manuscript.

INFORMATIVE

STIMULATING

CHALLENGING

New thinking on the theory and practice of development

Are you interested in developing countries? Do you want to keep up with theoretical debates about development but haven't time to read the scholarly journals? Do you want to find out where theory and policy meet? The *IDS Bulletin* is a unique source of information for those interested in the Third World and its problems — because each issue deals with a particular theme, it provides an entry to current debates — because the articles are written by people who are involved in both theory and practice, it combines both perspectives.

Recent issues cover:

Research on rural women; Developmental states in East Asia; UNCTAD: the first twenty years; Educational research; Restructuring in the 1980s; The Western Hemisphere in the World Crisis; Sub-Saharan Africa, and Disarmament and Development.

New from the Third World Foundation

SHARED HORIZON

Edited by
Altaf Gauhar

**Does the world share a common
view on how best to work for
peace and development?**

Through a series of interviews conducted by Altaf Gauhar with seventeen internationally renowned and widely respected political leaders, economists and senior members of multilateral organisations, Shared Horizon addresses such issues as nuclear proliferation, growing authoritarianism and military rule, the debt crisis, recession and protectionism and the future of the North-South Dialogue.

By attempting to elucidate the issues that lie behind the most pressing political economic and social problems of our time Shared Horizon provides its readers with the unique opportunity of assessing how leaders of thought from both the North and South view the chances of achieving a global society more closely aligned to the needs of the vast majority of the people.

Shared Horizon is the sequel to Talking About Development also published by the Third World Foundation.

Notes on Contributors

Oliver Tambo is the President of the African National Congress (ANC) and Chairman of its Political-Military Council. Having become a member of the ANC's National Executive in 1949, he held successive posts in the organisation, while establishing with Nelson Mandela in 1952 the first African legal partnership in South Africa. Charged with high treason in 1956, and subject to a series of banning orders, he was in 1960 directed by the ANC National Executive to leave the country, and to continue to mobilise international support against apartheid, while in exile.

Laurence Harris is Professor of Economics and Head of the Economics Department at the Open University, England. His publications include *Monetary Theory* (1980); *City of Capital* (1983); and *New Perspectives on the Financial System* (forthcoming).

James Painter is a researcher and writer at the Latin America Bureau, London. His publications include *Political Change and Continuity in Paraguay in the 1970s* (1983) and (co-author) *Honduras: State for Sale* (1985).

Paul F Power is Professor of Political Science at the University of Cincinnati, Ohio.

Abbas Alnasrawi is Professor of Economics at the University of Vermont, in Burlington, and Executive Secretary of the Middle East Economic Association. He is the author of *Financing Economic Development in Iraq* (1967); *Arab Oil and US Energy Requirements* (1982); and *OPEC in a Changing World Economy* (1985).

Cheryl A Rubenberg is Associate Professor of International Politics at Florida International University, North Miami. Her publications include *The Palestine Liberation Organisation: Its Institutional Infrastructure* (1983) and *Israel and the American National Interest: A Critical Examination* (forthcoming in 1986).

D Michael Shafer is Assistant Professor of Political Science at Rutgers University, New Brunswick, New Jersey.

NOTES ON CONTRIBUTORS

Dragoslav Avramovic is Economic Adviser to the Bank of Credit and Commerce International SA. He was the Director of the Secretariat of the Independent Commission on International Development Issues (Brandt Commission). His publications include (ed) *South-South Financial Cooperation: Approaches to the Current Crisis—Jamaica Papers* (1983) and *Developing Country Debts in the Mid-1980s: Theory and Policy* (1985).

Keith Griffin is President of Magdalen College, Oxford. Was formerly Warden of Queen Elizabeth House and Director of the Institute of Commonwealth Studies, Oxford. His publications include (co-author) *The Transition to Egalitarian Development* (1981); *Land Concentration and Rural Poverty* (1981); (ed) *Institutional Reform and Economic Development in the Chinese Countryside* (1984); and *World Hunger and the World Economy* (forthcoming in 1987).

Trevor Petch is Editor of the Central America Information Service. *Belize Briefing*.

Walden Bello is an Associate Fellow of the Institute for Policy Studies in Washington DC, and Co-Director of the Philippine Human Rights Lobby. He is principal author of *Development Debacle: the World Bank in the Philippines* (1982) and co-author of *An American Lake: The Nuclear Peril in the Pacific* (1986).

Harold Blakemore is Reader in Latin American History and Secretary of the Institute of Latin American Studies, University of London. He is Co-Editor of the *Journal of Latin American Studies*, London.

Esperanza Duran is a Fellow of the Royal Institute of International Affairs, London.

Philip Alston is Associate Professor at the Fletcher School of Law and Diplomacy in Boston, and a Visiting Professor at Harvard Law School.

Unmasking neo-apartheid

Apartheid, it seems, has no supporters left. The desire to end it is all-consuming; the only disagreement is whether its opponents call themselves 'reformers' or 'abolitionists'. However, closer examination reveals that the 'reformers' do not oppose apartheid at all; they want it to adapt, adjust and survive. This is hardly surprising considering that the State President of South Africa, P W Botha, is a self-professed 'reformer', his words welcomed by President Reagan and Prime Minister Thatcher who are ardent 'reformers' themselves.

Now that apartheid is stigmatised as a term of abuse, its original architects and proponents want to distance themselves from the word as much as possible . . . 'apartheid is outmoded', 'apartheid no longer exists'. What they want to create instead is a streamlined, renovated neo-apartheid which they hope no one will recognise as such; a system which will somehow reconcile black rights with white power. The fact is that they are irreconcilable. The struggle was never limited to benches, beaches and toilets; the real leaders of South Africa want nothing less than majority rule: one man, one vote, 'a South Africa which belongs to all who live in it'. Accepting anything less would mean cooperating with 'reform', becoming the black oligarchy which the white minority in Pretoria hopes will have as much stake in neo-apartheid as they do.

The 'reformers' have been unsparing in their use of violence. More than 1500 blacks, including children, have died since the process of 'reform' began in earnest in August 1984. Even as they perpetrate and support state violence in black townships, the white minority regime in Pretoria still warns of the deluge which would follow black rule. The fear is that blacks must have kept score of the injustice and violence they have suffered over decades and, it seems impossible to those whites who have supported apartheid, that this will not bring eventual vengeance. 'We have worked in the white man's kitchen. We have brought up his children, we could have killed them any time we wanted to.' This is a difficult statement to read, and it must have been a difficult statement for Winnie Mandela to make because it could so easily be misinterpreted as a threat to murder all white children in the care of blacks. It is not. It is an affirmation of the self-control and restraint which this oppressed majority has exercised. It underscores the fact that without the blacks' sense of responsibility and humanity, white control in itself was never enough to have prevented this happening. Blacks have continually behaved with restraint, but now they also have an awareness of their power.

When Archbishop Tutu finally called for punitive economic sanction against South Africa in April 1986, he said:

'Apartheid is irreformable. It must be destroyed before it destroys our country. . . . I have no hope of real change from this government unless they are forced. We face a catastrophe in this land and only the action of the international community by applying pressure can save us. Our children are dying. Our land is burning and bleeding.'

Archbishop Tutu's appeal to the international community was directed primarily to those countries whose sanctions would make the greatest impact on South Africa. The seven major democracies, as they describe themselves, ended their annual economic summit in Tokyo in May 1986 with a strong condemnation of terrorism which they pledged to fight relentlessly and without compromise through 'determined, tenacious, discreet and patient action combining national measures with international cooperation'. The US Secretary of State, George Shultz, exulted in Reagan's triumph of 'isolating' Libya which was singled out by name as a source of state terrorism. South Africa, which more aptly fitted the description of terrorism as ignoring the 'values of human life, freedom and dignity' was neither mentioned nor considered in this context. (Although it was reported that Mrs Thatcher wanted the assembled leaders to express a concern that the rights of the white minority in South Africa should be protected.)

The signatories of the Tokyo communiqué are responsible for the vetoes which have prevented the Security Council from applying mandatory economic sanctions against South Africa under Chapter 7 of the United Nations Charter. The net effect of this has been to weaken international support for sanctions because even those states which support sanctions are unwilling to take national measures on the grounds that in the absence of a Security Council decision their national measures will have little effect. Whatever national measures have been taken recently by Western countries have been in response to mounting domestic pressure to disinvest from South Africa. Left to themselves the Western governments were quite happy to welcome P W Botha to Europe in 1984 when he first became a 'reformer' and inaugurated his sham Parliament. He visited Britain, Portugal, Switzerland, Austria, France, Germany, Belgium, Italy and the Vatican. Clearly, isolating the apartheid regime is not the highest priority of Western leaders.

It is worth reiterating why economic sanctions are critical to the South African struggle. The apartheid regime is facing a political and economic crisis. The recognised leaders of black nationalism are saying

that the next phase of the struggle which calls for action has come. That they will take on themselves; what they are asking from the international community is concerted action to help them make this phase decisive. Economic sanctions will not destroy apartheid but they will weaken the white minority regime in Pretoria significantly. South Africa is a siege economy whose planners are aware of a future under sanctions and are trying to create an economy able to withstand an economic boycott by the world's governments not just by conscientious individuals. Those plans have made their dependence on foreign finance acute.

Twice before apartheid has faced a crisis of confidence with its lenders which might have marked a turning point in its defeat: after the Sharpeville massacre of 1960 and the Soweto uprising of 1976. Then, as in August 1985, following the State of Emergency and increased repression, the value of the rand fell sharply as capital flight occurred and lenders declined to renew loans. On both occasions the US and the International Monetary Fund stepped in to restore confidence in South Africa's creditworthiness.

In February 1986 as Fritz Leutwiler was mediating a rescheduling agreement between South Africa and her creditors, Archbishop Desmond Tutu and Claude Beyers Naude urged the banks to refuse South Africa relief unless President Botha resigned. By 20 February an agreement between South Africa and the banks was in place. Bankers respond to political pressure when they must but are unlikely to rethink their commitments to South Africa unless their governments impose sanctions and disinvest.

It is a depressing thought that reschedulings will continue with South Africa receiving 'most favoured debtor' treatment, on the pretext that its 'reformist' government must remain open to international influence, thus giving neo-apartheid respite to consolidate itself. The pace of change adopted by 'reformers' is unacceptably slow. It took the US, which considers Marxism a greater threat to the happiness of South African blacks than racism, fifteen years to 'condemn' apartheid in General Assembly resolutions. Until 1960 the US would go no further than expressing 'regret and concern'. It was only after the international outrage provoked by Sharpeville that it had to 'abhor' apartheid with the rest of the civilised world. It is deplorable that an Administration whose Southern Africa policy is based on the premises that South Africa is an ally and the key regional power should be able to play such an important role in helping to shore up apartheid.

Only changes brought about through negotiations with leaders who are presently imprisoned and parties which are banned could be recognised as progress in the direction of a free South Africa. The Botha regime recognises that any such dialogue would imply, however tacitly, that negotiations for a transfer of power to the majority had been initiated. That it will never do and that is precisely what 'reform' without dialogue is intended to circumvent: to quiet black demands without ever meeting them. The view that apartheid must be tolerated a few years or decades longer, while it is encouraged, rather than compelled to change, is a dangerous assurance that the domination of white power will continue. As South African whites look across the border to Zimbabwe, they see an independent African state which is finding even the reservation of parliamentary seats for whites too discriminatory and burdensome a privilege to maintain. What guarantees, they wonder, will prevail under majority rule and how will they enforce them? 'Reform' may ultimately be a losing bet, but, with support from trading partners who refuse to impose sanctions, for the present it is the safer option.

Racism, apartheid and a new world order

Oliver Tambo

Address delivered on receiving the Third World Prize for 1985, on behalf of Nelson Rolihlahla Mandela and Nomzamo Winnie Mandela. The Prize was presented by Dr Mahathir Mohamad, Prime Minister of Malaysia, at the inaugural session of the Second Summit of Third World Scholars and Statesmen, South-South II: Charting the Way Forward, in Kuala Lumpur on 5 May 1986.

The most senior leaders of the oppressed people of South Africa have been in prison for almost a quarter of a century now. They who would have contributed so enormously to the making of a prosperous, happy and peaceful society, whose leadership would have moved millions to strive for the achievement of this goal, these have been condemned to commune only with the prison guards for the rest of their natural lives.

While these titans of freedom pounded rocks and sewed mailbags behind prison walls, those who had issued the command that they should be jailed were busy imprisoning a whole society. They decreed that none shall speak of anything except what the gaolers permitted to be said; that none shall act according to their consciences except with the authorisation of the gendarme. They proclaimed that the truth shall not be told except that which the regime of repression deemed to be the truth. They, on the other hand, would have the right to designate oppression as liberty: those who are enslaved would be described as free men and women, while he or she that dared to fight for genuine freedom would be categorised and treated as a criminal.

We are meeting here today to honour two South Africans, Nelson and Winnie Mandela, who symbolise those prisoners, the first within the narrower and the second, the wider meaning of that term. We meet not to express sympathy either with them or with the millions of people of whom they are part, but rather, to salute and pay tribute to them for their resistance to tyranny. We have gathered here to honour them for their steadfastness in the struggle to give birth to a world in which those of us who are blessed with the skin colour you see on our hands and faces, will no longer be victims of oppression, exploitation and degradation.

The cause for which our people are paying the supreme sacrifice daily and for which Nelson Mandela, Walter Sisulu, Govan Mbeki, Harry Gwala, Ahmed Kathrada, Elias Motsoaledi and others have been sentenced to life

imprisonment, has a significance which extends far beyond the borders of our country.

For, what they are fighting against is the pernicious ideology of racism, the accumulated refuse of centuries of an anti-human prejudice which seeks to define people as inferior, as not fully human, by virtue of their race. They are engaged in struggle to end the practice which gave birth to these ideas, the practice of racial discrimination, racial oppression, domination and exploitation.

Racism, one of the great evils of our time, bedevils human relations, between individuals, within and between nations and across continents. It brutalises entire peoples, destroys persons, warps the process of thought and injects into human society a foul air of tension, mutual antagonism and hatred. It demeans and dehumanises both victim and practitioner, locking them into the vile relationship of master race and *Untermenschen*, superior and underling, each with his position defined by race.

As black South Africans, we have lived within the entrails of the racist beast for many a long year. We have seen constructed a system of social organisation based on the premise and the practice that those who are white are inherently superior and those who are black must, in their own interests, be the objects of policies decided exclusively and solely by the white people.

Quite clearly, this edifice required some pseudo-theoretical precepts to underpin it and give it the appearance of rationality. The theoreticians of racism in our country drew on the gross perversions of science which assumed their clearest forms during the second half of the last century in Europe and the United States. In these centres of imperialist power, there grew up theories that biology and social anthropology provided the basis to justify the notion that all black people carried with them both an innate and a cultural inferiority to the white, giving the latter the right and the duty of guardianship over the former.

Implicit in this thesis is the idea that these higher human beings have a similar right and duty to maintain the purity of the human species up to the point and including the commission of the crime of genocide.

One of the earliest of these racist theoreticians in our country, this century, was none other than General Jan Smuts, who opposed Nazism only because it threatened British imperial power. Speaking amidst the splendour of the London Savoy Hotel in 1917, Smuts had this to say:

'It has now become an accepted axiom on our dealings with the natives that it is dishonourable to mix white and black blood . . . We have felt more and more that if we are to solve our native question, it is useless to try to govern black and white in the same system to subject them to the same institutions of government and legislation. They are different not only in colour but in minds and in political capacity . . .'¹

¹ Quoted in Wilkins and Strydom, *The Broederbond*, London: Paddington Press, 1979.

More than forty years later, when these insulting racist ideas had been translated into the apartheid system, here is what two other theoreticians of this system wrote:

'The three foundation stones of apartheid are Western culture, Christian morality and a specific racial identity. In the case of the Afrikaner, there is a powerful connecting link between these three elements. His own particular bio-genetic character is, for example, associated with a particular socio-cultural way-of-life and to give up either, through amalgamation with a more primitive culture or race must necessarily result in the destruction of the other.'²

Of course the inanities that were being conveyed as bio-genetic and socio-cultural theory, during the second halves of both the nineteenth and the twentieth centuries, were nothing but an attempt to justify a colonial relationship of the domination and exploitation of the black peoples by the whites. They had absolutely nothing to do with scientific truth.

Once implanted, and despite their exposure as fraudulent and bankrupt, these ideas seemed to take on an independent existence, nurtured by the continued practice of white supremacy in many parts of the globe. Originating from practice, they served to encourage the entrenchment, perpetuation and extension of this practice. To emphasise the point that they reflected an immutable natural order of things, the fertile human mind goes further to enrobe these racist ideas and practices with the cloak of religion.

It is indeed in this way that it becomes possible for racism to give those who believe themselves to be superior, the power to challenge the very God they dragoon to serve their interests and whom they claim to worship. Thus, whereas the Christian Scriptures, for instance, see all human beings as having been created in God's image, all racists will, for reasons that are perfectly obvious to them, retort that this cannot be so. And so it is that the foulest of crimes, against life itself, are perpetrated in the name of religion, as is the case in our own country. The idea of a civilising mission, so dear to the earlier missionaries, derived exactly from this view that the European was a higher being deposited on this planet to play God over 'the natives.'

From what we have said so far, it is self-evident that the practical relationship that characterised the interaction between Europe and the colonised world, today's Third World, could not be but a hothouse of ideas justifying this relationship. In its essence, racism is therefore about domination and works both to justify existing domination and to prescribe domination as the *sine qua non* for the solution of all future problems.

Among the objectives pursued by our illustrious host here today, the Third World Foundation, are 'to assist in the evolution of a fundamentally just and

² Pierre van den Berghe, *South Africa—a Study in Conflict*, Berkeley: University of California Press, 1967 quoting N J Rhoadie and H J Venter.

equitable relationship between the Third World and the developed countries' as well as 'to create greater awareness of the problems of poverty, hunger and ignorance in the Third World.'

That it is necessary to address these issues, as indeed it is, attests to the fact that the imbalance of strength, the inequality of power and the incompatibility of objectives that marked the relations between the imperialist powers and the colonised peoples remain to this day. It is not necessary for us to elaborate further on this to those who are gathered here and have to contend with its disastrous consequences daily.

The point we must however emphasise is that it is exactly in these conditions that racism thrives, as it did during the colonial period. Hence we still find current notions that at the base of the 'North-South' dichotomy lies the difference between white peoples in the North who are inventive, industrious and disciplined and the blacks in the South who are innately indolent, imitative and happy-go-lucky.

Western Europe has large numbers of so-called *Gastarbeiter* who are mainly non-European workers from the South. The jobs they do, the squalor in which many of them live, the ghettos in which they are concentrated, once more emphasise the distinction between black and white as well as the lowly position of the former and the superiority and domination of the latter.

Similarly, in the United States, one has only to see the statistics of unemployment, drug addiction, homelessness, single-parent families and so on, to realise the extent to which the black population is marginalised and serves as a living example for the most backward elements to 'prove' the assertion that to be black is to belong to a category of the human species that is less than human and which must be used as befits its status.

All of us present here know that the causes that account for the relationship between black and white, North and South, that we have been talking about, are neither bio-genetic nor socio-cultural. Rather, they are socio-economic and are therefore capable of being changed or removed. Indeed, it is the resolve to bring about 'a fundamentally just and equitable relationship between the Third World and the developed countries' that led to the emergence of such important groupings as the Non-Aligned Movement and the Group of 77.

Those who are interested in an end to racism must necessarily be concerned that these organisations should succeed. In as much as the huge nuclear arms expenditures are incompatible with development, so is the growing relative and absolute underdevelopment of millions upon millions of black people incompatible with the objective of ridding the world of racial arrogance, discrimination and tyranny.

The urgent need for a New International Economic Order has been dramatically illustrated by the famine in Africa, the international debt crisis and the collapse of the price of oil and other raw materials. The hard and continuing struggle for the New Order is fundamentally about the

redistribution of the world means of production, to bring about the economic independence of the Third World and enable its peoples to banish hunger, disease and ignorance for ever, to assert their dignity as human beings and bring fulfilment to their lives. The accomplishment of this objective would itself redress the political imbalance which threatens the independence of many nations, thanks to the extension of the infamous Monroe Doctrine by the present US Administration to cover the entire Third World.

We, the peoples who were objects of imperialist expansionism, for ever the infantile dwarfs who required the benign or brutal patronage of the white superman, in earlier times had to be liberated from the state of noble savagery. Whether this resulted in our transportation across the seas as slaves or in enslavement in our own countries, as subject peoples, was but the unfolding of the manifest destiny.

Today, still the infantile dwarfs as of yore, unable to think for ourselves, inanimate fruit ready for the picking by whosoever has sufficient strength to rule the garden patch, we are being taken under the protective wing of the United States, to save us from falling victim to an alleged communist expansionism.

Angola and Mozambique, Nicaragua and Libya, Grenada, El Salvador and Namibia are the victims of this eminently racist policy which asserts the supremacy of the interests of the United States over those of the peoples of the Third World, which presumes, as General Smuts put it, that we have neither the minds nor the political capacity to exercise the right to self-determination.

It is clear that the fate that has befallen these countries will be visited on even more of us. Over the last few years, we have seen a discernible swing to the right in all the major Western countries, with the dominant social groups infusing public consciousness with the notion that might is right. And, in good measure, we have seen the exercise of white against the black people, be it in street brawls in British or French towns or in the invasion of countries.

Apartheid in South Africa exists as the concentrated expression of the worldwide cancer of racism that we have been talking about. In our country, the ideas and practices of racism reign supreme, as they did in Nazi Germany—the essence and the purpose of state policy, the instrument to effect and guarantee the domination and exploitation of the black majority by the white minority.

Because of its high pedigree in reactionary political thought and praxis throughout the world, the apartheid system serves also as the nursery for the cultivation and propagation of the same man-hating policies which the United Nations Organisation was formed to stamp out. It is because there is today widespread recognition of this reality that there exists that important instrument of international law—the Convention for the Suppression and Punishment of the Crime of Apartheid, which defines apartheid as a crime against humanity.

We assert it as an incontrovertible truth that mankind is under an obligation to suppress and punish this crime against humanity. On the basis of the experience of our own people of the horrendous practice of racism, we can categorically state it here that this crime cannot be suppressed by means of words or by persuading its perpetrators to desist from the commission of a crime.

Racism, the theory and practice of the domination of one race by another, and specifically its apartheid expression, cannot be reformed. Like Nazism, its antecedent and sister crime against humanity, it must be overthrown and uprooted forcibly, in its totality. Those who argue to the contrary and even claim that the Pretoria regime has embarked on reform, are either grossly misled or are bent on protecting the regime of racial tyranny by seeking to refurbish its image to make it more acceptable.

In any case, a cancer cannot be its own cure. The fanatical racists who have spent more than half-a-century drawing up the blueprints of the apartheid system and transforming those theoretical constructions into the South African society we know today, cannot, at the same time, be the agents for the abolition of that system.

All they know and will ever know, is the need to maintain the system of white supremacy, and to maintain it by the use of all the violence that they can muster. Today our people are dying in large numbers, murdered on the orders of Pretoria's army and police generals. The blood-letting continues without reserve because, after all, those that are being killed are, in the eyes of the generals, lesser beings who can be disposed of without compunction, because they are less than human. Some Western governments are pleased to describe this as the maintenance of law and order!

The same mentality and objective of the defence of white minority domination, has instructed and continues to inform the attitude and policy of the Pretoria regime toward the frontline and other independent countries of Southern Africa. Its regular forces as well as its armed puppet formations have wrought untold damage especially on the peoples of Angola and Mozambique, with an enormous loss in human lives. Racism cannot accept any relationship between black and white except that between servant and master. Southern Africa will know no peace until the apartheid regime in South Africa is defeated and the system it upholds destroyed.

When the day dawns, only then will the full horror of the genocide being carried out in the Bantustans become visible for all to see. Whereas the Nazis resorted to the gas chamber to annihilate peoples they considered superfluous and no better than vermin, the Pretoria regime has used the method of death by starvation to carry out its mission of purifying the human race. The destruction of a system that has as one of its corner-stones such deliberate mass murder, is surely long overdue.

Yet the reality of the perpetration of racism in South Africa is that the

apartheid regime is supported by the same forces which, during the last century, deemed that the perspectives held out by the French and the American Revolutions were not for the colonised. The dominant forces in the major Western countries do this not despite the system of apartheid, but because of it.

They support racism because it expresses the imperative of the systems they represent, namely, to dominate, and serves their purposes as an instrument for the extreme exploitation of those who are dominated. For these reasons, they spurn our appeals for comprehensive sanctions against apartheid in South Africa, which we repeat today and urge upon the world community as the most effective means to bring about change in our country with the minimum of violence and destruction.

It was not a slip of the tongue but a frank admission of the truth when Ronald Reagan characterised the apartheid regime as an ally of long standing. His policy of constructive engagement with apartheid represents an engagement with racism that arises from the nature of imperialism—an engagement which, in the context of his goal to dominate the Third World, is constructive because it helps to strengthen the allied apartheid regime.

True to character, the Reagan Administration and others in the West, make certain whenever they address the question of negotiations to resolve the conflict in our country, that they put the supposed interests and aspirations of the white minority first. They turn their own national experiences of political change on their heads in order to serve the cause of racism in South Africa.

For example, it is argued forcefully that it is inappropriate and unreasonable for us to demand that all South Africans, both black and white, should have an equal right to elect the government of their choice—in other words, to have a system of one person one vote in a unitary state. Similarly, it is argued that it is we, the victims of the violence inherent in the apartheid system we who have to bury murdered children every day, who must lay down arms and cease our armed struggle to make negotiations possible. Countries which are proud of the armed revolutions which brought their peoples democracy are, because of their support for the racists, equally fervent in their denunciation of our armed combatants as terrorists.

Likewise, we must renounce all claims to the national wealth of our country, which we have created with our labour, because, by some queer logic, to say that the wealth of the country must be shared by all the people is, in the South African context, to threaten the human rights of the white minority.

From Washington, London, Bonn and Paris issues the call that it will be absolutely vital to safeguard the rights of the white minority. And yet from all these, which pride themselves as the centres of democracy, there is never a word about the rights of the majority—the non-racial majority! Instead, these centres of democracy are engaged in a desperate bid to find flunkys and collaborators from among the black people who will be imposed on us as our

true representatives and paid for their services, in order to preserve white privilege.

But certainly, no amount of political manoeuvring or killing of our people will blunt or stop the offensive of our masses, under the leadership of the African National Congress, to destroy racism in our country. Already the realisation is abroad among our people that victory is in sight.

It is a victory that we will use to build a truly democratic South Africa, one in which we shall abolish racism once and for all, and end the unjust and unequal relations of domination and exploitation that exist between black and white in our country today and which are expressed in the concept and the practice of apartheid.

By that means, we shall also make our contribution to the struggle for a just and equitable international political, economic and social order and add as much as we can to the construction of a new world, free from racial discrimination and oppression, free from hunger and poverty and free from the threat of the termination of life itself through the use of nuclear weapons in a Third World War.

We count ourselves fortunate that we have among our people such outstanding humanists as Nelson and Winnie Mandela, as well as others such as Albertina Sisulu, Greta Ncapai, Dorothy Nyembe, Thandi Modise, Frances Baard, Vesta Smith, Amanda Kwadi, Barbara Hogan and Marion Sparg, people who hate racism and love all humanity enough to be prepared to die in the defence of liberty of all persons, regardless of their colour or race.

We are proud that we come of a people that, like all others, is not prepared to tolerate evil and acquiesce in the perpetuation of tyranny. In their names, we are happy to receive this eminent prize. We thank the Third World Foundation and all who are associated with it for having so honoured us. This prize will serve as a further spur for us and, we are certain, for the rest of humanity, to redouble our efforts to free all the political prisoners in our country and to liberate the millions of our people who are held hostage by a racist clique.

IN MEMORIAM

RAÚL PREBISCH
1901–1986

Dr Raúl Prebisch, the renowned Argentine economist, who won the first Third World Prize in 1980, died on 29 April 1986, near Santiago, Chile, at the age of eighty-five. The Third World has lost a fervent champion, and the world at large has lost an innovatory scholar.

Raúl Prebisch maintained that the cause of Latin America's underdevelopment was its position in the periphery of the world economy, which resulted in unequal terms of trade and a chronic deficit in its balance of payments. He proposed protectionist policies to stimulate industrialisation—'inward development'. His pioneering work formed the basis for dependency theory—a school of thought which effectively dominated Latin American economic thinking until the mid 1970s. Under Dr Prebisch's leadership, these ideas gave shape to concerted demands by developing countries for a New International Economic Order, notably under the auspices of the United Nations Conference in Trade and Development (UNCTAD). He was a passionate advocate both of co-operation among developing countries, and of regional economic integration within Latin America.

Born on 17 April 1901, in Tucuman, Argentina, Raúl Prebisch was educated at the University of Buenos Aires, where he completed his doctorate at the age of twenty-two, and became Professor of Political Economy in 1925. He taught at the University of Buenos Aires until 1948, and during this period occupied a succession of posts in Argentina's public affairs, including: Deputy-Director of the Department of Statistics (1926–7); Director of Economic Research at the Banco de la Nación (1927–30); Under-Secretary of Finance (1930–2); Adviser at the Ministries of Finance and Agriculture (1933–5); organiser and first Director-General of the Central Bank of Argentina (1935–43). In 1948, following disagreements with General Perón, he was obliged to seek exile abroad.

Extending his career into the realm of international affairs, Raúl Prebisch became Executive Secretary of the UN Economic Commission for Latin America (CEPAL) (1948–62), and was Director-General of the Latin American Institute for Economic and Social Planning (1962–4 and 1969). During this time he published his influential work, *The Economic Development of Latin America and its Main Problems* (1949) and fostered the creation of the Latin American Free Trade Area (LAFTA) and the Central American

Common Market (CACM). In 1964, his contribution to the establishment of the UN Conference on Trade and Development (UNCTAD) as a standing body was recognised in his appointment as the first Secretary-General of UNCTAD, a post which he held until 1969. In 1973 he was appointed adviser to the UN Secretary-General on development problems, and acted as the Under-Secretary General responsible for UN emergency operations designed to assist those developing countries most affected by the 'oil price crisis'. He became Director of *CEPAL Review* (Santiago, Chile) in 1976, and, ending his exile in 1984, with the installation of democratic government in Argentina, returned as adviser to President Raúl Alfonsín.

South Africa's external debt crisis*

In London on 20 February 1986, an extraordinary meeting of bankers approved, in principle, terms for rescheduling outstanding debts owed by South Africa to foreign bankers. Since the end of the 1970s the world has seen many countries enter into such negotiations on outstanding debts and agree 'rescheduling' terms with their bankers, but this meeting fully deserved the special attention it received, for South Africa's debt crisis is unique.

Its outstanding special feature is the dominant role played by political developments; the impasse of apartheid, the fragmentation of the forces that traditionally bolstered it, and the prominence of the anti-apartheid forces. Most countries' debt negotiations involve some political element and are shaped by the interplay of domestic and international political forces. In some cases these have been very prominent. The rescheduling of Argentina's debt after the Malvinas/Falklands war and of Poland's after the announcement of martial law have been the most notable precedents. The negotiations over Brazil's, Peru's, Mexico's and other countries' external debts in the first half of the 1980s have also been strongly influenced by political developments in those countries. Nevertheless, the exceptional significance held by political developments makes South Africa's debt crisis a special case.¹

Since the problem became acute in the summer of 1985, the politics of black township revolts, black trade union unrest, African National Congress (ANC) actions, President Botha's contradictory stance on reform and anti-apartheid sentiment in the US and Europe determined its course. In October 1985 the *Sunday Times* reported 'Businessmen and bankers inside and outside South Africa are united in believing that the crisis and its resolution are political not economic'² and they appeared

* This article is based on the author's work carried out at the Open University within the Financial Studies Research Group and the Development Policy and Practice Research Group.

¹ Although commentators emphasise the political factors and note that in 1985 South Africa had a surplus on current account enabling it to service its debt, 'normal' economic factors were also significant. The current account had been in deficit over several years and, as outlined below, other economic problems were serious.

² *Sunday Times* (London) 1 September 1985.

largely correct, at least regarding its immediate causes. In 1985 the debt crisis emerged not because of an immediate shortage of export earnings with which to service the debt, as with many other economies, but because of foreign creditors' reactions to the State of Emergency declared in July 1985.

A second special feature of the crisis was the nature of the debt itself. When Third World countries have been forced to reschedule their liabilities, the debts at the core of the problem have commonly been 'sovereign debt', the direct or indirect liabilities of the state, and most have been medium-term loans that, as a result of economic circumstances, the state has found it difficult to service. By contrast, South Africa's problems centred on the renegotiation of credit to private enterprises and a high proportion of this credit was short-term credit arranged through foreign banks lending to South African banks. The significance of this type of debt over recent years had, in turn, arisen largely as a result of political pressures against more 'regular' credit facilities.

The third unusual feature of South Africa's debt crisis has been the appointment of an 'intermediary' to produce a solution (at least a temporary one) instead of the usual negotiating machinery. This, too, was prompted by the political sensitivity of the issue, although some bankers now feel that it may become a model for other countries with debt problems.

Although South Africa's debt problems are unique in these ways, there are, too, several elements that are common to many countries' experience. Although (following austerity measures in 1984) the current account of the balance of payments has been in surplus, the economy has suffered a severe recession like that which has compounded the difficulties of other debtor nations. Although the international banks have been subject to pressure from their shareholders and depositors against supporting apartheid, they have largely been as much influenced by normal considerations of banking prudence. And although their central banks are sensitive to political and diplomatic problems, their concerns in the debt negotiations have been to prevent disruption to the international banking system.

In this paper I describe the development of the debt crisis over seven months, from July 1985 when South Africa declared a State of Emergency in the face of black rebellion to the end of February 1986 when the leading banks met the 'mediator' in London to agree a temporary solution. I then consider the relative roles of the

characteristic political and economic factors and conclude with an assessment of the future role of the debt problem.

Economic impact of the state of emergency

On 20 July 1985 the government of South Africa declared a State of Emergency under which it detained hundreds of anti-apartheid activists (who claim to have been tortured in many cases), banned independent media coverage of clashes and gave *carte blanche* to the security forces. It was an attempt to quell the unrest in which some 450 people had been killed by police, rioters and ANC militants in the previous ten months. Above all it was an attempt to break the multiracial United Democratic Front, a broad-based front of popular organisations generally supporting similar aims as those of the ANC.

Similar political crises had had dramatic economic effects; the 1960 State of Emergency imposed after Sharpeville was followed by a severe, but temporary outflow of foreign capital and drop in reserves and the 1976 Soweto riots also led to an outflow, especially of short-term capital. But in this case the authorities took the view, at least in public, that the emergency would have no financial effects: the Governor of the Reserve Bank (central bank) Gerhard de Kock 'said he did not think the [emergency] measures would materially affect the economy . . . He did not see a net increase in capital outflow.'³ This public confidence was misplaced, for a financial crash developed in the following days. It was prompted by the twin shocks of the State of Emergency and the French government's announcement, a few days later, of restrictions on French investment in South Africa.

The crash was felt principally on the Johannesburg Stock Exchange and the foreign exchange markets as investors switched money out of the country. In the week after the emergency measures were announced the market value of shares on the Johannesburg Stock Exchange fell by 11 billion rand with brokers describing the wave of selling, principally from the US, Britain and France, as a 'bloodbath'.⁴ In particular, there appeared to be a big move out of gold shares into similar investments in Australia and Canada (although this was moderated by the fall in the exchange rate of the rand which bolstered the profit expectations of gold companies). The gold mines share index fell seventy-two points in

³ *Citizen*, (Johannesburg) 23 July 1985.

⁴ *Star* (Johannesburg) 28 July 1985.

a week to a three-year low of 332. The panic gathered during the week with increasingly hectic selling; the number of bargains struck was estimated at some 3.5 million per day at the start of the week but at over 5 million on Thursday and Friday.⁵ The flow of money out of the country pushed the exchange rate of the rand down to 43.5 US cents by the end of July from the price of 52 US cents at which it had stood at the beginning of the month.

The sharp sales on the stock market and foreign exchanges were not themselves mainly withdrawals of foreign loans, i.e. credit from abroad. But they were stimulated by fears that the political crisis signalled by the State of Emergency and the French measures would lead major banks to withdraw lines of credit from businesses in South Africa. A large proportion of international banks' loans to South African industry was due for repayment at the end of August and the panic in the last week of July was fuelled by rumours that Chase Manhattan, Citibank, and some others would refuse to renew those loans.⁶ These rumours accentuated the fall in the rand as firms rushed to buy dollars (sell rands) forward for delivery in a month expecting they would need the dollars to repay their unrenewable loans. Indeed, the truth of the rumours was quickly proved when Chase Manhattan confirmed it would not roll over its loans to the private sector (several years previously the same bank had withdrawn from lending to the South African state). Other banks followed, with Barclays announcing in mid-August that it planned to reduce its South African interests.

Whether or not the government believed its own public pronouncements that the State of Emergency would have no economic effect, there is no doubt that the financial crisis was severe. Business and other interests combined to press for action to be taken to prevent it worsening. Three options were under discussion: a moratorium on debt repayments; exchange controls on outflows of capital and price disincentives in the form of a two-tier exchange rate; and political reforms to satisfy foreign bankers. The first two were strongly out of favour with banks and business because, to different degrees, they would reverse the recent years' trends toward increased freedom for markets. All hopes were pinned on the third option, political reforms. As a result, the speech which President P W Botha was to make on 15 August 1985 assumed great significance, but in the end it was

⁵ *Cape Times* (Cape Town) 29 September 1985.

⁶ *London Standard*, 31 July 1985.

inadequate and the least favoured options (debt moratorium, controls and a two-tier exchange rate) had to be adopted.

From Rubicon speech to debt freeze

Mr Botha's speech on 15 August was widely promoted beforehand as an announcement of major reforms beginning the dismantling of apartheid, a 'crossing of the Rubicon'. Since a large proportion of short-term foreign credit to the private sector was due for renewal at the end of August it was expected to attempt to offer enough reforms to satisfy those bankers. In the event, it made no real offer of significant political progress, it was strongly criticised by business interests and the discrepancy between the expectation and the outcome precipitated a second phase of the financial crash that had started at the end of July.

The immediate effect of the 'Rubicon' speech was that early the following morning the rand fell by 20 per cent on the Johannesburg foreign exchange. It declined from 45.3 US cents to 38.5 cents before recovering to 42 US cents. Financial interests remained strongly opposed to controls over outflows of money or a debt moratorium, arguing that exchange controls would be ineffective and that if there were restrictions on debt repayments 'this country's credit rating would dive and the capital we need to process the raw materials we produce and sell abroad would dry up.'⁷

Business and finance continued to see some type of reform as the main solution and were strongly critical of the President's failure to deliver even serious promises of any. In a joint statement the two largest business associations, Die Afrikaanse Handelsinstituut and the South African Federated Chamber of Industries expressed regret that 'at this time of crisis, the State President, in addressing the world at large, was not more specific in pointing the nation more positively in the direction of reform and national reconstruction.' The financial newspaper *Business Day* argued in an editorial that if Mr Botha 'cannot perform better than this . . . then we believe the time has come for him to depart.'⁸ Many observers felt that these developments had 'effectively ended the close alliance between government and business forged by Botha soon after he came to power in 1978.'⁹

⁷ *Business Day* (Johannesburg) 17 August 1985.

⁸ *Business Day* (Johannesburg) 16 August 1985.

⁹ *Guardian* (London) 24 August 1985.

In the absence of reforms it became clear that the debt due for renewal at the end of August would not be renewed and in the absence of financial controls this led to a further flight of money out of the rand and into foreign currencies. By 27 August the rand had reached a record low of 34.8 US cents (closing at 35.6). In the third quarter of 1985, a large increase was recorded in dividend payments abroad by foreign-controlled companies repatriating past, undistributed profits, and, after having been reduced in the second quarter, net capital outflows returned to and exceeded the high levels of the first quarter of 1985.

The government was left with no alternative but to take actions which appeared to be panic measures but, upon closer examination seem to have been carefully prepared. On 27 August the authorities suspended all trading on the Johannesburg Stock Exchange and all foreign exchange dealing until 2 September. The next day the Governor of the Reserve Bank flew to London, New York and Washington with no announcement of the purpose of his trip. It was believed that he wanted to obtain the support of the Bank of England and the Federal Reserve Board for special credit facilities, in particular a swap of dollars for gold,¹⁰ although such a swap arrangement could only raise some \$750 million while the short-term debt falling due for renewal was estimated at \$14 billion. No such deal was arranged, nor was the trip successful in persuading commercial bankers to renew credit lines. His mission only served to emphasise the isolation of the South African government if it did not seriously reform apartheid, or, at least, resolve the difficulties that its allies in the US and UK had in supporting it. But the authorities sought to hide this by claiming subsequently that the journey's purpose was only to explain to the UK and US what steps the government and Reserve Bank themselves intended taking.

These emergency steps were announced on 1 September 1985 and consisted of a debt moratorium or temporary freeze and a two-tier exchange rate supported by foreign exchange controls.

Debt freeze and exchange controls

The emergency measures attempted to stem the flight of the two main types of international capital in South Africa, bank loans and money invested in the stock exchange. Bank loans were to be subject to a moratorium or debt freeze. An exodus of investment funds was to be

¹⁰ *Guardian* (London) 24 August 1985.

discouraged by establishing a two-tier exchange rate supported by exchange controls.¹¹

The *debt freeze* halted all repayments of capital on foreign loans for four months (until the end of 1985) but interest payments would continue to be made. The Minister of Finance, Mr du Plessis, said that the relevant interest payments amounted to no more than 6 per cent of the country's annual export earnings and could be met easily.

The debt freeze applied to loans through the banks, suspending repayment of \$14 billion of short-term bank debt. It extended as far as preventing repayments of loans by the foreign branches and subsidiaries of South African banks. This was especially significant because some South African banks, in particular Nedbank, the third largest, had been actively operating in New York and other foreign centres.

It is notable that the debt freeze was focused on bank loans while repayment of other types of loans was unrestricted. These included repayments on maturity of South African public sector bonds quoted on foreign stock exchanges or privately placed notes; debts to international financial agencies; debts guaranteed by foreign governments and their export credit agencies; and the foreign debts of the Reserve Bank including those arising from gold swaps.

The *exchange rate* and *exchange controls* distinguished between current account and capital account foreign exchange transactions. Current account imports and exports of goods and services would occur at a 'commercial rand' exchange rate which the Reserve Bank itself would manage. Sellers of shares or other assets, on the other hand, would only be able to convert the rand proceeds into foreign currencies at the 'financial rand' exchange rate. That rate would be determined by free market forces or, in other words, the outflow of money from the stock market seeking safety abroad (net of any inflow) without the authorities attempting to manage the rate. Controls would be administered to ensure that foreign exchange required for capital export was not acquired at the commercial rate.

The plan was that in the circumstances of 1985 the financial rand would be lower than the commercial rate; the current account surplus combined with Reserve Bank purchases of rands to support their price would make the exchange rate of the commercial rand relatively high while the flight of capital would depress the price of the financial rand. The low financial rand would discourage the flight of capital for it would

¹¹ Speech by Mr B du Plessis, full text in *Business Day*, 2 September 1985.

lower the foreign exchange value of each rand obtained by selling shares. Some believed that by the same token making shares 'cheap in terms of foreign currencies, the measures should encourage a new inflow of capital eventually.'¹²

These foreign exchange measures were a return toward a system of controls and restrictions that had been relaxed only two and a half years earlier. In February 1983 South Africa had abolished exchange controls on transactions by non-residents and ended the distinction between the commercial and financial rand. In previous years, the financial rand had fluctuated at a discount of between 2 per cent and 40 per cent below the commercial rand. They were unified partly as a general move, supported by business and bankers, toward greater 'normalisation' of South Africa's position in the world economy and partly as a result of pressure toward increased market freedom from the IMF which had agreed stand-by credit and other credit up to SDR 1 billion in 1982. The unified rand began at 88 US cents in February 1983 with the Reserve Bank managing the rate, and it was allowed to float in September 1983, falling to well below half its initial value by the time the new restrictions were imposed.

Debt negotiations and attempted stabilisation

When the foreign exchange market reopened on 2 September 1985 the new measures appeared to have halted the panic which had pushed the rand down to around 35 US cents. The exchange rate rose sharply in 'euphoric' trading. But after having climbed to over 41 US cents it crashed back to 37 US cents on Thursday, 5 September. The violent ending of a major strike at Gold Fields of South Africa had undermined the precarious confidence of the markets.¹³ This was a graphic illustration that, of the three types of measure that had been under discussion in financial circles since the July State of Emergency (controls on capital outflow including debt moratorium, two-tier exchange rate and political reform) political stabilisation was the

¹² *Daily Telegraph* (London) 29 August 1985.

¹³ The separation of the financial rand and commercial rand meant that pure capital flight could not cause the latter to crash, but, as in all such arrangements, current account and capital account transactions are not completely separable. 'Leads and lags' are the main way in which current account transactions can disguise short-term capital movements. If, for example, importers expect a fall in the rand (rise in the dollar) they will buy dollars earlier than otherwise while exporters will give longer credit. Such leads and lags were instrumental in the rand's fall at the beginning of September.

fundamental prerequisite for financial stabilisation. It was unlikely that political reforms could bring political stability but Botha's 'Rubicon' speech had not even promised a serious attempt at reform.

The problem of South Africa's foreign debt was even more strongly dominated by political considerations than the stability of the foreign exchange market was. The overseas banks whose assets had been frozen by the debt moratorium were not willing to be seen to negotiate directly with South Africa over repayment of existing debt. Political pressures in the US, such as the decision of several bodies to withdraw funds from banks that lend to South Africa, had precipitated the decision of Chase Manhattan and others not to renew loans falling due at the end of August, and the same pressures prevented them from negotiating a solution with South Africa. Following the discussions Mr de Kock held with the Bank of England, the Federal Reserve, and commercial banks at the end of August, South Africa's debt freeze package included a measure designed to surmount this difficulty. Instead of direct negotiations or the alternative of simply stating its terms to the bankers on a 'take it or leave it' basis, South Africa would appoint an 'independent mediator' to devise a plan for eventually repaying the debt.

The person named to this post was Dr Fritz Leutwiler who in June 1985 had become head of the Swiss industrial multinational, Brown Boveri. His strong credentials for the task stemmed from his record as the former President of Switzerland's central bank and chairman of the Basle-based Bank for International Settlements, an international body which in many respects acts as the central bank to central bankers. Most important was the experience he had gained in Third World debt negotiations. The people with whom Dr Leutwiler had to deal were, on one side, Dr Chris Stals (Director-General of South Africa's Reserve Bank) who chaired South Africa's Standstill Coordinating Committee and, on the other, the representatives of thirty major international banks with loans outstanding. In addition, another 230 banks were smaller creditors and any proposals had to take them into account too.

The mediator's round of discussions (calling them negotiations was abjured) did not produce results within the four-month period of the freeze. The South Africans wanted the banks to accept a long repayment period for outstanding short-term loans, effectively transforming them into medium-term credit. Several leading banks wanted immediate repayment of outstanding debt and no commitment to future loans. Above all, the banks wanted a commitment to political

reforms although these were not specified, a lifting of the State of Emergency and the release of Nelson Mandela were believed to be critical measures of that commitment.

Lack of progress became apparent relatively early. Although it was clear that the lack of new credit facilities from banks as a result of the freeze was causing a severe liquidity squeeze on industry (with importers, unable to obtain their usual 90-day credit, having to pay cash with their orders).¹⁴ On 15 November South Africa let it be known that it expected to extend the debt freeze.¹⁵ The Governor of the Reserve Bank, Dr de Kock, admitted that tangible evidence of political reform was a precondition for debt rescheduling. He 'hinted that this message had finally reached the Government after direct warnings from Dr Fritz Leutwiler' and predicted there would be 'political and constitutional reforms that would go far enough to win the support of moderate opinion, black and white' in South Africa and some African states.¹⁶ Whatever reforms were envisaged their preparation required time and on 10 December 1985 South Africa formally extended the debt freeze until the end of March 1986.

The extension to the freeze was due not only to the time needed to prepare a political package; in addition the two sides seemed to remain a long way apart over the technical, financial details. At that stage, South Africa had put forward proposals for converting the \$14 billion short-term debt due the previous August into medium-term debt. No repayments would begin on it until phased instalments started in 1990 and the repayment date on other debt (which had not yet fallen due) would also be put back several years. As part of its moves to strengthen control over foreign exchange it transferred the frozen loans from the commercial banks to special accounts in the Reserve Bank and it paid interest of only $\frac{1}{4}$ per cent above the international rate (LIBOR) on them.¹⁷ While many of the foreign banks said they wanted immediate repayment, they also wanted a higher interest rate as long as their funds were blocked, and with more general objections too they rejected these proposals.¹⁸

Rubicon II and partial agreement on debt

During the extended debt freeze the State President, opening Parliament on 31 January 1986, did make a major speech in an attempt to meet the requirement for political reforms and it was followed on 20 February by a meeting that appeared to yield some agreement on technical financial terms. But neither of these developments has proved to be enough to settle the debt crisis.

Botha's January 1986 speech contained promises of future reforms which, since they were presented as moves toward the dismantling of apartheid, led to it being called 'Rubicon II', the second attempt at a step that was balked at in August. In fact, the promised reforms were seen as too qualified to be meaningful. Blacks were to be offered an advisory role in legislation through a new 'National Statutory Council', but this would never be accepted by the African National Congress, the United Democratic Front or other anti-apartheid organisations and was thus irrelevant to the demands of the black population. The 'pass laws' or 'influx control' mechanism which had been a cornerstone of apartheid were to be repealed, but they were to be replaced with new legislation to police people's movements through identity cards. The speech promised to release Nelson Mandela, but only on condition that the USSR released Scharansky (which it did soon after, apparently as a result of quite separate negotiations already in progress) and Angola released a South African soldier.

The promises of 'Rubicon II' had been relayed in advance to leading bankers and enabled them to say that they could negotiate a temporary 'informal' rescheduling of the \$14 billion debt frozen the previous August. However, they were insufficient to allow them 'to drop their opposition to a full scale re-scheduling of the country's foreign debt.'¹⁹ In other words, they could not be seen to renegotiate the rest of the outstanding debt (even that which falls due in 1986) or to arrange significant new credits. But the sign of some progress toward regularising the \$14 billion frozen debt was enough to satisfy the markets. Whereas August's 'Rubicon I' was followed by panic on the foreign exchanges, after this speech the rand closed unchanged at 43.8 US cents and within a few days had risen to 45 US cents, and maintained its strength in the following month.

The ability of 'Rubicon II' to provide the bankers with a strong

¹⁹ *Financial Times* (London) 1 February 1986.

enough prospect of reform was, however, soon jeopardised by events. After a few days for analysis, Western commentators assessed that the promised reforms were not fundamental.²⁰ Their weakness was underlined by the rapidity with which Botha criticised his Foreign Minister for saying that apartheid was being dismantled and a black President was foreseeable. It was demonstrated most effectively by the continuing violence, rebellion and repression that marked the country under the State of Emergency. And the political impasse was heightened by the call the ANC and Bishop Tutu made on the bankers to refuse to bail out the government. But despite this the banks and the South African government became sufficiently close on their attitudes toward the debt freeze to enable the mediator to put new proposals to a London meeting of the leading banks on 20 February.

The London talks established a 'broad consensus' between South Africa and those banks (which themselves had advanced some 70 per cent of the country's international bank credit). The plan agreed in broad principle had three key features. First, there would be a further year's extension before repayment of some \$10 billion of frozen short-term debt was required. Thus, the repayment of that amount of debt, originally due in August 1985, would be delayed by at least one year and seven months, and higher interest rates would be paid on it. Second, South Africa would make a down payment of \$0.5 billion starting in April 1986 in respect of the credit it owed. Third, the plan was to be seen as a 'short-term interim solution'; there would be a review of South Africa's economy in Summer 1986 and full-scale discussions in February 1987 with a view to a full restructuring of South Africa's debt.

The Leutwiler plan was agreed in broad principle and a technical committee of twelve banks was established to work out the details.²¹ By the beginning of March, however, it was clear that there was disagreement on the details and there would be difficulties in achieving a full agreement by the end of March deadline. Some leading banks wanted a greater immediate repayment than the \$0.5 billion proposed. Even before the London meeting they had argued that the recent fall in the price of oil and rise in the gold price would double South Africa's

²⁰ A Robinson, 'Botha aims to modernise apartheid, not kill it', *Financial Times* (London) 6 February 1986.

²¹ The technical committee included the following banks: Barclays, National Westminster, Standard Chartered, Credit Suisse Union Bank of Switzerland, Swiss Bank Corporation, Commerzbank, Deutschesbank, Dresdner Bank, Citibank, Manufacturers Hanover and Morgan Guaranty.

surplus on current account in 1986 from the \$1.5 billion Pretoria estimated to almost \$3 billion and this would permit a larger down-payment. Others wanted the Leutwiler plan to be agreed for longer than one year, presumably to delay the necessity of a review and contentious negotiations. Most problematic of all was the fact that unlike most countries' rescheduling agreements, the Leutwiler plan was to be implemented through each bank making an agreement with each debtor on a bilateral basis. This raised the possibility that one creditor may arrange a more advantageous deal than its competitors.

Even if the thirty leading banks could agree a detailed plan overcoming these problems, there was little time available to persuade the other 230 smaller creditor banks to accept the terms before Pretoria's unilateral debt freeze expired at the end of March 1986.

Whether or not an agreement was in place by the end of March it was not any sort of end of the problem; even for the most optimistic bankers it was an interim step. Under white minority rule, South Africa's debt crisis would reappear time and again in future months, for it had been forced into the open by two continuing but opposing forces. international bankers' difficulty in supplying new credit while under pressure from shareholders and depositors, and South Africa's need for foreign credit because of its modern economic integration with the international economy. The debt crisis has become a key and recurring element in the political and diplomatic manoeuvring around a weakened apartheid. In order to judge its future significance it is necessary to consider its present character. The most important questions concerning the crisis that unfolded from Summer 1985 are first, whether the crisis was wholly political rather than also reflecting underlying economy factors, and second, to what extent were the banks' actions determined by political pressure rather than financial considerations. I discuss these questions in the following paragraphs, arguing that, although political factors were important in each respect, more traditional economic and financial considerations had a strong effect. The many commentaries that presented the problem in political terms alone are misleading.

Economic determinants of the crisis

The crash of the rand and of stock exchange prices initiated the crisis in July 1985 and it turned into a debt crisis when banks refused to renew the credit expiring in August. These were both cases of investors

dramatically attempting to switch funds out of South Africa and much emphasis has been placed on their character as responses to political events. The imposition of a State of Emergency, the impact on sentiment of the French government's restrictions, the political pressure on US and UK banks arising from shareholders and from depositors such as New York State withdrawing funds from pension funds and banks with South African business have all played important roles, which, in turn, derived from the fact that the liberation struggle inside the country had reached a new stage. But South Africa's economic problems were growing and, although the country in 1985 was not running balance of payments deficits which made debt servicing impossible (as were Latin American borrowers) the imbalances in the economy predisposed it toward the financial crisis that occurred and, at one level, caused it.

South Africa's economy is dominated by gold-mining and manufacturing. Although other sectors, particularly agriculture, are very large and account for a high percentage of employment, gold and manufacturing are the key sources of profit and the most sensitive links between South Africa and the world economy. Moreover, their fortunes relate directly to urban conditions and organised black labour. In the first half of the 1980s the earlier strength of both these sectors collapsed. The world price of gold dropped from its record of \$850 per ounce to below \$300 at one point in early 1985. The index of the manufacturing sector's output collapsed from 135 at the start of 1982 to 117 during that year (recovering slightly in 1983) as South Africa's exports, despite the low prices achieved through using cheap black labour, were slowed by the world recession. As a consequence of falling gold prices, world recession, and, in the early 1980s, high oil prices, the balance of payments was severely in deficit in 1981, 1982, and 1984. In 1985 the balance of payments current account moved into a substantial surplus following austerity measures taken in August 1984 when the authorities increased bank interest rates from 22 per cent to 25 per cent and imposed controls on hire-purchase and other credit. The severity of the squeeze was indicated by the high cost of credit in real terms, for inflation was then at 12 per cent.

The austerity measures helped the balance of payments but further depressed manufacturing output and increased unemployment. It was estimated that in 1985 black unemployment was approximately three million. From the point of view of stock exchange investors holding shares in manufacturing or foreign creditors having lent to those firms, confidence was shaken by the effect of the squeeze on company profits

and liquidity. This was one of the factors causing an accelerated outflow of capital in the first half of 1985 and it was pushing foreign banks toward refusing to renew their short-term loans even before the political situation worsened.

A related economic factor was that South Africa's international debt had become highly unbalanced and difficult to sustain even under the most neutral financial criteria. Since the beginning of the 1960s the proportion of loans to equity investments had increased sharply and of these loans a high and increasing proportion were short-term bank loans. Thus, whereas the ratio of interest payments to dividend payments abroad was 17 per cent in 1965-9, it had risen to 81 per cent in 1980-83, and at the end of 1984 40 per cent of the interest-bearing foreign debt was short-term. A high proportion of the debt was accounted for by bank debt and, at the end of June 1984, 66 per cent of these liabilities to banks were short term (compared with an estimated ratio of 44 per cent for 'comparable developed countries'). The most telling statistic was the Reserve Bank's estimate that at the end of 1984 short-term debt (with an original maturity of less than one year) was \$14.0 bn while longer-term loans outstanding were \$10.3 bn.

Many Third World countries also borrowed considerable amounts from banks in the late 1970s and early 1980s (which became unsuitable for balance-of-payments reasons) but their predominant form of credit was medium term rather than short term; South Africa was particularly unusual in that its bank borrowings were not contracted by the state (or state guaranteed). The high proportion of short-term debt was mainly incurred in the 1980s by South African banks borrowing dollars on the essentially short-term international inter-bank market, converting them to rand and lending them to local companies. At the end of 1984, private borrowers accounted for about 60 per cent of the foreign debt.²² From the point of view of Western banks, 'lending to South Africa through the inter-bank market provided a near perfect disguise',²³ since transactions on the inter-bank credit markets are never published. But it also meant that South Africa's debt structure was highly unstable and increasingly so; the short term : long term ratio of 14 : 10.3 at the end of 1984 was worse than the 1983 ratio of 12.9 : 11.1.

This debt instability combined with the Reserve Bank's policy toward the foreign exchange market to increase the volatility of the exchange

²² Data from *Economic Monitor*, Old Mutual, July 1985 and South African Reserve Bank, *Quarterly Bulletin*, December 1985, p 66.

²³ *Daily Telegraph* (London) 7 September 1986.

rate. Since 1983, when the rand had been allowed to float, the Reserve Bank had operated a spot-swap technique for buying and selling dollars on the forward market. The fall in rand (by 47 per cent) in 1984 made this policy expensive, and it also made the Reserve Bank seek a new policy in order to support the rand. Thus, in January 1985 it changed the operation of the forward market by also carrying out outright purchases and sales at different rates from the spot-swap rates. This new system, however, created many problems, one of which was that it could increase the instability of the spot rate by increasing the Reserve Bank's spot purchases of dollars at crucial times to meet its forward obligations.²⁴ When the foreign exchange panic broke in mid-1985 this was an additional source of instability; from a longer-term point of view the unsatisfactory nature of the techniques adopted under a system of floating exchange rates comprised a strong economic pressure toward adopting a two-tier exchange rate with a managed commercial rate.

Bank prudence and financial criteria

Although the economic developments I have outlined have interacted with political events it is commonplace to see the debt crisis as essentially political. This broad judgement is open to several interpretations. One is that the international banks, subject to political pressure from depositors and shareholders, and, perhaps, wanting to establish their good standing with a future ANC government in South Africa, have taken an essentially political stance. On this view the banks have cut their loans in order to speed apartheid's end, and statements by bankers themselves have supported this interpretation.

In announcing Barclays' results for 1985, the group's chairman 'said the bank wanted to see "changes which confirm an end to the bankrupt policy of institutionalised racial discrimination" . . . [and] added that one of the requirements it would consider a sign of good faith from the republic would be the release of the imprisoned black leader, Nelson Mandela.'²⁵ In an earlier report the *Guardian* (London) had quoted 'a considerable consensus' among British bankers and business leaders typified by the statement that 'Political rights for Africans are now on

²⁴ R M Gidlow, 'Forward exchange policy in South Africa', *South African Journal of Economics* 53(3) September 1985. It was reported that with the falling rand, the spot-swap system had cost the Reserve Bank R 2 billion losses in the year to March 1985, *Star* (Johannesburg) 22 August 1985.

²⁵ *Guardian* (London) 7 March 1986.

he agenda. In the past you could have talked about social rights or human rights alone. That is no longer enough.'²⁶ In fact, though, this view is misleading. The banks' behaviour has been consistent with the pursuit of their normal financial criteria rather than political objectives.

Banks as institutions have not seen it as their business to push for political reforms for reform's own sake. In following financial criteria bankers have had two immediate objectives: first, to protect their own assets; second, to safeguard the delicate mechanisms of the international financial system. In order to do this the banks have cooperated with Pretoria, and South Africa has cooperated with them while maintaining their different perspectives on political reform. This had led to a view that the banks' statements on reform are empty. At the time of the 20 February meeting, Bishop Huddleston, president of Britain's Anti-Apartheid Movement said agreement showed that 'the banks have decided to come to South Africa's rescue . . . [in] a political act. . . . Dr Leutwiler is little more than a mouth-piece for Botha', and Neil Kinnock, Leader of the Opposition, argued that a 'decision to allow South Africa to postpone repayments would be of great assistance and encouragement to President Botha.'²⁷

The first financial criterion, of protecting their own assets, was easily executed by the banks and other financial institutions. The deterioration in the economy, the distorted debt structure and increased political instability led them to reassess the riskiness of their investments according to the criteria, well established since the early 1970s, of political risk analysis. When the State of Emergency was declared, it was reported that 'Frost Sullivan, the New York political risk consultancy, has dropped South Africa from ranking as one of the safest of the world economies to "a par with some of the higher risk Third World countries"'.²⁸ Following normal criteria, banks and investors responded by withdrawing funds and refusing to renew credits. At a more general level their concern for reform was an attempt to protect assets by achieving stabilisation of South African society, but I shall argue below that such hopes were misplaced.

The second financial criterion, protecting the delicate mechanisms of the international financial system, was particularly relevant for Dr Leutwiler, the Bank of England, Federal Reserve and other central

banks, but it also affected the creditor banks themselves. At its heart was the problem of ensuring that the inter-bank credit market was not permanently damaged. And more widely its aim was to ensure that despite the debt crisis, South Africa's large economy with its control over gold production was not cut off from the Western world's financial system.

The inter-bank market for credit is both crucial for the international financial system and usually regarded as delicate and easily disrupted. It links all major banks across the world enabling them to lend funds which are temporarily in surplus to other banks at a profit. It is informal and enables banks to borrow very large sums from other banks for short periods varying from overnight loans up to one year loans. Its survival depends on all borrowers servicing their huge debts and upon lenders not panicking and withdrawing their liquid loans.²⁹ South Africa's short-term bank debt consisted to a large extent of such inter-bank credits and they were a threat to the whole system because, instead of being made on the usual rotating basis to balance the surpluses and deficits different banks have in their liquid resources, these were contracted as an indirect means of providing core finance to companies. Ultimately, they became a real problem for the inter-bank market because South Africa froze repayments, and this was a unique shock.

In 1982 it became apparent that Brazil and other Latin American countries had also used the inter-bank market to obtain core finance; in those cases to provide the state, through the banks, with finance to cover the balance of payments deficit. When Mexico virtually defaulted on its other debts in 1982 the inter-bank market suffered a severe shock as bankers themselves withdrew their money from the vast loans to banks such as Brazil's. In South Africa in 1985 the bankers did not actually withdraw funds but the shock to the market came from the state freezing repayments. Neither Dr Leutwiler nor the banks knew whether this new type of disruption would critically damage the inter-bank market; their task was to minimise such damage. Although many countries had agreed debt reschedulings with their bankers in recent years, inter-bank credits were generally excluded from these arrangements. When South Africa's leading bank creditors agreed in principle to the Leutwiler package, bank technicians saw this as the first major rescheduling of inter-bank debt and it appeared that the

²⁹ J Coakley and L Harris, *The City of Capital*, Oxford: Basil Blackwell, 1983, pp 66-7.

negotiations had succeeded in ensuring that the world's inter-bank market could continue to function smoothly.

To avoid totally disrupting the inter-bank market it was necessary for rescheduling to be achieved in a manner which 'normalised' the positions of both borrowers and lenders. Each needed to reach a solution which offered a realistic prospect of predictable repayments of capital and payments of interest. For the banks an additional requirement was that the liquidity of their outstanding debt should be restored as far as possible (for the inter-bank market's value has been the liquidity it offers lenders). That problem was not solved at the February meeting although the possibility of converting the outstanding debt into certificates which could be bought and sold between banks was discussed and viewed favourably in that context. But both Pretoria and the banks had a mutual interest in achieving a realistic agreement on a predictable payments schedule.

An illustration of the common interest of central bankers in South Africa and other countries in ensuring that the debt issue did not put the international financial system at risk was the restraints placed on Nedbank's New York operations. This bank had taken the lead in establishing its own business abroad, borrowing actively through its New York office. There were concerns about this activity in any case, but after the debt freeze they became acute. The American authorities were concerned about the bank's ability to meet its commitments and possible repercussions on the stability of the money markets. Sharing this concern for the system the South African authorities acted to secure Nedbank's US business and management changes followed. Pretoria and leading bankers also shared a desire to ensure that South Africa was not cut off from all sources of new credit. Mr du Plessis' announcement of the debt freeze in 1985 was careful to leave several areas of international finance where 'business as normal' would be the order of the day. By excluding from the moratorium state debt and finance obtained under export guarantee schemes, Pretoria left a window through which foreign credit could be obtained in future. The leaders of the international financial system share that interest in maintaining normal provision of credit and avoiding the isolation of the country, for cutting off all its sources of finance would disrupt all the economic relations it has with the UK, US and Europe. It is not yet possible to assess the extent to which new lending continued after the debt freeze. There were net repayments of these credits according to the Reserve Bank, but they were not large and the inflows within the total are not

known. As well as reports that some firms have had difficulty in arranging trade finance, newspapers have reported that new credits have been arranged both for industry and for bodies such as the Urban Foundation which are presented as politically liberal institutions.

Assessment and prospects

Although South Africa's debt crisis is often seen in wholly political terms it arose from the interplay of political and economic developments. Its future course, too, will depend on the same factors although the more acute South Africa's political crisis becomes the more politics affects financial matters. The other side of the coin is that the debt crisis has had a significant effect on South Africa's politics, hastening the break-up of the ruling bloc's consensus, heightening the conflicts of interest within white society, and injecting a new destabilising factors into South Africa's diplomatic relations with the Western powers.

To reach an assessment of the debt issue we have to judge the way in which economics and politics affect it and are affected by it. Doing so leads to the conclusion that the regime's debt problems will have a continuing importance and be a recurring flashpoint. It would be a mistake to see negotiations such as those under Dr Leutwiler as being aimed at achieving a 'settlement'. There is no sense in which a rescheduling or restructuring can be achieved which would put the apartheid economy's external debt onto a new and sustainable footing. Instead, any agreement can only be seen as a temporary and fragile intermission; although finance is a mundanely materialist issue, bankers' agreements on it are best seen as stations of the cross for apartheid.

The unattainable character of a long-term solution results from several factors. First, instead of the principal actors—the South African regime and the banks—having well defined strategies and positions which can be the subject of negotiations, each has a strategy and interests with many contradictions and divergent interests within it. Second, the underlying political and economic factors which generated the crisis are likely to intensify. Third, and most significant, the growth of the people's rebellion and the strategic strength of the African National Congress and its military wing, *Umkhonto we Sizwe*, which have been instrumental in heightening the conflicts of interest and the political and economic crisis, will continue to determine the conditions

within which debt is located. In the following paragraphs I discuss the insoluble contradictions in the positions of the banks and the government and consider the relation between debt and the fight against apartheid. As background, I assume that the recession experienced by the South African economy in the first half of the 1980s is a mark of structural economic problems which will continue with high unemployment and reduced profitability. This may be ameliorated temporarily, as it has been in the first quarter of 1986 by international markets' reductions in the price of oil or increases in gold prices, but the structural problems remain³⁰ and are intensified by the political instability.

The banks lack a clear strategy because, at one level, they want to regularise relations with South Africa and, at another, to pull out. In the long term, even if less profitable than previously, the South African economy is such a key element of the West's international economy that banks have a strong interest in regularising its financial position. This finds expression particularly in the central banks of the US, UK and continental Europe, and among the strategically minded policymakers of the major international banks. This tendency produced the bankers' agreement to the broad principles of the Leutwiler plan justifying the anti-apartheid movement's criticism that the bankers were supporting Botha, but it is caught up in a number of contradictory forces. Bank shareholders and the supervisory agencies do not favour exposure to an economy which is now judged to be a high credit risk; this affects all banks but is especially important for the 230 or so medium and small banks who are creditors. Some banks are subject to considerable pressure from shareholders and depositors with anti-apartheid concerns. Because of such pressure, lending in the 1980s has been disproportionately to the private sector rather than the South African state, with an exceptionally high proportion being short-term credit through the inter-bank market and for technical reasons this cannot easily be rescheduled on a long-term basis. The inter-bank market's essential characteristics are its informality, liquidity and its short-term loans, but a rescheduling agreement, by its nature, goes against them. It could only exist either as a temporary patching up for want of anything better (an approach that appears to have predominated in February) or, as a longer-term basis, if there were substantial and unlikely financial innovations such as the creation of a secondary market in South African short-term debt.

³⁰ See J Natrass and Innes Gelb.

Financial markets' judgements on any economy are based on simple indicators; for example, at any one time the money supply, the current account balance, the public sector deficit are treated as key indicators. In this case 'political reforms' have been identified as a crucial measure of creditworthiness. Banks have seen progress on reforms as the one thing that would enable some reconciliation of their desire to regularise South Africa's international finance and their need to reduce the risk of lending to the country. But, in fact, that path toward solving financial problems is not very promising for the banks. One difficulty is that the banks themselves cannot specify a list of political reforms by which they can measure progress. It is indicative that before the 20 February meeting in London there was speculation that the banks would consider a document with a political preamble on desirable reforms, but they refused. Similarly, Barclay's chairman, in announcing his group's results and their intention to pull out from South African business, refused to detail desired political reforms apart from the release of Nelson Mandela.³¹ Although that demand is a remarkable advance in itself, it has become for many bankers (and politicians) a symbolic demand which substitutes for the detailed political reforms they rightly feel they could not specify. Another difficulty (the main difficulty) with the banks looking for political reforms is that reforms in themselves cannot guarantee the type of political and economic stability sought by the financial community. Indeed, substantial political and social reforms are as likely to open the way to an intensification of the popular struggle against apartheid. On that perspective, social and economic instability is inescapable until majority rule is achieved and reconstruction under an ANC government is under way, so that political reforms themselves could not solve the debt crisis.

If the banks lack a clear strategy, the South African government's own position on the debt is even more problematic. For them the debt issue is one aspect of their attempt to maintain apartheid in one form or another. Thus, 'what to do about the debt' is inseparable from the questions of what to do on the diplomatic front abroad and political, social and economic reform at home, and the Nationalist government is no longer able to have a clear, unified strategy on those questions.

In the face of each side's complexities and constraints, the manner in which the 1985 debt crisis was handled was the most favourable possible for the South African regime, and it offered great advantages to the

³¹ *Guardian* (London) 7 March 1986.

banks. Although the package was not completely tied up at the February meeting, the agreement on broad principles effectively meant that the major banks had agreed to reschedule South Africa's short-term debt for at least one year (or more than one year after their due date). Since inter-bank debt is not usually rescheduled this was a considerable achievement for South Africa, giving the regime considerable support. At the same time, the banks gained much to satisfy that element that sought to normalise South Africa's financial relations. Because South Africa appeared to declare the debt freeze unilaterally the banks were able to achieve this while presenting themselves to depositors and shareholders as wishing to pull out of South Africa and being forced into rescheduling against their will. This was reinforced by the Reserve Bank's deliberately unrealistic December proposals for a four to five year rescheduling and the banks' inevitable rejection of it in favour of more modest arrangements. And, as with any rescheduling, the banks gained increased interest rates.

This was not the only way in which the foreign banks could have reacted to the debt freeze, for another direction which the conflicting tendencies in their strategies could have taken would be to veer toward recovering their assets by pulling out rather than staying in. This did happen to some extent after the debt freeze. The Reserve Bank's *Quarterly Bulletin* for December 1985 reported that 'After the introduction of the [September] standstill arrangement, large repayments were made on loans exempted from the "standstill"'.³² But since the country's gold and foreign exchange reserves fell by only R1.5 billion in the third quarter of 1985 and much of this was accounted for by leads and lags on the current account, the net withdrawal of credit cannot have been on a large scale. In any case, net repayment of exempted loans was not the heart of the matter, the strongest action to recover the debt would have been to react to the debt freeze by freezing the assets of South Africa abroad. This strategy was proposed by three leading clergymen, Bishop Tutu, Dr Naude and Dr Boesak. They wrote to Dr Leutwiler on 8 February 1986, proposing 'that the banks should immediately freeze all South African bank balances in their books and refuse to effect any transfer instructions over these accounts' and suggesting 'that the banks should obtain court attachment of aircraft, ships and other SA assets and apply the proceeds against South African indebtedness.' It was reported that by 20 February they had not

³² South African Reserve Bank, *Quarterly Bulletin*, December 1985, p 12.

received a reply.³³ Such assets freezes have been applied elsewhere by foreign governments (most notably the US against Iran, and by the UK against Argentina). And they could have covered the debt since South Africa's total foreign assets (not including the ships and aircraft mentioned by the clerics) were some \$12.4 billion at the end of 1984.³⁴ The fact that such actions appear not to have been considered is a measure of how far the contradictions in the banks' position were weighted in favour of maintaining relations with the regime.

Nevertheless, in the months following the debt freeze, South Africa has made policy pronouncements which attempt to give an appearance of reform. The question is whether, or to what extent, foreign creditors' opinion was responsible for promoting an apparent change of heart and that requires an examination of how significant any changes have been and what their background is.

The most publicised policy statements have been Botha's address on opening the new session of Parliament on 31 January 1986, and the announcement in March that the State of Emergency was being lifted. The address promised an end to the pass laws and minor constitutional reforms; but the first is a promise of cosmetic changes since the pass laws were to be replaced by other forms of control, and the second proposal a new body which could only be rejected by the ANC. In effect, those items could not be treated as promises of reform. It also announced proposed changes in the education system. These did suggest some movement, building on the 1981 De Lange Report and the 1983 White Paper and going further than the reforms introduced in an Act of 1984. Their announcement was clearly aimed at influencing foreign creditors, but it would be mistaken to conclude that the proposed reforms were basically due to the pressure over debt; in essence they were a response to the school-pupils' rebellion.³⁵ Similarly, the lifting of the State of Emergency in March was a response to several political forces so that the debt crisis can only be seen as a small element within the whole. It was lifted because the riots and military actions had shown that it was ineffective in repressing the movement, because the 'normal' security laws give the State enormous powers, and because it alienated a range of potential allies in the business establishment and abroad (of which the bankers were only one element).

³³ *Daily Dispatch* (East London) 20 February 1986.

³⁴ South African Reserve Bank, *Quarterly Bulletin*, December 1985, p 66.

³⁵ E Unterhalter 'Seeking social stability: political responses to the De Lange Commission Report', unpublished paper, 1986.

By March 1986 the economic, political and social system of South Africa was in such turmoil and the diplomatic structure of support for apartheid so undermined that even Chester Crocker, the architect of the system of 'constructive engagement' under which the US had supported South Africa, called the insurgents 'freedom fighters'. In the context of such shifts, bankers' opinion have had only a secondary role.

Nevertheless, the debt problem will resurface. The short-term debt due in August 1985 is being rescheduled for one year with a full review before further arrangements are agreed. South Africa's medium-term foreign debt, estimated at \$10 billion in 1985, will fall due for renewal; between March 1986 and March 1987 \$1.5 billion of it is due for repayment plus \$500 million down-payment on the frozen short-term debt. And unless new arrangements are made on old debts, a flexible profitable economy requires new credits especially if the restructuring set in train by the recession and social changes is to move ahead. When debt is on the agenda it is clear that further pressure from anti-apartheid forces and solidarity movements will attempt to ensure that the South African regime is effectively isolated financially and that financial difficulties become effective financial sanctions.

JAMES PAINTER

Guatemala in civilian garb

On 14 January 1986 Vinicio Cerezo of the Partido Demócrata Cristiana Guatemalteca (DCG) took office as Guatemala's first civilian President for sixteen years, and only the second since 1954. Guatemala became the last of the three Central American countries forming the *triángulo del norte* (Honduras, El Salvador and Guatemala) in which the military have handed over formal tenure of office—but not power—to civilian rulers. A pattern had already become familiar from the Presidential elections in Honduras (November 1981) and El Salvador (March 1984), in which military or military-dominated governments were replaced by civilian 'centre' or 'centre-right' presidents, largely in order to comply with Washington's strategic requirements in the region.¹ According to the model, the new civilian regimes became 'democratic' allies of the United States, but in reality were given few powers independent of the US or the army. Although the military presence in public administration was reduced, the army retained strict control over security matters and maintained or expanded its main political *raison d'être* of defending the rigid socio-economic status quo against either the threat of popular opposition (in the case of Honduras) or already-existing strong revolutionary forces (in the case of El Salvador).

Guatemala broadly fits the general pattern in terms of the division of power and roles between civilians and the military but the political dynamic leading to the return to civilian rule was distinct from that of its neighbours. The 'external push' from Washington to hold elections was not as significant as the Guatemalan army's own perception of the need for a partial withdrawal in order to maintain the present political balance of power. This in itself is not surprising, as Washington's leverage over the Guatemalan army has been severely limited since 1977, when President Carter's human rights policy led to a fiercely nationalist right-wing backlash from many senior officers. This article

¹ For the return to civilian rule in Honduras see Latin America Bureau, *Honduras: State for Sale*, London 1985, pp 74–102, and for Duarte's victory in El Salvador, see James Dunkerley, *The Long War: Dictatorship and Revolution in El Salvador*, London: Verso; 1985, pp 233–48. Comparisons with the democratisation of the Southern Cone are not very useful: the Guatemalan elections form part of a counter-insurgency plan for a civil war that is still continuing (although at a low level of intensity); in general, the Guatemalan army have dictated the pace and terms of the return to civilian rule; and they will retain much more political power than their counterparts in Uruguay, Brazil or Argentina.

therefore focuses on the two major internal dimensions which have dictated the rationale for Guatemala's electoral process, both of which have to be placed broadly within the counter-insurgency strategy of an army which has been waging a 25-year war against the region's oldest and most resilient guerrilla movement.

First, ever since the March 1982 coup of General Ríos Montt the return to civilian rule was seen as an integral part of the army's security plan. One strong current of army thinking had always recognised the political advantages of reimposing constitutional rule (albeit in a different format to the model of the 1970s); externally this would salvage the reputation of a country regarded as one of the continent's worst (if not the worst) human rights violators, and internally it would go some way towards reconciling tensions with the tolerated political parties and reducing the legitimacy of the guerrilla forces. By 1985, the army was sufficiently confident of its political and military control over former and present areas of conflict to allow a civilian to take over the formal trappings of office, but not to permit a decisive change in its authority over security issues. Once it had become clear that none of the main parties was advocating either prosecutions for past human rights violations or reforms that would seriously threaten the landed oligarchy and the commercial and industrial sectors who have traditionally held political power, the acceptability of a civilian President was put beyond doubt. Secondly, the elections came as a much-needed palliative to what has plausibly been described as Guatemala's worst economic crisis for fifty years. A democratically elected administration was seen by the army as a necessary condition for new and expanded flows of foreign investment and bilateral and multilateral economic aid, which were regarded as the best way out of the economic decline and the increasing social polarisation, which, if it were not at least halted, could only benefit the left in the long term.

This article also briefly examines the reconstruction of the Guatemalan 'centre', the significance of the victory of the Christian Democrats, and the political spaces open to, and restraints on, the new government. Despite the ubiquitous optimism generated by Cerezo's victory (an optimism shared by the US State Department and Fidel Castro), it is hard not to conclude that the elections will once again fulfil their historical role of legitimising the status quo and will not act as a promoter of social reform.

Counter-insurgency and the search for legitimacy, 1982-5

The principal long-term effect of the CIA-engineered counter-revolution that toppled the reformist regime of Colonel Jacobo Arbenz in 1954 was to turn the Guatemalan military into the country's most powerful political force and the ultimate guarantor of a rigid socio-economic system that had been temporarily threatened by the Arbenz government. Since 1961 a counter-insurgency war has been the single most important historical determinant of the army's political role. Throughout the late 1960s, 1970s and 1980s the army had dominated successive regimes, either to pre-empt, or to deal directly with, a guerrilla or popular challenge. From 1966-70 the chosen method was to withdraw from direct rule to allow the civilian Presidency of Méndez Montenegro, but only after a pact had been signed giving complete independence to the army in its war with the Fuerzas Armadas Rebeldes (FAR) in the eastern departments. In the 1970s the method changed to the establishment of a system of closely managed 'elections', in which the former Minister of Defence would take over the Presidency from his predecessor as the candidate of an alliance between traditional right-wing and army-created parties. The general elections of 1974, 1978 and 1982 became elections for generals as the army candidate was declared the winner in the face of clear evidence of extensive fraud and mounting abstention (which rose from 46 per cent of registered voters in 1970 to 65 per cent in 1982, despite the fact that voting was compulsory).²

The model broke down on 23 March 1982 when for the first time in nineteen years sections of the military resorted to a coup to maintain power. Although the new regime under Ríos Montt immediately pledged to clean up both the electoral process and the unprecedented levels of corruption and financial mismanagement reached by the outgoing Lucas García administration, it soon became apparent that the main reason for the coup had been the high command's conduct of the civil war. In the western highland departments large numbers of Indians had become either active or passive sympathisers of the EGP (Ejército Guerrillero de los Pobres) and ORPA (Organización del Pueblo en Armas), largely as a reaction to the army's repression of their attempts to form cooperatives and other grass-roots organisations as a way out of

² A useful overview of the electoral process in Guatemala can be found in *Polemica, Elecciones en Centroamerica*, March-June 1984, pp 34-55.

their increasing impoverishment.³ By the middle of 1981 the EGP had at least four fronts in the departments of El Quiché, Huehuetenango, the Verapaces, and Chimaltenango, parts of which were described by observers as ranging from 'on the verge of insurrection' to 'no-go' areas for the army. ORPA too had stepped up its operations in San Marcos, Sololá and Quezaltenango, while the FAR had a significant presence in Chimaltenango and El Petén. By the end of 1981 there was insurgent activity in sixteen of Guatemala's twenty-two departments, and guerrilla strength had reached its peak of operational capacity. When the EGP, ORPA, and the FAR signed a unity pact together with one faction of the Communist Party (PGT-Nucleo) to form the Unidad Revolucionaria Nacional Guatemalteca (URNG) in January 1982, this was widely interpreted as an accurate indication of the seriousness of the guerrilla threat. Both the right-wing parties and large sections of the army thought that the war was in danger of being lost.⁴

What ensued was a seventeen-month period of direct military rule under Ríos Montt, which decisively shifted the balance of the war in the military's favour. This was in part due to the temporary marginalisation of those members of the high command who were more interested in the spoils of office than in winning the war, and the greater decentralisation of power towards those middle-ranking officers who were actually doing the fighting. But the real significance of the coup lay in the endorsement and implementation of an emergency counter-insurgency master plan, named the National Plan of Security and Development. This was approved by Ríos Montt on 1 April 1982, although the principles of the plan had already begun to be implemented in the latter half of 1981 under the command of Benedicto Lucas, the brother of Lucas García. For the first time a major impetus was given to the incorporation of broader economic, political and ideological perspectives into the

³ The literature on the rise of the guerrilla forces includes George Black, *Garrison Guatemala*, London: Zed, 1984, ch. 4; J Fried *et al.*, *Guatemala in Rebellion: Unfinished History*, New York: Grove Press, 1983, Part III, and Part IV, ch. 2; Concerned Guatemalan scholars, *Dare to Struggle, Dare to Win*, New York 1981. ⁴ There is considerable debate as to whether this was in fact the case. The URNG's public position is that they overestimated their own strength, while gravely underestimating that of the army and government intelligence network. The triumphalism following the Sandinista victory in Nicaragua was one factor that clearly affected their strategy and expectations. There is less debate about the army's perception of the threat. General Lobos Zamora, Chief of Staff under the Mejía government, in a speech in October 1984 estimated that the EGP alone had gained up to 260,000 'ideological sympathisers'.

counter-insurgency model. At the local level, this meant moving away from purely military responses towards addressing the basic socio-economic and political conditions that allowed the guerrillas to gain popular support. At the national level it stressed the importance of a return to constitutional rule. Points 12 and 14 of the Plan spoke explicitly of the need both to 'restructure the electoral system so that . . . there will be respect for political participation and avoidance of frustration among the people' and 'to re-establish constitutional rule in the country as a matter of urgency'.⁵ It amounted to a recognition by the new command of the benefits of a two-track policy of conducting a more 'efficient' counter-insurgency war and linking it to a return to constitutional rule, which was clearly regarded as a security issue.

The National Plan heralded one of the most savage periods of Guatemalan history. The first stage, named 'Plan Victoria '82', entailed a major escalation in military pacification campaigns against the guerrilla's civilian support base and a broadening of a civic action scheme known as '*Fusiles y Frijoles*' ('Bullets and Beans'). The scheme's principal objective was to secure permanent access to whole Indian communities by compulsory mass involvement in rural security and development programmes. The devastating effect of the purely military side to the campaign has been widely documented.⁶ 'Scorched earth' tactics and a highly calculated pattern of mass murders became commonplace. Amnesty International estimated that 2,600 civilians, mostly Indians, were killed in the first six months of Ríos Montt's regime, while other human rights organisations put the year-end figure as high as 10,000. The creation of a network of civilian defence patrols, whose membership had already reached 40,000 by September, was politically just as important. Ríos Montt succeeded in winning the military's support for the civilian patrol system largely because the programme was designed to separate the Indian civilian population from the guerrillas without creating an independent militia force (which the army feared could be used against them). Military control over the civilian patrols was only assured by a mixture of terror tactics and the linking of food handouts to cooperation with the government.⁷

Ríos Montt was slow to comply with the return to constitutional rule. The creation of an advisory 34-member Council of State drawn from a wide variety of interest groups was heralded by his apologists (including the US State Department) as evidence of his democratic credentials, but in reality it consisted of token representation and was boycotted by all the major parties. Exactly one year after the coup (and in response to at least four more coup attempts), Ríos Montt announced a 'political opening', and decreed the Political Parties Law and the Voter Registration Law and set up the Supreme Electoral Tribunal. Three months later, under pressure both from the political parties and sectors of the military, elections for a Constituent Assembly were set for 1 July 1984.

Ríos Montt was finally ousted on 8 August 1983, and was replaced by his former Minister of Defence, General Mejía Victores. The coup was not due to his lack of haste in returning government to civilians. Rather, he had alienated the business community by proposing a value-added tax; he had angered the upper echelons of the army by relying on an inner circle of junior officers and interfering with the traditional patterns of army promotion; the Catholic church hierarchy were dismayed by his aggressive style of 'born-again' Christianity; and his reluctance to support US regional plans for the reactivation of CONDECA (the Central American Defence Council) had distanced him from the Reagan Administration. However, from the beginning, the Mejía government pledged its support for a two-stage electoral timetable of withdrawal. Both stages were firmly placed within the army's annual counter-insurgency plans for 1984 and 1985, the successors to Ríos Montt's 'Victoria '82'. 'Reencuentro Institucional '84' ('Institutional Renewal '84') included an expansion of counter-insurgency operations, but also the holding of Constituent Assembly elections as scheduled, while 'Estabilidad '85' ('Stability '85') called for Presidential elections in 1985. The majority of senior officers clearly believed that the pseudo-democratic channels which had functioned in the 1970s should be reopened and the tolerated political parties be given space within them. What had changed was that they would not allow themselves to compete openly nor offer obvious support for any one candidate.

The first stage took place on 1 July 1984, when elections were held for a Constituent Assembly. The parties taking part spanned only the far-to centre-right of the political spectrum. Owing to the peculiarity of the electoral system, the DCG won the highest percentage of the vote

(15.6 per cent) but only twenty of the eighty-eight Congress seats as against the twenty-three won by the far-right MLN-C alliance (Movimiento de Liberación Nacional—Central Auténtico Nacionalista) and the twenty-one won by the centre-right UCN (Unión del Centro Nacional). The remaining twenty-four seats were shared by five other parties and one civic committee. The military did gain some internal and international acclaim both for allowing the elections to go ahead and for the large percentage (78 per cent) of the registered electorate who had voted; but many commentators pointed out not only the electorate's more likely reasons for voting, but also the 460,000 blank or spoiled papers which, at 23 per cent of the vote, would have constituted a victory in the elections.⁸ The Constituent Assembly was clearly designed as a cosmetic exercise. It was only empowered to draft a new Constitution and set the timetable for Presidential election in 1985, and it could not enact legislation or elect an interim President. By December 1984 only thirteen articles of the new Constitution's chapter on individual rights had been approved. The full Magna Carta was passed on 31 May 1985, setting the first round of Presidential election for 3 November and the (possible) second round for 8 December.

The consolidation of army control in the rural areas

In the three-year period after Ríos Montt's 'Victoria '82' the army was able to consolidate its political control over former conflict areas. This essentially low-cost strategy, to a large extent not aided by huge amounts of aid from the US, proved highly effective in addressing the 'development' aspect to the security plan.¹⁰ The sheer scale

⁸ Everyone over the age of 18 (except for illiterate women) was required to vote or face a fine of 50 quetzales. The failure to receive a registration stamp on an identity card often gave rise to suspicion and created legal problems (like the denial of a passport). See Inforpress Centroamérica, *Guatemala: Elections 1985*, Guatemala City, October 1985, pp 25–6.

⁹ Mejía Victores had made this explicit one week before the elections: 'The Assembly does not have the authority to elect a provisional President, and the elected deputies . . . cannot pass substantive measures. We must be very clear: The people are not granting authority to the Constituent Assembly.' Quoted in *Le Monde Diplomatique*, Mexico City, January 1986.

¹⁰ Between 1977 and 1984, the Guatemalan military received no direct bilateral military aid from the US; in 1985 US \$300,000 was granted for military training, and US \$10.3 million was projected for the fiscal year 1986. However, trucks, jeeps and helicopters worth more than US \$30 million were sold to the Guatemalan army by US companies over the same period. USAID indirectly contributed several million dollars to the army through its grants to the National Reconstruction Committee and BANDESA, the rural development bank. Military aid support from Israel, Taiwan, South Africa and pre-Alfonso Argentina largely replaced US assistance.

evastation and terror left by the initial stages of 'Plan Victoria' greatly facilitated the process.¹¹ 'Firmeza '83' ('Stability '83') marked the decisive shift of emphasis from purely physical repression (which still continued) towards creating the necessary instruments of social control and restructuring of the rural economy for counter-insurgency purposes. The civilian patrol system remained the linchpin of the strategy and was expanded to 900,000 members, but six 'development poles' and around fifty model villages were also added.¹²

In 1983 the programme included the army's expansion and internal restructuring, and a decentralisation of the state's administrative functions. Total troop strength grew to 40,000. The army's old office of military/civilian affairs (S-5) was upgraded to run the model villages, development poles and civilian patrols. In October the army also announced the formation of a system of Inter-institutional Coordinators (ICs), which were in effect a form of parallel government in the rural areas. They were organised on a national, departmental and local level such that all government and private (both national and international) development projects and resource allocations were subordinated to army authority and therefore to national security goals. The IICs involved the incorporation of up to twenty state or parastatal agencies, many of which were brought under military control. At the national level, the IICs were headed by the Army Chief of Staff, at a departmental level by the regional commander, and at the municipal level by a local mayor, who was supervised by the local military commander. The civilian patrols, development poles and the IICs (although in a slightly different format) were all legally written into the new Constitution. As one expert on Guatemala recently observed:

The army has saturated the Guatemalan countryside with barracks and bases, regular troops and paramilitary patrols, resettlement camps and model villages. It has created a complex fabric of new agencies, programs and bureaucratic structures, and begun to address new ways of organizing the rural economy . . . the army may be going back to the barracks, but in its definition the barracks cover most of Guatemala.¹³

¹¹ Based on government figures for the number of orphans in the highland departments, the Washington Office on Latin America in their 1985 report *Without Security or Development: Guatemala Militarised*, put the death toll for the period 1981 to 1984 at between 50,000 and 75,000 dead or disappeared; according to the army 440 Indian villages had been destroyed; there are between 100,000 and 150,000 Guatemalan refugees in Mexico; and around half a million Guatemalans are internally displaced.

¹³ 'Under the Gun', *Nacla Report on the Americas* 19(6) November-December 1985, pp 21-2.

The whole system allowed the army to retain its control over resources and the rural population, even under a future civil government. Frequent statements made by regional command throughout 1985 made it clear that the new civilian President would meet enormous obstacles in trying to dismantle such a deeply implanted system.¹⁴ This was not just because the army would be reluctant to give five years of counter-insurgency work pass out of their control. Although the overall effect of counter-insurgency plans from 1980 had been to deal a severe blow to the URNG (and especially the EG), there were signs throughout 1985 that guerrillas were recovering some lost ground in terms of the number of actions, arms recuperations, and army casualties. In the first ten months of the year, 210 guerrilla actions were reported, a 40 per cent increase from the same period in 1984, and more than the total for 1983. In the months of September and October URNG actions were reported to have reached their highest level in three years, affecting eleven of the twenty-two departments. Although none of the URNG's military actions demonstrated a capability to move from small-scale ambushes and outpost raids to a more sustained engagement with the army, their constant presence in rural areas, including regions under tight military control, strengthened the military's desire to keep intact the various elements of its counter-insurgency programme. Even so, the army's overall confidence in its level of control over former conflict zones was a central factor in allowing a civilian to take over. They could accept a tactical withdrawal from formal power once the necessary measures had been passed to guarantee the consolidation of its counter-insurgency policy. They knew that one advantage of a civilian administration would be to increase the chances of the US Congress allowing more military aid from the Reagan Administration; but this was seldom considered as important as the need for increased flows of economic aid, both for its own counter-insurgency purposes and for the economy as a whole.

¹⁴ See, for example, *Inforpress Centroamericana*, *ibid.*, p 35; and *Wall Street Journal* (New York) 31 October 1985.

¹⁵ *Inforpress Centroamericana*, Guatemala City, No. 671. The main areas of operations are the following (as of December 1985): The FAR in the Peten and northern Alta Verapaz; the EG in the northern highland regions, principally in Quiché; and ORPA in the west and south, especially in San Marcos, southern Quezaltenango, Sololá and Suchitepéquez. There is occasional presence in Santa Rosa, Escuintla, Chimaltenango and Baja Verapaz. A new General Command of the three groups (the PGT-núcleo has not carried out a military action for at least three years) was announced towards the end of 1985. The army estimates the guerrilla fighting strength at 4,000; the US Embassy puts the figure at 2,000, and newspaper reports at 1,000.

The economic crisis and short-term instability

Whereas the military scored a temporary victory over the guerrilla forces, a solution to the five-year decline in the Guatemalan economy proved far more intractable. The decline had originated in the economic recession of the industrialised countries at the end of the 1970s, which sharply cut the price and demand for Guatemala's main agricultural exports. The recession also led to a major contraction of the regional market for Guatemala's manufactured exports, which in the 1960s and 1970s had come to represent just under 40 per cent of the total value of exports.¹⁶ In the twelve months leading up to the November elections, the economy spiralled further out of control and the country was widely regarded as facing its worst economic crisis since the 1930s. The GDP growth rate had fallen a cumulative 6.1 per cent from 1982-3, and although it had levelled out in 1984 (0.2 per cent), it was projected to fall again (by 1.6 per cent) in 1985. In the five-year period between 1980 and 1985, half of the economic growth of the previous thirty years had been lost, and GDP per capita was at the 1971 level. A paucity of foreign exchange reserves and a budget deficit projected to rise to Q 735 million in 1986 were the main structural causes of a rapid devaluation of the quetzal from a 60-year parity with the dollar until November 1984 to a black market rate of nearly 4 quetzales to the dollar by September 1985. The foreign debt, which historically had been manageable by Central American standards, had risen from US \$1,053 million in 1980 to US \$2,374 million in 1984, while the debt service ratio had reached 38 per cent of the value of exports (US \$500 million) in 1985. Inflation, which had remained in single figures for most of the post-war period, had risen to between 35 per cent and 40 per cent in the months leading up to the elections. By 1985 underemployment and unemployment were affecting around 45 per cent of the work force.

The principal political effect of the economic recession was to exacerbate the historical tensions between the army and the private sector over the running of the economy. Founded in 1957, CACIF (Comité Coordinador de Asociaciones Agrícolas, Industriales y Financieras) has functioned as the main representative of the Guatemalan private sector. Since the escalation of the civil war CACIF and the military have shared basic assumptions about the need to defeat

¹⁶ For a full explanation of the causes of the economic crisis, see *Inforpress Centroamericana*. 'Guatemala: elections 1985,' October 1985, pp 13-23.

the guerrillas, but have agreed on little else.¹⁷ These tensions are paralleled to the same degree in the rest of the region, largely because the exceptionally belligerent resistance of the Guatemalan right to even a modicum of social, economic and especially fiscal reforms, and because of the military's substantial stake in the Guatemalan economy. In general, the military have tried to extract appreciable tax concessions from the private sector (which pays one of the lowest rates of tax in the Western hemisphere¹⁸) to help to finance the cost of the war, while CACIF have attacked the military's large institutional and individual interests in state enterprises and public works projects.¹⁹ After the March 1982 Ríos Montt coup, the friction crystallised around a solution to a burgeoning fiscal deficit. The Lucas García government (1978–83) had overseen a massive increase in government spending, largely as a result of outright corruption, a rapid expansion of investment in public works projects and the rising cost of financing the war. Between 1978 and 1981 the deficit rose by a factor of 17, and increased from an average of 1 per cent of GDP in the years prior to 1978 to 7.4 per cent in 1981 (in numerical terms from Q 39 million to Q 683 million). Although Ríos Montt did reduce the deficit to around US \$300 million in 1983, his attempt to impose new taxes (a value-added tax (IVA) of 10 per cent) on the private sector was a major reason for his eventual removal in August 1983. Mejía Víctores initially appeased the private sector by reducing the IVA by 3 per cent, but the tensions soon resurfaced as the solutions offered by either side were bound to affect the economic interests of the other.

In June 1984 the IMF suspended the remaining US \$60 million of a US \$120 million stand-by loan because the government had failed

¹⁷ Although there are close links between the political parties and sectors of the business community, CACIF has tended to function as the most coherent political representative of the Guatemalan private sector (despite frequent sectoral disagreements within its membership).

¹⁸ Guatemala has the lowest tax ratio to GDP in Latin America. Tax income as a percentage of GDP amounted to 5.3 per cent in 1984, while the average for the rest of Central America ranged from 12 per cent to 31 per cent. Direct taxes on income and wealth (both personal and corporate) comprise less than one-fifth of all tax revenue, whereas for most other countries with market economies it is closer to 80 per cent.

¹⁹ In the last fifteen years individual generals have used their control of the state to acquire considerable personal fortunes (especially as owners of valuable land and mineral deposits), while the army as an institution has established a substantial economic base through its interests in around twenty state enterprises and especially through its own bank (El Banco del Ejército) and the IPM (Instituto de Provisión Militar), both of which have made large investments in financial and industrial projects. CACIF complain both of the 'Somocisation' of the economy which distorts the free market, and of the opportunities for personal enrichment offered by costly public works projects. Their *bête noire* is the Chixoy hydroelectric dam whose budget rose from US \$360 million at conception to US \$900 million by late 1985.

comply with its requirements of reducing the fiscal deficit to 3 per cent of GDP and establishing limits to the growth in credit from the internal banking system, which the IMF saw as the major cause of the excessive amount of money circulating in the economy.²⁰ Mejía Vítores finally moved to raise taxes in September 1984, by lifting some of the IVA exemptions that favoured the agro-export sector and introducing a new stamp tax. But the measures were clearly insufficient. The gravity of the crisis was finally recognised in November with the announcement of a 'state of emergency in international transfers' and the establishment of a parallel foreign exchange market. The parity rate was maintained for the import of essential goods and to honour the foreign debt, while a new rate of Q 1.40:US \$1 was formally introduced for most other transactions. The parallel rate was intended as a disincentive to luxury imports, but the measures resulted in a generalised rise in inflation as many companies used the opportunity to raise domestic prices, irrespective of whether the goods were affected by the higher exchange rate. When the Minister of the Economy, Leonel Hernández Cardona, blamed the rise in inflation on the private sector, CACIF responded by demanding his resignation. Mejía Vítores backed his Minister and even threatened to nationalise some businesses if the private sector did not collaborate with the government.

After another IMF visit in March, the government unveiled what amounted to its most comprehensive attempt at fiscal reform and its most concerted attack ever on CACIF. On 8 April, the Minister of Finance, Colonel Leonardo Figueroa Villate, announced a 15 per cent tax on non-essential imports from Central America and a 50 per cent tax on goods from outside the region. The package also raised interest rates from 12 per cent to 16 per cent, and included a tax on private education and some duties on coffee exports which had previously been tax-free. Mejía Vítores was explicit in asserting that big business and higher income brackets had to make sacrifices. The response of CACIF was both immediate and effective. A series of full-page advertisements demanded the withdrawal of the measures and the resignation of several Cabinet ministers. Threats to paralyse production and

²⁰ In the period from 1979 to 1984, 62 per cent of the budget deficit was financed by monetary emission from the Central Bank. The new money flooded the market and created an enormous demand for dollars, which in turn led to a rapid depletion in the country's monetary reserves (from US \$682 million in 1978 to a negative US \$422 million in December 1984). The inability of the Central Bank to meet the demand for dollars spawned a rapid increase in black market dealings and the inevitable drop in the value of the quetzal.

transportation were backed up by talk of withdrawing from a dialogue with the government. Five political parties denounced the measures more cautiously (so as not to isolate the Mejía government comprehensively that their short-term electoral future would be jeopardised), while the Constituent Assembly asked for a suspension of the tax proposals and urged a meeting between the government and CACIF.

The rumours of an imminent coup were so pervasive that a US Embassy spokesman in Honduras reported that it had already taken place.²¹ The army Chief of Staff, Lobos Zamora, was forced to announce that there would be no repetition of the coup to remove Ríos Montt (over his similar attempts to push through fiscal reforms), and reiterated the army's support for the Mejía government. The State Department for its part issued a strong statement against 'authoritarian democratic elements who were taking advantage of the situation to threaten the process of democratisation'. After a series of emergency meetings of the senior command, the government backed down. On 1 April, the Minister of Finance was replaced and five days later the tax proposals were repealed. By the end of the month the Minister of the Economy had been substituted by his deputy. In what was clearly a political manoeuvre designed to reduce the chances of a coup, the government then announced a 'National Dialogue' which called up CACIF, unions, university representatives, political parties, the church and the military to submit recommendations to solve the fiscal crisis. CACIF's response was the release of a 30-page document on 6 May, unsurprisingly blaming the government for the crisis, and calling for a 10 per cent cut in the budget, an end to government corruption, the privatisation of state enterprises, and a halt to government-sponsored speculation on the foreign exchange markets. When the National Dialogue ended on 21 June without reaching any conclusions, a new Technical Commission of Economic Advisers was formed and on 6 July proposed minor new taxes (on international transactions and airport dues) which were largely accepted by CACIF as short-term measures. The government had gained a temporary breathing-space, but the political implications of the April crisis were self-evident. CACIF had demonstrated its capacity both to block the implementation of major economic reforms and severely to curtail the regime's capacity to govern. Although the tension remained in the months coming up to 1

²¹ *Inforpress Centroamericana, ibid.*, p 16.

elections,²² a tacit consensus was reached that neither the economic crisis nor the impasse could be resolved until the Mejía government was replaced by a new civilisation administration.

What followed in September only served to emphasise the government's mismanagement of the economy and its short-term instability. The authorisation of a 50 per cent increase in urban bus fares at the end of August sparked off the first massive street protests in Guatemala City since 1978. Students were joined by housewives and the unemployed in nearly ten days of rioting around the capital. At least fifty buses were destroyed and more than Q 1 million reported in other damages. In all, ten people were killed, about 100 injured, 2,000 arrested, and around sixty 'disappeared'. The National University of San Carlos was occupied by the army for two days, which caused a further US \$1.5 millions' worth of damage. Even when the government revoked the bus fare increase on 4 September, the protests against the general rise in the cost of living continued for two days.²³ Although these protests were generally spontaneous and unorganised, work go-slows, which had begun in several government departments in August, escalated into a wave of strikes to push for wage increases.²⁴ In the face of a threat of a national strike, on 13 September Mejía Vítores was forced to grant a Q 50 a month bonus for some 200,000 state employees, and to announce a price freeze on 45 basic consumer items. At the height of the protests, there were strong rumours of another imminent *coup d'état*, and Mejía himself was widely reported to have expressed his willingness to resign, but was prevailed upon to stay on by the US Embassy and the political party leaders who feared his resignation would delay or jeopardise the elections.²⁵ In early October,

²² In August, the Central Bank announced that some US \$53 million due from agro-export sales had never reached the Bank as required by law. In what was widely considered a related incident, Roberto Castañeda Felice, the President of AGA (Asociación Guatemalteca de Agricultores), an affiliate of CACIF, was gunned down on 12 August in Guatemala City. This was rumoured to be a government-directed reprisal for CACIF's rejection of the economic reforms.

²³ Between August 1984 and September 1985 the Consumer Price Index rose by 35 per cent, compared to a fall of 2 per cent in the corresponding period the year before. The price of beans, for example, had increased three-fold since the end of 1984, from 24 centavos a pound to between 60 and 75 centavos.

²⁴ The most important of these were the teachers' union, and public sector workers in the Finance Ministry, the Judiciary, Public Health, Public Works, Social Security, Waterworks and the General Electric Company. The national teachers' strike organised by the CNM (*Consejo Nacional del Magisterio*) spread to twenty of the country's twenty-two departments and was only temporarily resolved by the government's unilateral suspension of all classes until the new school year in January 1986.

²⁵ *New York Times*, 6 September 1985.

both the Minister of Finance and the President of the Central Bank resigned over the pay awards and the government's failure to endorse an official devaluation of the quetzal, thus bringing to four the number of senior government appointees who had been replaced or had resigned over the handling of the economic crisis. Without the promise of the November elections, the Mejía government would probably not have lasted the year.

The relationship between the economic crisis and the electoral process was not straightforward. On the one hand, the sharpened conflict with the private sector in April and the protests in September nearly provoked military coups that would have inevitably postponed the Presidential elections. However, the overall effect of the crisis was to convince the majority of the senior command, the private sector and the traditional right-wing parties of the need for a civilian regime in which, it was hoped, would have a more legitimate base for addressing the economic decline. If a solution was not found in the immediate future, the army ran the risk of a rapid increase in popular demands for more fundamental reforms. A withdrawal from formal power would also offer the short-term political advantages of dissociation from the national crisis, a solution to the Mejía government's temporary instability, and a lessening of the tension between the regime and the private sector. But the main benefit of a civilian President was always perceived to be that of increasing the chances of a substantial increase in economic aid and investment, both as a way out of the economic morass and to help finance the counter-insurgency budget (which in nominal terms consumed about 17 per cent of the national budget, but in real terms around 30 per cent).²⁶ Because the Mejía government had manifestly failed to show any significant break with its predecessor's human rights record,²⁷ the US Congress had several times blocked the Reagan Administration's efforts to raise the amount of military and economic aid to the Mejía regime. The International Security and Development Cooperation Act of 1985 had stipulated that future

²⁶ *This Week* (Guatemala City) 25 November 1985.

²⁷ The assassination of two leaders of the only human rights group in Guatemala, the *Grupo Apoyo Mutuo* (the Mutual Support Group), in March and April 1985 attracted the most international attention. See especially, Americas Watch, *The Group for Mutual Support*, New York, 1985 and Amnesty International, *Memorandum presented to the Government of Guatemala following a Mission to Guatemala in April 1985*, London, February 1986. The Embassy in Guatemala, which tends to underestimate the figures, reported 373 political assassinations and 135 disappearances in the first seven months of 1985.

assistance would be conditional on a transition to civilian rule.²⁸ Moreover, throughout the course of the year, the US Ambassador to Guatemala, Alberto Martínez Piedra, and the US State Department frequently stated their willingness to send increased amounts of aid once a civilian government had been voted in. A new regime held out the additional possible advantage of a reconciliation with the IMF, which had clearly indicated over the previous year that it did not consider the military regime capable of implementing any arrangement which would warrant an extension of loans. Guatemala's international isolation, the regime's lack of domestic legitimacy and the economic crisis could all benefit from a return to civilian rule. But the army also needed an electoral result in which there would be no fraud, no military candidate and no obvious military preference, so that no-one could doubt the purity of the event.

The reconstruction of the centre

The sixteen months of electioneering between the Constituent Assembly elections of July 1984 and the Presidential elections of 3 November 1985 were nearly eclipsed by the scale of the economic crisis. However, eight candidates and twelve parties did finally contest the first round (see Table 1). The plethora of parties gave the impression of genuine political pluralism, but by most criteria only the small Social Democrat Party (PSD), which is affiliated to the Socialist International, could convincingly be described as left of centre.²⁹ Nevertheless, the period was politically significant for the decline and fragmentation of the traditional ultra-right wing parties which had dominated the tolerated political space for the previous fifteen years, the consolidation of two new self-defined centrist parties, and the *derechización* (right-wing drift) of the Christian Democrat Party. The four major candidates shared the common aspiration of staking out the 'middle ground' for their parties or alliances. Although there were nuances of disagreement over economic and foreign policy, the real significance of

²⁸ Section 703(a)(1) required that the President certify to Congress that 'an elected civilian government is in power in Guatemala and has submitted a formal written request to the US for assistance, sales, or financing to be provided.'

²⁹ After a personal meeting between Mejía Victores and PSD leaders in Costa Rica in January 1985, the party announced its decision to contest the elections after four years of semi-clandestinity. Not all the leadership (including Juan Alberto Fuentes Knight, the son of the founder of the party, Alberto Fuentes Mohr) subsequently returned, arguing that their participation would only lend credence to the democratic facade.

Table 1: Votes cast for presidential candidates (Round 1, 3 November 1985)

Party/Coalition	Candidate	Votes	% of Valid Votes
DCG	Vinicio Cerezo Arevalo	648,681	38.65
UCN	Jorge Carpio Nicolle	339,522	20.23
PDCN/PR	Jorge Serrano Elías	231,397	13.78
MLN/PID	Mario Sandoval Alarcón	210,806	12.56
CAN	Mario David García	105,473	6.28
PSD	Mario Solórzano Martínez	57,362	3.41
PNR	Alejandro Maldonado Aguirre	52,941	3.20
PUA/MEC/FUN	Leonel Sisniega Otero	32,128	1.91

Source: Tribunal Supremo Electoral

Note: Approximately 3.8 million Guatemalans are of voting age, of whom 2.75 million (72 per cent) had registered. The total number of votes cast was 1,886,952 (68.5 per cent of those registered) of which 1,678,300 were valid, 146,034 spoiled, and 82,618 left blank. Absenteeism was therefore 31.5 per cent (relative to registration), or 50.3 per cent (relative to eligibility). Of the 2.75 million who registered, just over 1 million (37 per cent) were unable to read or write.

Acronyms: DCG = Democracia Cristiana Guatemalteca; UCN = Unión del Centro Nacional; PDCN = Partido Democrático de Cooperación Nacional; PR = Partido Revolucionario; MLN = Movimiento de Liberación Nacional; PID = Partido Institucional Democrático; CAN = Central Auténtica Nacionalista; PSD = Partido Socialista Democrático; PNR = Partido Nacional Renovador; PUA = Partido Unificación Anticomunista; MEC = Movimiento Emergente de Concordia; FUN = Frente de Unidad Nacional.

the parties' programmes lay in their shared promises *not* to carry out certain measures. Within four weeks of the Constituent Assembly elections, the limits on the political agenda were clearly marked out. In a public forum on 25 July 1984, Vinicio Cerezo of the DCG concurred with the other leading candidates that there would be no banking or agrarian reforms, and no nationalisations of private property or companies. In the weeks that followed, there was a similar agreement over the need to avoid 'Argentina-style' prosecutions for past human rights violations. With the most moderate candidate offering such solid guarantees to both the army and the private sector, the Mejía regime did not need to interfere too openly in the elections. The advantages of overseeing a relatively free electoral process far outweighed any particular preference that sectors of the army may have held.

The parties of the traditional ultra-right, such as the MLN, CAN and PID (Partido Institucional Democrático), which broadly represented military agro-export and business interests in the 1960s and 1970s, lost

much of their traditional constituency to the more moderate options offered by the UCN and the PDCN (Partido Democrático de Cooperación Nacional).³⁰ In part this was due to their internal fragmentation. Prior to the Constituent Assembly elections, the small PUA (Partido Unificación Anticomunista) had split from the MLN. It was led by Leonel Sisniega Otero, who had long been frustrated by the MLN's antediluvian leader, Mario Sandoval Alarcón, and his iron grip on the leadership of the party. The MLN, PID and CAN had joined forces to fight the Constituent Assembly elections, but in January 1985 CAN broke with the alliance when they were refused the Vice-Presidential ticket. The MLN's decline was also due to the aggravation of its historical differences with sectors of the military. Whereas the PID had maintained a more harmonious relationship with top generals, since the mid-1970s the traditional agro-export sectors represented in the MLN had opposed the military's 'statist' tendencies. The economic crisis of the early 1980s accentuated the underlying antagonism and led to a significant withdrawal of military support from the party. But, more importantly, there was a clear understanding within sectors of the army that the victory of an ultra-right candidate would not serve their aim of being welcomed back on to the list of civilised nations and thereby receiving more aid. The MLN once again insisted on the Presidential candidature of Sandoval for their alliance with the PID. Although Sandoval attempted to moderate his party's historical positions, the 'D'Aubuisson factor' came into play.³¹ The international climate favoured new 'moderate' faces which could not be so easily associated with an identifiable semi-fascist ideology or past (or future) acts of repression.

The UCN and the PDCN were both formed to contest the 1984 Constituent Assembly elections, and shared the common aspiration and advantage of presenting a fresh, moderate and modernising image. Their joint aim was to wrest space from the traditional right and to

³⁰ The MLN are the political heirs to the 1954 coup, and are internationally notorious for their fascist sympathies and their organisation of rural paramilitary death squads in the late 1950s; the PID was formed by the army in 1965 and is comprised principally of state functionaries and high-ranking military officers who benefited from state-owned businesses, especially under Lucas García; the CAN was originally a creation of some business sectors (especially industrial and financial capital) and military officers who supported President Arana (1970-74)—the new leadership tried to distance itself from the old association.

³¹ Sandoval's name is usually not put down in print without quoting his description of the MLN as the 'party of organised violence'. In fact he was referring to the MDN (Movimiento Democrático Nacional), the predecessor to the MLN, but it is hard to pinpoint any major ideological differences between the two parties.

distance themselves from the alleged radical tendencies of the DCG. Their economic policies differed from the MLN in their resistance to purer forms of monetarism, but in general they proffered orthodox conservative measures (with the emphasis on improved agricultural production, more efficient use of unutilised and state-owned land, and better collection of tax revenue), but no mention of serious reforms.³² The PDCN's candidate, Jorge Serrano Elías, who was a promoter of the fundamentalist 'Church of the Word' and the former head of the Council of State under Ríos Montt, claimed a substantial base amongst the national cooperative movement and Protestant sectors, while the appeal of the UCN depended more on the media packaging of its leader, Jorge Carpio Nicolle, through his two newspapers *El Gráfico* and *La Razon*, than on any defined ideology or social base. Both Serrano and Carpio Nicolle were frequently rumoured to be the unofficial candidates of the private sector, the army or the US. The PDCN undoubtedly received substantial backing from commercial sectors and some cotton-growers and coffee farmers who deserted the MLN, whereas Carpio's seemingly inexhaustible campaign funds raised further speculation about his sources of finance and his political independence from the army.³³ It was frequently alleged that the outgoing Foreign Minister, Fernando Andrade Díaz-Durán, organised support for Carpio among army officers and the private sector as part of a longer-term personal ambition to promote his own bid for the Presidency.³⁴ The break-up of UCN's alliance with the equally conservative PR (Partido Revolucionario) in March over the UCN's alleged backers and with the PNR (Partido Nacional Renovador) in July helped to stymie the Andrade project and seriously weakened the UCN's chances. The fact that only two years after their formation both parties could seriously contend for the Presidency only served to highlight the fragility of their social base and the atrophy of open electoral politics in the 1970s and 1980s. The true Guatemalan centre parties—the social democratic FUR (Frente Unido de la Revolución) and the PSD—had been wiped out by the Lucas Administration at the end of the 1970s in a deliberate attempt to pre-empt the 'moderate option' (and to force the Carter Administration to side with the right).

³² See *Inforpress Centroumericana*, *ibid.*, pp 24–43, for a full description of all the parties' candidates and programmes.

³³ Carpio Nicolle is said to have received substantial funds from the Banco del Ejército to help the reactivation of his newspaper, *El Gráfico*, after the earthquake in 1976.

³⁴ See for example, *This Week* (Guatemala City) 25 March 1985.

The death of the genuine centre had led, in the early 1980s to the further polarisation of Guatemalan politics, which had clearly not been halted by the arrival of new self-proclaimed centrist parties.

The main challenge for the DCG was to convince the army and the right that any reformist tendencies the party may have inclined to in the past were kept firmly in check. Although the DCG was founded in 1955 under the influence of the Social Christian doctrines of the early Cold War period and initially formed alliances with the MDN, by the late 1960s it had adopted a more liberal (but still anti-communist) position and had some support in urban middle class sectors and Indian communities. As part of the FNO (Frente Nacional Opositora) alliance for the 1974 elections they offered a moderately reformist platform (including minor land and fiscal reforms). Their candidate, Ríos Montt, was widely considered to have won the vote, but not the count.³⁵ Their base began to disintegrate in the late 1970s, especially after the death of around 300 of their middle-ranking and provincial leaders as a result of Lucas García's general offensive against the centre. By 1982 the party had largely abandoned its earlier commitment to reforms, as evidenced by its reluctance to condemn the escalation of large-scale repression of Indian communities under Ríos Montt.³⁶

The DCG programme for the 1985 elections confirmed the party's essentially conservative roots and left them with a political identity well to the right of their sister parties in El Salvador and Honduras. Although Vinicio Cerezo represents the more progressive wing of the party, he was held in check by the more conservative sectors under the influence of René de León Schlotter, whom Cerezo had ousted from the leadership at the end of the 1970s.³⁷ His constant assurances of the 'irresponsibility' of an agrarian reform convinced all but the most *atrasados* (reactionary) sectors of landed capital that any threat to their privileges lay firmly in the past. Although vague commitments were

³⁵ The experience of the FNO was similar to that of the UNO (Unión Nacional Opositora) in El Salvador in 1972, whose victory was also blocked by the military. After General Kjell Laugerud had been declared the winner in the 1974 Guatemalan elections, Ríos Montt quietly left Guatemala to become the Ambassador in Spain (allegedly after a payment of US \$1 million).

³⁶ For a fuller history of the DCG, see Gabriel Gaspar, *La estrategia de la Democracia Cristiana en Centroamérica*, Mexico: CINAS, September 1985.

³⁷ René de León Schlotter is an ex-member of the MLN and ex-head of the World Christian Democrat Movement. He attended the Santa Fé Committee in 1980, which formed the basis of discussions between the 'new right' in the US and the international Christian Democrat movement as to the viability of a middle path between military authoritarianism and more left-wing options as a way of combining counter-insurgency and 'legitimate' governments. In general, the right-wing sectors were responsible for blocking Cerezo's attempts to form alliances with small centre-left groups or with the PR. See *Inforpress Centroamericana*, *ibid.*, p. 27.

made to increase taxes and introduce new programmes in education health care, the main thrust of their plan for economic reactivation in new flows of economic aid from abroad and a renegotiation of foreign debt. The presence of important business representatives with the DCG and the general reassurances about the need to avoid any form of nationalisation were sufficient for CACIF to give an alleged Q 40. to the Christian Democrat campaign. The army too was reassured the 'new moderation' of the DCG and their rejection of prosecutions of the military for past corruption or human rights violations. Moreover, according to some reports, by the time of elections most of the senior command, including the old guard, swung their support behind Cerezo after he had humiliated Canicollé in a televised debate.³⁸ There was also frequent speculation about a possible agreement between the military and the DCG although this was always rumoured to be verbal and not a rerun of Méndez's formal 16-point agreement with the army in 1966. Whether or not this had in fact taken place, it was clear that both the military and private sector could live happily with the Christian Democrat project.

Nor was the prospect of a DCG victory a major source of concern to the State Department. Since the beginning of the 1980s they successfully nurtured a close relationship with the Christian Democrat party in El Salvador as the most efficient way of providing a degree of cover for their pursuit of a military victory against the FDR-FMLN. The only disadvantage to them was Cerezo's desire to continue Guatemala's 'active neutrality' in the region, whereas the three other main candidates favoured a policy of greater hostility towards Nicaragua. Although the 1983 Mejía Víctores coup was widely interpreted as heralding a closer alignment with Washington's attempts to destabilise the Sandinistas, the Mejía regime had soon returned to a policy of gentle support for the Contadora process, a refusal to react to CONDECA and an avoidance of public statements in support of contras in Honduras. The policy of non-alignment was deftly promoted by Fernando Andrade, the Foreign Minister, and stemmed not from any sympathy for the Sandinistas but from an astute recognition of political advantages of improved relations with Western European and Latin American countries (especially Mexico) as a way of reducing

³⁸ A week before the elections, Cerezo is said to have circulated what he claimed was a memorandum from military intelligence predicting a victory for the DCG on the strength of the party's ties with the military and the US. See Allan Nairn in *Village Voice* (New York) 11 November 1985.

international isolation and deflecting criticisms of its human rights record. (There was little to gain from a close alignment with the Reagan Administration—the US Congress would probably have continued to vote against increased amounts of economic and military aid on human rights grounds). Andrade's policy found general support from the army because of its fierce chauvinism and post-1977 antipathy towards the US, its concern over diverting troops and attention away from its own civil war, and its general disdain for close cooperation with its counterparts in Honduras and El Salvador. However, even if the US may have preferred a more anti-Sandinista candidate, in general they were keen to support the electoral process in the hope of increasing their political leverage over the new government, whichever party came out on top.³⁹

The victory and prospects of the Christian Democrat Party

In the first round of the elections on 3 November, Vinicio Cerezo won a clear majority of 300,000 votes over his nearest rival, Jorge Carpio Nicolle, which meant that the two had to contest a second round a month later on 8 December (see Table 1). The DCG also won an absolute majority in Congress, winning fifty-one of the 100 seats to the UCN's twenty-two and the twelve of the MLN-PID.⁴⁰ The MLN-PID alliance complained of a 'sophisticated fraud' in the use of the computer technology for counting and monitoring the vote, and of discrepancies in certain areas between the number of people registered and the number of votes cast. However, the local interpretation was that the MLN-PID's allegations stemmed more from disappointment at their poor showing than from any widespread fraud.⁴¹ The official US

³⁹ The US Embassy and State Department acted as major publicists for the electoral process, distributing large quantities of background briefing papers. The US government also granted US \$234,000 to the Tribunal Supremal Electoral, but in general the role of the US in the Guatemalan elections was not as direct as in the March 1984 elections in El Salvador or the November 1984 elections in Nicaragua.

⁴⁰ The rest of the seats were shared by the PDCN-PR (eleven), the PSD (two), the PNR (one) and CAN (one). The DCG also took Guatemala City and twenty of the country's twenty-two departments, including the western highland departments affected by the civil war, and the eastern regions, where the MLN had traditionally enjoyed its strongest level of support. Of the 100 deputies, only five were from the Indian ethnic groups, when Guatemala's population is between 50 per cent and 70 per cent Indian.

⁴¹ See *Inforpress Centroamericana*, Guatemala City, no. 666. The MLN-PID only made the accusations after it was clear they were losing. They compared their alleged experience with US support for the Christian Democrats in the Salvadorean elections, and named John Kelly of AID as the person responsible for the fraud in both countries.

Government team of observers, headed by Richard Lugar, described the first round as 'fair and free', but an independent delegation sponsored by the Washington Office on Latin America and International Human Rights Law Group stressed the general climate of political violence 'in which parties and voters were subject to various forms of intimidation', and the degree to which some of the population, especially Indian, voted through fear of the various penalties for voting.⁴² In general, the international response was that the 1985 regime had accomplished its aim of a free and fair election, by which it meant free of fraud and military candidates. While many observers were quick to emphasise these new and surprising additions to recent Guatemalan electoral history, there was little mention of how well it fitted the army's requirements for the elections. Criticisms of the human rights context, the general level of fear amongst a large percentage of the population and the lack of genuine pluralism were also largely absent.⁴³

In the second round of 8 December, Cerezo gained 68 per cent of the valid votes, giving him a higher vote than the total number of votes for all three candidates in the 1982 elections (see Table 2). Cerezo won by a wider margin and more total votes than any Guatemalan President since Juan José Arévalo in 1944. The size of his majority and the large number of demonstrators present at Cerezo's victory made it impossible to deny that Cerezo had considerable, if temporary, popular support.⁴⁴ In part this was due to Cerezo's personal popularity and the DCG's more impressive electoral campaign. But Cerezo was considerably helped by Carpio's failure to unify the defeated right-wing parties and the private sector behind his anti-Cerezo campaign. In the five weeks before the second round, the PNR, the PSD, one faction of the PR and the Executive Committee of the PDCN all offered qualified support for Cerezo, while the MLN and the CAN re-

⁴² See the Report of the delegation sponsored by WOLA and the International Human Rights Group, *The 1985 Elections: Will the Military Relinquish Power?*, Washington DC, Dec 1985, p. vii. Mejía Victores announced in the week before the elections that those who voted would not be granted visas for business, travel or immigration. Newspaper advertisements sponsored by the military stated that it was traitorous to abstain or to vote null or blank.

⁴³ In a characteristically bold equation of elections and democracy, the US State Department's October 1985 briefing paper described the elections as 'the final step in the establishment of democracy in Guatemala (emphasis added)'.

⁴⁴ Left-wing critics pointed to the high level of abstentions in both the first and second round (35.5 per cent and 34.5 per cent respectively, relative to registration), but by historical standards despite the penalties for not voting, these figures were relatively low.

GUATEMALA IN CIVILIAN GARB

Table 2: Votes cast for presidential candidates (Round 2, 8 December 1985)

Party	Votes	% of Valid Votes
DCG (Vinicio Cerezo)	1,133,517	68.37
UCN (Jorge Carpio Nicolle)	524,306	31.63
Total	1,657,823	100.00
Spoiled Ballots	127,913	
Blank Ballots	14,588	
Abstentions	953,816	

Source: Tribunal Supremal Electoral

their affiliates to vote for whichever candidate they preferred.⁴⁵ Carpio was forced to rely on a strategy of trying to paint the DCG as 'internationalist' and 'leftist' as against the UCN's 'nationalism' and 'centrism', but such accusations were hardly likely to frighten either the army or the private sector when the DCG had already succeeded in reassuring both groups by rejecting any reforms that would harm them. Moreover, as Alfonso Cabrera, the Secretary-General of the party, had candidly pointed out in the week after the first round of the elections, 'The Christian Democrat party in Guatemala, as in many other countries of the world, had been formed to stop Marxist expansionism.' But the most convincing explanation of the DCG's success lay in their reputation for being the party least involved in the corruption and repression of previous military governments. In general, the results were interpreted as a vote against the military and the parties closest to them, as all the traditional parties (with the exception of the PR who were in alliance with the PDCN) had come well down the list in the first round. Although in the previous fifteen years the DCG had been prepared to enter pacts with right-wing parties and to legitimise military governments by participating in a series of electoral frauds, the fact that they had never actually assumed office offered the most appeal to the middle classes, who were tired of the army's corruption and

⁴⁵ The MLN argued that the campaign against communism was the MLN's task, and not that of the UCN. The business community were not totally happy with the results of the first round, but never seriously considered a victory for Carpio in the second round. According to *This Week* (Guatemala City), 9 December 1985, Cerezo received substantial contributions from the business community for his runoff campaign.

mismanagement of the economy, and the popular sectors, who voted for the candidate least associated with army repression.

The scale of the economic crisis and the fact that the army had largely dictated the rationale and dynamic of the return to civilian rule clearly established the limits on Cerezo's power and his room for manoeuvre. Despite Cerezo's obvious short-term popularity and the DCG's majority in Congress, Cerezo was bound to have to walk a narrow tightrope in his relations with the army, the private sector, the popular organisations and the URNG. His new Cabinet, announced days before his inauguration, was carefully constructed not to antagonise either the private sector or the military, and included only three representatives of the party's left wing.⁴⁶ Although the appointment of General Hernández Méndez as Minister of Defence was widely interpreted as a victory over the military hardliners' choice of the outgoing Chief of Staff, Lobos Zamora, Cerezo held true to his promise of not prosecuting any of the military for past offences. The arrest of 600 members of the DIT (*Departamento de Investigaciones Técnicas*), the intelligence branch of the National Police, on 4 February was a significant political gesture to convince international and internal public opinion of his intentions to act against human rights violations, but the army's own intelligence branch (G-2) and the whole counter-insurgency structure in the rural areas remained largely intact.⁴⁷ One of Cerezo's main challenges, therefore, was to adhere to his guarantees to the army, while at the same time avoiding a collision course with the *Grupo de Apoyo Mutuo* and other affected groups who were demanding justice for past violations. Moreover, the probability of future human rights violations seemed high. The DCG project involved both ample guarantees to the private sector and more 'popular' guarantees of the rights of association and trade union organisation, in part to satisfy its own base in the trade union movement through the CUSG (*Confederación de Unidad Sindical Guatemalteca*). In the context of

⁴⁶ Only the Ministers of Labour, Health, and Sports and Culture are considered to be on the left of the party. See *The Economist Intelligence Unit*, Quarterly Economic Review of Guatemala, El Salvador and Honduras, London, no. 1, 1986.

⁴⁷ The DIT is widely regarded as a relatively independent and isolated branch of the security apparatus, and therefore easier to dismantle. Just before Cerezo's inauguration, the Mejía regime rushed through Decree Law No 8-86, which granted a total amnesty for anyone responsible for political crimes in the period since the Ríos Montt coup—at the time of writing, the law had not been repealed. On 14 February 1986 Cerezo presided over the inauguration of a new public works project in the Chisec development pole, which was a clear indication of the new government's approval of the army's 'development' strategy for the rural areas.

rising popular protests created by the economic crisis and the expectations generated by the new government, such a combination of guarantees seemed doomed to be resolved in the long term by more repression of the poorer sectors.

Cerezo's room for manoeuvre on economic policy had been marginally increased by a slight recovery in the economy in the last three months of 1985 and by a series of measures rushed through by the Mejía regime before Cerezo's inauguration. By the year-end, the quetzal had risen to around Q 3 : US \$1 and some payment of the debt had been released, largely due to more revenue accruing from the agro-export sector. One of Mejía's last acts was to introduce new taxes on luxury imports and property, a 3.5 per cent tax on international transactions, and the compulsory purchase of quetzal-denominated bonds. The levying of luxury taxes coincided with the imposition of a new Central American tariff legislation (known as *regla-3*) which entailed a two- to three-fold increase in duties payable on goods imported from outside Central America and a substantial increase in government revenue. But despite these measures and the prospect of a possible doubling of revenue from coffee sales (because of the rise in world prices) and a decline in oil prices, the outlook for 1986 still remained bleak. The 1986 budget involved a deficit of Q 735 million, while the debt requirements for 1986 had risen to US \$600 million.⁴⁸ Cerezo's best hope still seemed to lie with renewed flows of aid from abroad, but doubts remained over whether these would be sufficient to halt the economic decline, and over the possible political price attached to any new loans from the US. Cerezo could expect significant bilateral aid from the EEC, the *International Christian Democrat movement* (especially Venezuela and West Germany) and the Reagan Administration, but it was hard to argue that these would be forthcoming in sufficient amounts to meet the country's needs. Moreover, the Reagan Administration would be likely to seek important concessions on Guatemala's foreign policy if it were to raise its level of support to that of its major allies in El Salvador and Honduras.⁴⁹

⁴⁸ The government's policy on the renegotiation of the debt and a possible devaluation of the currency had not been decided at the time of writing.

⁴⁹ The EEC have agreed a substantial increase in their current aid of sterling £23 million, but the money will be shared between six Central American countries; the West German government has granted US \$22 million in soft loans; the Venezuelan government could save the Cerezo government an estimated US \$160 million on its oil bill by an alteration in the San José agreement; the Reagan Administration has pledged US \$91 million for fiscal years 1986 and

Nevertheless, it was in the international arena that Cerezo enjoyed the most leeway. His foreign policy was essentially a continuation of the one pursued by the Mejía regime, but the main difference lay in its higher international profile. Soon after his victory in the second round of the elections, Cerezo went on a whirlwind tour to the US, Europe and the other Central American countries in an attempt to seek both aid and support for Guatemala's 'active neutrality' in the region. At his inauguration ceremony, a major new impetus was given to the Contadora process by the so-called 'Declaration of Guatemala' which was signed on 15 January 1986 by all the Central American countries (except Costa Rica, but including Panama). The Contadora countries also declared their support for his proposal for a new Central American parliament.⁵⁰ Most Latin American and European governments welcomed Cerezo's Presidency for the advantages offered by a 'democratic' regional government supporting their own efforts to seek a negotiated solution to the regional crisis. However, it remained to be seen how far the support would extend to new flows of aid and reduced criticisms of human rights violations. Cerezo's problems remained largely domestic, and stemmed not only from the severe limits set by the army on the 'democratic opening', but also from the very nature of the DCG programme. As in El Salvador, the key question was whether a Christian Democrat project could do anything to halt the acute social conflict inherent in highly polarised Central American societies when Christian Democrat parties are unable, or unwilling, to confront the traditional holders of economic and political power and cling to the conviction that change can be achieved within existing political structures. Since 1966 elections in Guatemala have provided legitimacy for counter-insurgency programmes and have not announced major shifts in political power. There was little to suggest in the victory of the DCG that the 1985 elections marked a significant departure from the pattern.

1987, although this figure could well be increased. For projections of Guatemala's foreign aid and investment requirements, see *Inforpress Centroamericana, Guatemala: Elections 1985*, pp 22-3. Guatemala has received only US \$120.3 million in economic aid over the last six years from the US, compared to US \$1,022 million for El Salvador, US \$495 million for Honduras, US \$637 million for Costa Rica, and US \$112.5 million for Panama. Costa Rica, El Salvador and Honduras are aligned with the Reagan Administration's policy on Central America.

⁵⁰ This would be modelled on the European Parliament in Strasbourg and would aim to resolve the region's problems without foreign interference.

The Baghdad raid: retrospect and prospect

Conduct by a state widely believed to be a nuclear-weapon country, Israel's destruction of Iraq's safeguarded research reactor (Osiraq) on 7 June 1981, opened inter-state controversies and stirred broader issues that are still active five years after the event. Israel's attack, using US-supplied aircraft, challenged the non-proliferation regime in the form of International Atomic Energy Agency (IAEA) inspections accepted by Iraq as an adherent of the Nuclear Non-Proliferation Treaty (NPT). The raid also called into question the right, affirmed in the NPT, of nuclear suppliers and developing nations to engage in nuclear commerce and peaceful exploitation of the atom under IAEA monitoring.

Pledging to repeat military assaults on any Israeli adversary's nuclear facilities deemed by Israel to be a threat to its own security, a Begin Government post-strike declaration raised the possibility of additional regional violence centring on nuclear activities. These activities might eventually include a nuclear-weapons programme to confront Israel's regional nuclear-bomb monopoly. Unprecedented in world affairs, the raid also stirred visions of Israeli-style conduct by states in other regions having intense political and nuclear rivalries. Moreover, the attack provoked questions about the efficacy and follow-on responsibilities of the UN, the non-proliferation regime and major actors, notably the US.

It is the purpose of this article to review and assess the origins, event and aftermath of the Osiraq episode in national policies, international organisations and world politics. Attention is also given to the current status and likely future of nuclear affairs in the Middle East. A major norm for assessment is the non-proliferation ethic. The standard should be clarified by a recognition that because an absolute curb on proliferation beyond the five acknowledged nuclear-weapon states has not been possible, there are reasons for believing that additional spread may well take place in this century, though not necessarily in the Middle East. The ultimate norm is prevention of nuclear war.

Background conditions and policies

The Osiraq episode cannot be understood apart from nuclear conditions and related policies in the Middle East prior to mid-1981.¹ Except for Israel, Middle Eastern states had not progressed in nuclear affairs beyond a few cases of small research reactors or power reactor ambitions, as in the instances of Egypt and Iran. Between 1961 and the 1967 war the Nasser regime in Egypt demonstrated an interest in securing a nuclear arms or at least a rocket answer to Israel's unacknowledged nuclear bomb status; but after the 1967 débâcle the pre-Sadat leadership accepted its neighbour's nuclear advantage. Successive Cairo governments have continued to recognise this condition. Egypt's moves to make peace with Israel and to ratify the NPT without waiting for Israel to do the same virtually excluded the remote possibility of the largest Arab state ever having a nuclear bomb programme. These measures improved the chances for Egypt to obtain one or more nuclear power reactors to add to its small research reactor supplied by the Soviet Union in the Nasser era.

Having abundant oil-wealth, but also costly development and military budgets, and political ambition, Iran, Libya and Iraq entered nuclear affairs on varying schedules. An early NPT adherent and partisan, imperial Iran projected euphoric power reactor plans, which the Islamic revolution suspended and later revived on a limited basis. Signing the NPT in 1975 at the probable insistence of the Soviet Union, but ratifying the treaty only in 1981, the Qaddafi regime made unsuccessful efforts to secure bombs from China and sensitive nuclear technologies from several countries. Reports of Libyan financial aid and trans-shipment of Niger-originated uranium to Pakistan raised the promise or the spectre of an Islamic Bomb. Becoming highly controversial for a host of reasons, Libya has experienced a delay in the Soviet fulfilment of a 1977 contract to supply Libya with a safeguarded power reactor.

Arab nuclear policies must be viewed in the context of the Israeli nuclear evolution to which the Arab states have responded.² Israel

² Israel's nuclear status is explored in Yair Evron, 'Israel and the Atom', *Orbis* (18) Winter 1974, pp 1326-43; 'How Israel got the bomb', *Time* 12 April 1976; *Israeli Nuclear Armament* (United Nations) A/36/431; Fuad Jabber, *Israel and Nuclear Weapons* London: Chatto and Windus, 1971; Amos Perlmutter, 'The Israeli raid on Iraq', *Strategic Review* (10) Winter 1982, pp 34-43;

began early in its history to prepare for a nuclear future with the aid of Western-trained scientists and a small, safeguarded research reactor provided by the US. Some Israeli leaders, including Yitzhak Rabin and Yigal Allon, were inclined to rely upon conventional military superiority and oppose a nuclear-bomb option. But David Ben Gurion, Shimon Peres and Moshe Dayan led the development of a covert, dedicated programme seeking nuclear arms or the ready-to-assemble components thereof. Israel's long-standing posture that it would not be the first to introduce nuclear weapons into the Middle East was undermined by anyone wishing to recall US aerial or sea patrols in the 1950s.

Israel acquired a nuclear-bomb monopoly in the Middle East many years before the Osiraq affair. The breakthrough may have come in the 1960s. Both Labour and Likud-led coalition governments acted to maintain the monopoly, and to do so in a basement mode. A 'bomb-on-the-table' strategy urged by Moshe Dayan after the 1973 war was never adopted. The policy of calculated ambiguity unsettled adversaries having no nuclear deterrent and leveraged conventional arms sales from a pliant US.

Important steps in Israel's nuclear evolution were Franco-Israeli agreements resulting in France's provision of a large, unsafeguarded research reactor located in the secret Dimona complex where plutonium production may have begun in 1963; French reprocessing of spent fuel for Israel; the construction of an unsafeguarded re-processing facility in Dimona; and development of a 260-mile range missile capable of carrying nuclear warheads. France may have shared nuclear testing data with Israel.

President Dwight D Eisenhower's efforts which made Ben Gurion evacuate Israeli forces from the Sinai after the Suez War are well known. Less well publicised is an Eisenhower inducement for the withdrawal—a written pledge (which subsequent presidents renewed) stating that the US will not hinder any Israeli plans to acquire nuclear weapons.³ The agreement may operate chiefly in 'grey market' and dual-use areas. However, the existence of the accord may help to explain other matters. Among them is the 'loss' of highly enriched

and Peter Pry, *Israel's Nuclear Arsenal* Boulder, Colorado: Westview, 1984. Iraq's pre-raid policy is not explained, but Israel's nuclear hypocrisy is charged in Salah al-Ali, 'Iraq nuclear policy', *Arab Perspectives* (1) October 1980, pp 16–19.

³ 'America's nuclear pledge to Israel', *Foreign Report*, published by *The Economist* (London), 21 January 1981.

uranium from a Pennsylvania plant beginning in 1962 which the CIA believes probably passed to Israel. Also relevant is the 1968 disappearance in European waters of a large shipment of processed uranium ore, which Israel reportedly acquired.

Before the Osiraq controversy, the US did take some non-proliferation measures respecting Israel. Following intense Kennedy Administration interest in non-proliferation and the 1963 emergence of the Eshkol Government, which was opposed to nuclear bombs but did not debate them in public, the Johnson Administration secured limited American inspections of Dimona and found no evidence of separated plutonium. Subsequently, pro-bomb Israeli leaders returned to power and ended the inspections.

As the US provided increasing amounts of economic and military aid to Israel after its demonstration of military prowess in 1967 and a surge in American Jewish activism, the US did not make the transfers dependent on Israeli's full compliance with the non-proliferation regime. Despite Israel's 1968 vote for the NPT in the UN, Israel consistently refused American and British requests to adhere to the treaty. Israel did so with impunity. Israel's obduracy facilitated its nuclear programme. Especially after India's 1974 test, which re-energised American anti-proliferation efforts, the US focused on critical non-NPT countries having few friends in American politics. Apart from periodic media revelations, there was a lack of attention to Israel's nuclear activities in American public policy and among foreign policy elites and anti-nuclear lobbies; this condition shielded Israel from criticism to the benefit of its nuclear evolution.

According to subsequent CIA-inspired reports, Israel assembled nuclear weapons during a tight corner of the 1973 war. Arguably, Israel's nuclear weapons limited Egyptian and Syrian military behaviour. The conflict produced Soviet and American nuclear alerts, only the second case of its kind. A missed opportunity, the Nixon post-war diplomacy did not include full-scope safeguard requirements in draft accords overseen by Secretary of State Henry A Kissinger which covered possible sales of safeguarded reactors to Egypt and Israel. In the Israeli instance the absence was consistent with Kissinger's judgment in 1966 that ultimately Israel has to depend on nuclear deterrence.⁴ No Western public figure is known to have made a similar comment about Arab nations.

⁴ Sholomo Aronson, *Conflict and Bargaining in the Middle East* Baltimore: Johns Hopkins University Press, 1978, p 397.

The imbalanced, if not distorted, Camp David settlement following the Egyptian and Israeli peace moves increased Israeli geopolitical advantages, which Prime Minister Menachem Begin quickly exploited, increasing the bitterness of rejectionists. Rebuilding with borrowed power, Israel secured the demilitarisation of the Sinai which was funded and policed by Americans and increased its hold on the Occupied Territories against the wishes of Jimmy Carter and PLO objections. Begin's Israel mounted a power advantage over re-supplied Syrian and PLO forces and more distant adversaries which later burst northward in the Lebanese invasion. Pre-Osiraq, there was less need than ever to adopt the 'bomb-on-the-table' policy advocated by Moshe Dayan concerned about Arab numbers.

Maintaining and improving the covert nuclear arsenal was in order as Israel recovered from the 1973 shock and losses. Israel may have been a party to the mysterious signal over the South Atlantic in September 1979. Contrary to an American presidential panel, which did not wait for a full study, some analysts held that the signal was a nuclear test, not a natural event. Some observers believed that the test may well have been conducted by Israel or South Africa, or both; if so the exercise violated the Limited Test Ban Treaty ratified by both states.

The episode gave socialist and non-aligned states additional reasons to lead the adoption (over Western objections) of General Assembly resolutions calling upon Israel and South Africa to open all of their nuclear facilities to IAEA inspections and military and nuclear suppliers to cease transfers to the two states. Although South Africa may have been affected slightly by pressures regarding military and nuclear sales, the demands had no impact on the full-scope safeguards issue for either 'pariah' state. American military exports to Israel persisted. Israel's public nuclear imports had ended earlier. The emergence of the US Nuclear Non-Proliferation Act of 1978 rules out American sales of reactors or fuel to non-NPT states, unless they accepted full-scope safeguards.

Another approach to non-proliferation is the free-zone.⁵ In 1974-9 only Israel abstained on General Assembly votes favouring resolutions proposing Middle East military denuclearisation through non-proliferation pledges followed by submission of all nuclear facilities to IAEA scrutiny. Keeping its distance from this formula, Israel had its

⁵ Paul F Power, 'Preventing nuclear conflict in the Middle East: the free-zone strategy', *The Middle East Journal* (37) Autumn 1983, pp 617-35.

own free-zone line. In 1974 Israel proposed a Middle Eastern conference to draft a multilateral treaty modelled after the Tlateloco Treaty authorising a Latin American free-zone. Welcomed by Western states, the proposal was not tied to a settlement of other Arab-Israeli issues and as such represented a change in Israeli policy. But working with, and thus accepting, Israel while other major problems were outstanding was not to Arab liking; hence, the proposal got nowhere. Conceivably, all Middle East free-zone resolutions were meant chiefly to embarrass the other side, not to produce military denuclearisation. Israel stood the most to lose militarily by the implementation of any free-zone formula.

Pre-Osiraq, the non-proliferation regime could not or would not take steps to deal with Israel's 'bomb-in-the-basement' apart from what has been reported above. NPT Review Conferences issued general appeals to non-NPT states to adhere; but none of the critical nations (Argentina, Brazil, India, Israel, Pakistan and South Africa) did so. As to Israel, it was not only an instance of a dynamic and resilient state having a close superpower friend. Israel also represented something not peculiar to itself or the Middle East or clients of the US, namely, the national use of covert or nearly covert means to provide for its defence under the theory of sovereignty which international relations continued to uphold.

Israeli perceptions and policies towards Iraqi nuclear activities

The tap root of the Osiraq strike was the perception of Israeli Labour and Likud-led coalition governments that Iraq's emerging nuclear activities would sooner or later conflict with Israel's Middle Eastern nuclear-bomb monopoly. The monopoly provided the Jewish state with unique regional defensive or offensive weapons and bargaining leverage with the US and perhaps other nations. Perforce, the Rabin Government of 1974-7 and the Begin Government beginning in May 1977 did not ventilate their basic objections to Iraqi nuclear developments with reference to Israeli capabilities; rather, they portrayed the fundamental issue as one of an alleged Iraqi search for nuclear weapons as an integral part of an Iraq's putative ambition to use any military means to defeat Israel and to unmake the 'Zionist entity'. That the Baghdad regime was engaged in such a quest and had the intentions attributed to it cannot be proven or disproven.

Clearly, Iraq was in a state of war with Israel and through support to

Palestinian forces and diplomatic and propaganda efforts represented itself as a leading opponent of Israel. To some major degree, Iraq's anti-Israeli stance and conduct were meant to try to offset its Arab arch-rival, Syria, and impress the Arab world. Part of the pan-Arab effort was to alert Arab states to the possibility that Israel might use nuclear arms in a fifth Arab-Israeli war; it was this message which Iraq delivered to the Arab League meeting of 1977, thereby giving Israel and others slight evidence to support charges that Baghdad was going for the Bomb and would use it against Israel.

Another part of Iraq's Middle Eastern ambition was to become the dominant Gulf power. This vainglorious policy led Iraq to start a massively costly war with an Iran much less weak than Iraq had supposed. Post-Osiraq, Iraq employed chemical weapons against Iran in violation of Iraqi ratification of the Geneva Protocol. Thereby, Iraq opened the door to critics to apply retroactively Iraq's violative conduct to its alleged nuclear bomb intentions. Thus critics claimed that Iraq would not have hesitated to violate non-proliferation norms to use nuclear weapons, if they could have been acquired, against Israel or Iran. The logic of such claims is too convoluted to be accepted.

Iraq's nuclear conduct did prove that it planned to go well beyond its possession of a small Soviet-provided research reactor and use its oil wealth and supply leverage with willing France and Italy to create an advanced nuclear complex at Tuwaitha. Although Iraq had military and political ties to the Soviet Union, it declined to further Iraq nuclear ambitions. Tuwaitha's ostensible purpose was to engage in peaceful nuclear activities for the sake of Iraqi and Arab development. All this was to be done under IAEA safeguards required by the NPT, which Iraq had ratified in 1969.

In 1975 and 1980 Iraqi's leader, Saddam Hussein, or his regime's media made ambiguous statements about Iraqi nuclear ambitions which can be interpreted either as confidence-building euphoria or evidence for Iraqi intentions to use Osiraq eventually to produce nuclear arms.⁶ Even in the latter case, one might judge that bilateral nuclear deterrence, not nuclear strikes, was Iraq's goal. But Israel's nuclear bomb monopoly perspective did not accept any nuclear balance of terror on the superpower model between Israel and an adversarial state.

Beginning in late 1974, at the first signs of Iraq's nuclear diplomacy with France which was launched in the wake of the oil supply crisis,

⁶ Spector, *The New Nuclear Nations* (1985), *op. cit.*, pp 165-6.

Israel's strong representations with France and the United States focused on a 1975 France–Iraqi agreement. The accord provided for the transfer of a large (40 MW, but not 70 MW as Israel sources claimed) Material Testing Reactor of the kind typically used by advanced industrial nations capable of manufacturing power reactors. Worth about \$275 million and related to arms and oil trade, the package included highly enriched uranium fuel, together with construction, training and follow-through assistance. Based on a French model, Osiraq was sold instead of a gas graphite power reactor having a greater plutonium producing capacity which the Giscard–Chirac government had declined to provide. Not a NPT party, but pledged to act like one, France was also engaged in the 1970s (much to American regret) in proliferation sensitive nuclear export dealings with non-NPT Pakistan and NPT South Korea.

Started under a Labour administration, Israeli objections to European sales of nuclear items to Iraq mounted with the emergence of the Begin Government in May 1977. Basic sources were Israel's likely, though unacknowledged, regional nuclear-bomb monopoly, elite unwillingness to accept any Arab proliferation capabilities, Begin's projections of his Holocaust traumas on to Saddam Hussein and the Likud Coalition's militancy.

The Israeli regime's case against European suppliers and Iraq purchases, which were not violations of non-proliferation rules, asserted that the sold and eventually transferred nuclear items were well in excess of the needs of a country in an early nuclear stage.⁷ Osiraq was said to be appropriate only for states capable of producing nuclear power reactors. Osiraq's highly enriched fuel had proliferation risks. Israel also objected to Italy's sale of laboratories unsuited to 'hot' operations, though capable of being upgraded to do plutonium separation work. Another object of criticism was Iraq's purchase of uranium from Brazil, Italy, Niger and Portugal. Theoretically, the ore could have been used for proliferation ends.

In 1983 specialists appointed by the United Nations Secretary-General concluded in their study that detection of highly enriched fuel

⁷ *The Iraqi Nuclear Threat—Why Israel Had to Act*, Jerusalem: Ministry of Foreign Affairs and Atomic Energy Commission, 1981. Some parts of the Israeli case were ventilated before the strike. Antipodal to Israel's case, an expert study of the Osiraq raid and related issues which was submitted to the United Nations Secretary General in October 1983 held, *inter alia*, that the strike had violated the non-proliferation regime, caused a profound setback to Iraq's peaceful nuclear development and weakened restraints on preventive attacks against nuclear facilities. See A/38/337.

from Osiraq would not have been difficult and that under normal conditions the reactor would have produced virtually no plutonium. The study held that under a worst case scenario only approximately two kilograms of plutonium would have been produced annually, while eight kilograms are needed to conduct a nuclear explosion. It was said that the laboratories had *bona fide* research purposes; IAEA safeguards would have followed the introduction of material into the laboratories.

Troubling to Israel and independent observers were Iraq's unsuccessful efforts in 1980–81 to obtain depleted-uranium-metal-fuel pins, a heavy-water power reactor and a reprocessing unit from Western sources. (There were post-raid reports of a 1982 Iraqi interest in probably non-existent plutonium offered by Italian smugglers in what may have been an effort to entrap Baghdad.) Iraq's actual or attempted nuclear purchases built up circumstantial evidence of proliferation intentions.

Before and after the raid, the Begin Government stressed that the nuclear transfers represented threats to Israel because of the allegedly irrational nature of Saddam Hussein, who was held to be without scruples within and outside of his country. Clearly, Israel denigrated the capability of the NPT-IAEA to safeguard Osiraq against proliferation misuse by Hussein.

The US was aligned with parts of the Israeli charges. But it is unclear how much Washington did about the Israeli allegations against Iraq and its suppliers. American diplomatic aid to Israel may have been limited by Iraq's compliance with the NPT and IAEA safeguards, the international legality of the sales, United States ties to France and Italy, an interest in not antagonising Iraq and doubts about Israel's reading of Saddam Hussein's intentions.

A conjectural argument can be made that Israel was the United States' proxy. Two matters may be cited. In October 1980, the same month of Israel's decision to strike Osiraq, Israeli specialists consulted at their request with staff members of the United States Nuclear Regulatory Commission about the likely results of a hypothetical hitting of an unidentified nuclear plant by 2,000 lb bombs, the kind the Israeli Air Force subsequently used against Osiraq.⁸ In a post-raid outburst against American condemnation of the Osiraq strike, Begin claimed that the United States had provided him with unsettling intelligence on Osiraq which he had used in making his decision. The Reagan

⁸ *The Washington Post*, 19 June 1981.

Administration was not pleased with this revelation. Still, the US seems to have been genuinely surprised by the raid, and not only by its timing.

Subjected to negative American, Israeli, and Syrian pressures regarding the proposed sale of the highly enriched uranium fuel to Iraq, the French government attempted but failed to secure Iraq's consent to accept low-enriched fuel. Iraq did accept some major technical and staffing measures to strengthen non-proliferation. For Israel's part, it may have authorised the use of violence in 1979 and 1980 resulting in property damage and loss of life to try to stop Osiraq's completion in France and Italian provision of the laboratories.

All means failed to prevent the export and installation of the nuclear items; the completion of Osiraq proceeded under French supervision. The IAEA certified Osiraq in June 1980. After an Iranian air attack in September 1980 caused minor damage to the reactor and a delay in the inspection schedule, another IAEA inspection the following January found no evidence of diversion of materials. But by then the Israeli government had already decided to destroy the reactor by military force.

There was time for a peace line in the form of an Israeli revision of its free-zone stance in the United Nations General Assembly. In November 1980, Israel changed policy and supported the standard free-zone resolution proposed by Egypt. Israel's vote made possible a world consensus on a free-zone formula for the Middle East. The shift appears to have been motivated by Israeli interests in a) projecting a peaceful profile at a time when Israel was vigorously objecting to Iraqi nuclear events; and b) laying the ground-work for an Israeli counter to unfavourable world opinion expected to be generated by the execution of the secret decision made the previous month to strike Osiraq. The execution was put off in deference to the American elections and governmental transition in Washington.

The opportunistic nature of Israel's vote for the NPT free-zone resolution in late 1980 was evident in Israeli positions taken at the time. Israel indicated that it had no intention of implementing the resolution's call for non-proliferation pledges and movement toward NPT adherence, which would require Israel to accept full-scope safeguards. Attempting to discredit the NPT system, Israel claimed that Iraq had been exploiting the respectability of NPT adherence and accompanying safeguards applied by the IAEA over declared facilities at Tuwaitha while pursuing proliferation goals. Israel claimed also that many Arab states could interpret their present or future NPT adherence

is not applicable to their relations with Israel, because they regarded themselves to be at war with Israel.

Indicative of Israel's desire to appear constructive, during the 1980 JN session Israel introduced a draft resolution re-proposing the Latin American free-zone model for the Middle East which Israel had suggested six years before. Based on a restatement of the Israeli free-zone policy announced in the Knesset on 30 July 1980, the resolution carried no preconditions for holding a multilateral free-zone conference. After receiving favourable Western reactions and negative Arab responses, the resolution was withdrawn.

At about the time of this exercise, what were Israel's pre-strike nuclear forces, which Israel was determined to keep unchallenged in the region? Taken sometime in 1980 and reliably reported in early 1981, an American intelligence analysis indicated that Israel had as many as 200 nuclear weapons fully assembled and with the same number of varied delivery systems.⁹ Israel had come a long way since the early 1960s. The arsenal was a substantial military resource to be kept free of any Arab competition and undeterred by any possible regional balance of nuclear terror.

At the end of 1980, the opposition Labour leader, Shimon Peres, was invited to the Prime Minister's office and told by Menachem Begin of his great concern about Osiraq.¹⁰ There was no discussion. Subsequently learning of the October 1980 strike decision and leading in polls for a forthcoming general election, Peres wrote to Begin in May and asked him 'not to do it and certainly not under these conditions and timing.'¹¹ A friend of the newly elected French President, François Mitterrand, who was known to be more sensitive to Israel than his predecessor, Peres wrote that 'Materials can be changed with another material . . . but what we want to prevent can be hastened.' Furious about Peres' knowledge of the strike decision and rejecting the advice, Begin set up a small group to select an attack date.

The Osiraq raid and its immediate aftermath

World attention was drawn to Middle East nuclear issues when the Israeli Air Force, using American-built F-15s and F-16s, overflew Saudi

⁹ *Foreign Report*, 1981, *op. cit.*

¹⁰ Perlmutter, *op. cit.*, 1982, p. 39.

¹¹ *Ibid.*, p. 40, citing *Haaretz*, 9 June 1981.

Arabia and Jordan and destroyed Osiraq, then under construction, on June 1981.¹² There was a report that the destruction was actually caused by Israeli agents on the ground, so as to coincide with the aerial attack;¹³ but this report has not been corroborated. Causing two deaths, the planes returned safely to a heroes' welcome.

Justifying a world 'first' in the name of 'supreme national interest' Prime Minister Begin offered a battery of notions in anticipation of or in response to external criticisms. *Inter alia*, the Israeli leader asserted that Iraq intended to proliferate beneath allegedly illusory IAEA inspection and use nuclear weapons against Israel, *regardless of the consequences to Iraq*. Some press citations offered by Begin as evidence of Iraq's intentions were authenticated, while others were not. Begin incorrectly charged that Osiraq had a 'bomb-chamber'.

The Prime Minister asserted that the non-proliferation regime and European suppliers manipulated by oil-exporting Iraq had grossly neglected their responsibilities, thereby endangering Israeli security. Expressing a humanitarian concern for Iraqis, as well as his own people, Begin said that the attack was timed before Osiraq went critical in order to avoid causing deaths in Baghdad. This statement did not withstand technical scrutiny. The leader denied that the strike was timed to influence elections in Israel. Begin held that some Arab states secretly appreciated Israel's action as a check to Iraqi ambitions.

Virtually all regimes and leading press editorials world-wide strongly condemned Israel's attack as an act of aggression creating a destabilising precedent for anti-proliferation. West European, Soviet and Third World opinion was sharply negative. Having met Begin only two days before the raid, Egypt's President Anwar Sadat was particularly disturbed. The strike was highly popular in Israel. American reactions varied. Some members of Congress defended Israel's action and faulted the non-proliferation regime, European suppliers and Iraq. Other Congressmen worried about 'vigilante tactics

¹² Sometimes conflicting or at least varying evaluations of the Osiraq raid, Iraq's nuclear plans or the adequacy of Osiraq safeguards are found in Shai Feldman, 'The bombing of Osiraq revisited', *International Security* (7) Fall 1982, pp 114-42; H Gruemm, 'Safeguards and Tamuz', *IAEA Bulletin* (23) December 1981, pp 110-14; Istavan Pogany, 'The destruction of Osiraq: A legal perspective', *The World Today*, (37) November 1981, pp 413-18; and Charles N Vai Doren, 'Iraq, Israel and the Middle East proliferation problem', a report prepared for the Arms Control Association, Washington DC, 1982. The Begin government's views are found in *The Iraqi Nuclear Threat—Why Israel Had to Act*, op. cit., 1981. Criticisms of Israel's action are found in *Arab Perspectives*, special issue (July 1981). There were several US Congressional hearings on the Osiraq raid.

¹³ *The Sunday Times* (London) 11 October 1981.

and wider questions of precedent, Israel's self-help and Middle Eastern peace. Congressional hearings tended to be dominated by Israeli apologists and a former IAEA inspector's testimony on the inadequacies of IAEA safeguards and Iraq's alleged bomb intentions.

Among non-partisan specialists, no consensus developed about Iraqi intentions or proliferation techniques which Iraq might conceivably have attempted. A former US Arms Control and Disarmament Agency official held that there was a high probability that any presumed Iraqi efforts to secure bomb-grade materials would have been detected by IAEA inspectors or French technicians contracted to be in Tuwaitha until 1989.¹⁴

Condemning the raid, President Ronald Reagan also expressed understanding for Israel's concerns stemming from Iraq's refusal to sign a cease-fire with or to recognise Israel. Although Washington had had pre-raid concerns about Tuwaitha expressed in exchanges with Israel and efforts to prevent or moderate French and Italian transfers, Department of State officials held after the strike that the US had no evidence that Iraq had violated or was violating the NPT or IAEA safeguards. The Administration denied that the United States had been consulted about the raid or informed about it in advance, thereby implicitly rejecting Soviet innuendos to the contrary. The Executive Branch indicated that it was disturbed that Israel had not exhausted diplomatic remedies and that the attack had damaged the Habib mission and other American peace efforts.

In the United Nations Security Council the United States joined with outraged, but also prudent, Iraq to reach agreement on a condemnatory, non-punitive resolution. Taking notice that the IAEA had found that its safeguards had been satisfactorily applied to Tuwaitha, the unanimously adopted Resolution 487 of 10 June 1981, (1) strongly condemned Israel's attack as a violation of the United Nations Charter; (2) called upon Israel not to repeat its conduct; (3) held that the attack was a threat to the IAEA-NPT regimes; (4) recognised the right of all states to pursue peaceful nuclear development consistent with non-proliferation; (5) called upon Israel to submit its nuclear facilities to IAEA safeguards; and (6) held that Iraq was entitled to redress, which it did not seek in order to avoid dealing with its adversary.

Having spared Israel an arms embargo, American policy in the

¹⁴ Van Doren, 'Iraq, Israel and the Middle East proliferation problem' 1981. *op. cit.*

Security Council was explained by Ambassador Jeanne J Kirkpatrick as being based solely on Israel's failure to exhaust diplomatic resource and having no deleterious impact on American support of Israel's security. To demonstrate symbolic disapproval of Israel's conduct Washington imposed short-lived delays in the delivery of aircraft to Israel and began a study of whether Israel's use of American-supplied aircraft had violated United States law. Raising questions about Executive sincerity, if nothing else, the study was never completed. A positive finding would have obliged the United States to end the arm transfers to Israel, which were not diminished.

Against the world, Israel denounced Resolution 487 and defended its self-help conduct as legal, moral, vitally necessary and a service to non-proliferation.¹⁵ Israel's standing in American opinion declined because of Executive Branch disapproval and Security Council censure of the Osiraq raid, thereby increasing difficulties for Mr Begin's post-raid visit to the United States and aiding successful Reagan Administration efforts to sell AWACs to Saudi Arabia over the strenuous opposition of Israel's Congressional partisans. But in the Middle East Israel was not restrained by the bombing episode and eroded American support. Following the June 1981 election, which kept the Likud-led coalition in power by a slim margin, the Begin Government rode out American regime criticism of Israel's massive strike on Beirut.

Entangled in a costly war with Iran, Iraq responded only in verbal and diplomatic ways to the Osiraq attack. In addition to recriminations Saddam Hussein invited states opposed to the aggression and supportive of mutual nuclear deterrence to keep the peace to assist Arabs to obtain weapons to check Israel's threatening nuclear arms. Smarting from Western judgements that this statement demonstrated his proliferation intentions, Hussein said that he had only wished to call attention to the danger posed by Israel's possession of nuclear arms and he repeated his assurances that Tuwaitha was dedicated to peaceful ends.

Pledging to replace Osiraq, the Iraqi leader received a funding promise from Saudi Arabia and supplier encouragement from France. Importantly, France said that low-risk 'caramel' fuel would be substituted for the highly enriched uranium fuel which had been partially shipped to Tuwaitha. Anti-proliferationists may be concerned

¹⁵ The UN should reimburse Israel for the costs of its anti-proliferation contribution, according to the *Jewish Advocate* (London) 2 July 1981.

about the 12.5 kilograms of fuel which is still at Tuwaitha. Domestic and external pressures on Iraq would seem to be too great to allow any proliferation diversion of this fuel, which is still subject to IAEA oversight.

Of all the issues raised by the Osiraq raid, the Begin preventive strike doctrine may be the most significant psychologically and strategically. Immediately after the attack, the Israeli leader declared that the strike meant that Israel would not tolerate any 'enemy' whether 'Arab or non-Arab', acquiring nuclear weapon capability, as well as an actual bomb programme. The 'any enemy' formulation was meant to include, not only Libya, but also non-NPT Pakistan, based on its unsafeguarded enrichment and re-processing activities and its reported interest in producing nuclear explosives. Before the raid, Israel had warned of Pakistan's suspected nuclear bomb plans. The 'capability' provision was intended to cover virtually any nuclear programme with sensitive materials, even if subject to IAEA safeguards, such as Osiraq had.

Nowhere in the Begin pronouncement was any respect shown for the NPT or IAEA safeguards. Israel alone would determine which nuclear operations 'threatened' Israel. Security Council Resolution 487 asked Israel not to repeat its conduct, but it did not ask Israel to withdraw its preventive strike doctrine. The withdrawal question impelled several nations to pursue the question in other international organisations.

Osiraq issues five years on

In some respects, major issues raised by the Osiraq episode have not withstood the traumas of the attack, the passage of time or the weight of evolving politics. Other leading questions have persisted in the same or modified forms which they had in mid-1981. Influencing all questions have been background forces operating before the preventive strike, notably, Israel's regional nuclear-bomb monopoly and rejection of mutual deterrence, Arab nuclear underdevelopment, an imperfect non-proliferation regime and United States indulgence and subsidy of Israeli behaviour.

Although Security Council Resolution 487 reaffirmed the right of all states to pursue peaceful nuclear development consistent with non-proliferation, Iraq had not replaced Osiraq nor secured any nuclear equipment or materials for Tuwaitha by late 1985. In early 1984 Iraq announced that the Soviet Union would supply a safeguarded power

reactor. Based on historic Soviet practices, the reactor, if it materialises, would add an anti-proliferation presence in Iraq.

As to European suppliers, France indicated in 1982 that, in addition to an insistence on 'caramel' fuel from any possible replacement for Osiraq, Iraq should secure a wide Arab involvement in Tuwaitha. As of December 1985, there were no firm indicators that Iraq had accepted these requirements or, indeed, that France was actively interested in a renewed supply role. Concern for domestic and international political repercussions and a vastly improved oil supply may have diminished French interest.

French and Iraqi fear of another Israeli strike may have minimised nuclear activism. Possibly aided by an American later arrested on charges of spying for Israel,¹⁶ the 1 October 1985 Israeli raid on the PLO's Tunis headquarters reminded observers of Israel's retaliatory power. Although Baghdad and Paris have settled their accounts on the destroyed Osiraq, the financing of a replacement may be a leading problem in a period of low-Iraqi oil exports and depressed oil prices. Last but not least, Iraq has a vital stake in ending the Iraqi-Iranian war costing approximately one million lives and vast sums. Against this stake, nuclear energy must have a lower priority. An issue in the 1985 NPT Review Conference, Iraqi attacks on an Iranian reactor site in 1984 and 1985 injured Baghdad's case against the Osiraq bombing.

The resumption of full American-Iraqi relations in November 1984 may hold out some hope for a revived nuclear future for Iraq. In an American perspective, the costs of such a revival are likely to be Iraq's acceptance of increased IAEA controls and recognition of Israel's right to co-exist peacefully with other nations. Although a post-raid Hussein comment to an American Congressman acknowledged Israel's need for security, Iraq's reported favours for Abu Abbas of *Achille Lauro* fame suggests that the Hussein regime has not yet moved to where it might abandon a confrontation posture in return for Western favours. Political change is always possible.

The Arab world's potential for securing nuclear arms was dealt a devastating blow by Israel's self-help. If one assumes that Iraq had proliferation goals, there is no foreseeable alternative to fill Iraq's place.¹⁷ Subject to active external and domestic opposition to the

¹⁶ *The Chicago Tribune*, 4 December 1985

¹⁷ There is an 'Islamic Bomb' scenario in which Pakistan develops nuclear weapons and provides them to Libya or some other state within the strict Middle East confines. If Pakistan acquire nuclear arms, it is highly unlikely that national interest and external factors would result in any 'passing' of the Bomb; it would be 'Islamic' in the sense that Z A Bhutto envisaged.

Qaddafi regime, as well as to NPT control and Soviet anti-proliferation, Libya offers an unlikely basis for a nuclear-bomb future. For some of the same and different reasons, the point holds also for Iran. Promised a Soviet-built power reactor, NPT Syria is not a likely proliferation candidate. Non-NPT Algeria may conceivably acquire a nuclear status in the long run, but probably only through NPT adherence, and therefore, one assumes, in a strictly peaceful mode. NPT Egypt is showing the way to a peaceful, but limited nuclear future for Arab states.

What can be said of the non-proliferation regime's responses to the Osiraq assault on its integrity? The 'have' NPT architects, Britain, the Soviet Union and the US, spoke through Security Council Resolution 487. Britain, France and the US had opposed mandatory sanctions against Israel. No further Security Council consideration of the Osiraq affair emerged. Bilaterally, the US asked Israel (with no success) to adhere to the NPT; as in the past, Washington applied no special pressure.

Bristling at world censure, Prime Minister Begin said in late June 1981 that Israel would open all of its nuclear operations to inspection only when the Arabs made peace with Israel. This declaration appeared to end Israel's unconditional approach to a free-zone conference. Yet in the General Assembly Israel repeated its unqualified offer to engage in a multilateral conference on a free-zone, as if nothing had happened in Middle Eastern nuclear affairs. As Israel resumed an abstentionist stance, the standard Middle East free-zone formula proposed by Egypt was adopted in every General Assembly session after the Osiraq raid.

Although the US condemned the raid, Washington became the protector of Israel from punitive steps within the IAEA, which consists of non-NPT states as well as NPT parties. Thus, only Canada and the United States voted against an IAEA Governing Board move in 1981 to recommend that the IAEA General Conference consider ending IAEA technical assistance to Israel and suspending Israel's membership rights. Among the supporters of the resolution were Japan, Mexico, the United Kingdom and Yugoslavia, all prominent NPT partisans.

In the event, the General Conference suspended technical assistance to Israel. The matter of abrogating Israel's rights to participate in the IAEA brought a struggle pitting the United States and a few other countries against many IAEA members. Compounded by Israel's invasion of Lebanon in 1982, anti-Israeli opinion in the General Conference led to its vote in September 1982 over the objections of the

United States and a few other nations to bar Israel's credentials to attend the agency's annual meeting. A protesting United States and a few others withdrew from the IAEA session and boycotted the Governing Board's meeting. The United States also began a reassessment of its IAEA participation which halted financial contributions. The ban was lifted in early 1983 when Washington expressed satisfaction that the IAEA board had taken action to meet Congressional terms to protect IAEA's participation in the agency's meetings. Not for the first time, America's funding power checked majority world opinion.

Essentially unaddressed in both IAEA and United Nations discussions of 1981-5 was the question of whether, and if so, how, to create an international regime to protect safeguarded, ie peaceful use, nuclear facilities everywhere against military attack. An issue on which Sweden has been especially active, the topic has been explored in the Conference on Disarmament within its discussion of a ban on radiological weapons. As indicated by US conduct in the Third NPT Review Conference last year, Washington is not anxious to move forward in this area.

In international organisations the focus of majority opinion remained on the Osiraq raid and Israel's threat to repeat its behaviour under appropriate conditions. Criticism of the 'Begin Doctrine' was implied by Security Council Resolution 487's call to Israel not to repeat its conduct. However, Third World and socialist nations wanted Israel to do something to admit its guilt. Israel did not oblige in response to varying anti-Begin Doctrine resolutions in the United Nations General Assembly and IAEA General Conferences. The Western and some other nations opposed these moves.

Conceivably, the United States influenced Israel to take steps to mollify world opinion and prepare the way for a possible Israeli purchase of a safeguarded nuclear power reactor. The *fait accompli* of the Osiraq raid also added its weight to produce changes in Israeli expressions of policy, if not basic policy itself. The passing of Mr Begin from the political scene and the emergence of the Peres-led Coalition in 1984 may well have been influential.

For whatever reasons, Israel took four steps in 1983-5. First, Israel narrowed the Begin Doctrine through the Arens Amendment to cover only Arab reactors dedicated to military purposes, thereby excluding non-Arab countries, notably Pakistan. Second, Israel said that it supported the IAEA when the agency remains true to its principles.

Third, Israel held that peaceful-use nuclear operations must be inviolable from military attack. Fourth, Israel affirmed that it did not have a policy of attacking, or threatening to attack, peaceful nuclear operations anywhere.

Raising questions about the credibility of Israel's new IAEA line were statements in March 1985 coming from Prime Minister Peres' Office and Cabinet member Ariel Sharon which held that Israel was prepared to attack any Iraqi reactor deemed by Israel to be a threat to Israel. In the IAEA's 1985 General Conference Israel tried to explain away these statements cited by Iraq and stressed that Iraq was covered by the new line.

Dissatisfied with Israel's modified policy, the communist and several, but not all, Third World nations continued to seek a full Israeli withdrawal of the Begin Doctrine. The goals were to secure a direct or indirect admission that the Baghdad raid was unjustified, the Osiraq safeguards were effective, Iraq was not on a bomb-path and preventive strikes on safeguard reactors were generally unjustified. A less evident objective was to embarrass the United States, the prime mover in defending Israel and holding that the Osiraq case led to an unwarranted 'politicisation' of the specialised IAEA.

The effort to achieve these goals experienced a serious setback in the 1985 IAEA General Conference. A resolution supported by all Arab states, Iran and the Eastern bloc failed to receive a necessary two-thirds majority to pass an Iraqi-sponsored resolution. The resolution called upon Israel to withdraw the Begin Doctrine, and the IAEA to withhold research and purchase agreements with Israel and refrain from scheduling meetings in Israel.

Before the vote Israel had circulated a letter enlarging upon its no-attack and no-threat statements regarding peaceful nuclear facilities and supporting any action in competent bodies to negotiate an accord protecting peaceful nuclear operations from attack or threat of attack. Importantly, the United States had pledged to quit the meeting and withhold IAEA funding, if the resolution were passed. After the failure of the punitive measure, the General Conference barely adopted a resolution sponsored by Nordic states which criticised the Osiraq bombing, considered Israel's letter as an undertaking and asked Israel to accept full-scope safeguards.

Resurfacing in the United Nations General Assembly in Autumn 1985, the Osiraq issue was the impetus for a resolution sponsored by Islamic states. The resolution held that Israel had not yet committed

itself not to attack or threaten to attack nuclear facilities, called on Israel to accept full-scale safeguards, urged all states to cease any nuclear cooperation with Israel and condemned all attacks on all peaceful-use nuclear facilities. Not subject to effective American pressures, the body passed the resolution over the objections of Western members and Israel, which had argued that its forthcoming letter to the IAEA had closed the issue. Having significance well beyond Mid-eastern conditions, the Osiraq controversy lives on in world opinion.¹⁸

We are left, then, with the issue of those countries which might possibly emulate the Osiraq raid. There are two relevant sets of nuclear rivalries involving non-NPT nations. Leading Brazil in enrichment and re-processing development, Argentina has remained, with its neighbour, outside the Latin American free-zone's effectiveness. Periodic statements from sub-presidential levels in both nations which have hinted at movement towards nuclear-bomb making capacity and the fact of unsafeguarded, sensitive nuclear facilities in the two states have troubled anti-proliferationists. Importantly, there have been no signs of inter-state tensions suggesting that military action against nuclear operations might be tempting. The joint presidential declaration of the two nations on peaceful nuclear cooperation issue in late 1985 offers reassurance that the neighbours will not divert nuclear resources to military ends.

Not true of Argentina and Brazil, India and Pakistan have ethnic, ideological, religious and territorial problems between them which have led to costly wars and recriminations. These sources have contributed to Pakistan's apparent effort to secure nuclear-weapon grade material and nuclear bomb components as a reaction to 1971 losses, India's nuclear-explosive test three years later and Pakistan's Islamic ambitions.

Bringing Indian objections, US anti-proliferation law was amended to permit American arms transfers to Pakistan in the wake of the Afghan crisis. The Zia regime's striving towards nuclear self-sufficiency through an unsafeguarded enrichment programme and other means, and reported receipt of nuclear-bomb making aid from China have

¹⁸ The topic is explored in Bennett Ramberg, 'Nuclear energy in war: the implications of Israel's reactor strike', *Working Paper* No. 34, Center for International and Strategic Affairs, University of California, Los Angeles, 1982. The Final Declaration of the Third NPT Review Conference (1985) took a sombre and cautionary stance on armed attacks on safeguarded facilities, or threats of such attacks.

vexed Western anti-proliferationists and stirred pre-emptive strike ideas in Indian opinion. Freed before the emergence of the Rajiv Gandhi Government from the impact of American nuclear export law, India has been advancing its peaceful use nuclear programmes outside IAEA safeguards. New Delhi has consistently rejected free-zone proposals for South Asia suggested by Islamabad and endorsed by the UN General Assembly on the grounds that a much wider area must be considered as the potential region of denuclearisation. The recipient of Soviet-made arms supplied on concessionary terms, India has continued to dominate the subcontinent, despite domestic security problems.

It is improbable that the Gandhi Government, one of the signatories of the Five Continents Peace Initiative urging nuclear disarmament, would emulate the Osiraq raid, even if the Zia regime, at great cost to its relations with the United States, were to be deemed to have acquired nuclear bombs. Unlike Jerusalem, New Delhi would be apt to accept a nuclear bomb neighbour, ie a regional balance of terror, which in the South Asian case would be based on a restarted or new Indian nuclear bomb programme. Brightening the South Asian picture considerably without necessarily barring proliferation futures, Prime Minister Gandhi and President Zia agreed in late 1985 not to strike at each other's nuclear facilities.

In sum, there would appear to be no situations outside the Middle East where the Israeli preventive strike is likely to be emulated. For that much the world may be thankful.

Conclusions

Iraq's known nuclear purchases centring around Osiraq and later revelations of attempted purchases from Western sources had troubling implications for non-proliferation. Israel invoked the implausible spectre of an Arab Bomb to be inflicted on Israelis, regardless of the consequences for Iraq. The spectre provided Israel with a rationale for its destruction of a reactor whose operation had not yet begun and which was under external and on-site scrutiny to detect possible diversions of weapon-grade materials. Seeking gradual improvements on a universal basis within a regime of state sovereignty, the IAEA safeguards system has slowly begun to recover from the Begin Government's damage to the IAEA's integrity and reputation.

The underlying purpose of the Tuwaitha raid was to protect Israel's regional nuclear-bomb monopoly, which rejects mutual deterrence of

the kind the nuclear giants practise. If one assumes that Iraq posed a threat to the monopoly, the purpose was realised. Contrary to the projection of some analysts, no Arab nuclear bomb effort has emerged as a consequence of the Osiraq strike, nor is such an effort even vaguely foreseeable in this century. This is the case because of a host of developmental, political and legal factors in which the non-proliferation regime plays a major role through the NPT-IAEA and an anti-proliferation ethic.

The Osiraq episode has not ushered in a new nuclear age in the Middle East. Nuclear affairs have not become intertwined with high regional politics. Under the pressure of self-interest and world opinion, Israel has whittled down the Begin Doctrine, which has not been copied elsewhere. Holding a semi-hegemonic military position *vis-à-vis* all Arab states, several of whom are adjusting to the new circumstances, Israel has serious economic problems based in part on an overweight defence budget. There are also unresolved Palestinian issues, but no united Arab front or extra-regional power to press them to the point of extracting major Israeli concessions.

In civil nuclear energy, the Middle East has not moved far in nearly five years. If political, legal and funding conditions permit, in the future Egypt, Iraq, Iran, Israel, Libya, Syria and Turkey may gain safeguarded power reactors. Israel is the only one of these countries rejecting the NPT.

Israel has considered building its own power reactor. Ironically, Israel may secure one or two safeguarded power reactors from France, the supplier of Osiraq, but, conveniently for Israel, a non-conformist on full-scope safeguards requirements. Israel has been more interested than France in such a sale. Strong objections have stemmed from NPT Egypt and Saudi Arabia, which is presumably still committed to Osiraq's replacement, and from recollections of France's aid to Israel's unsafeguarded nuclear development. Other opposing forces: American stakes in the full-scope ethic and concern that US aid to Israel might indirectly subsidise a nuclear import which Washington opposes in principle.

Favourable factors include lack of American objections to French replacement of US nuclear fuel supply to non-NPT India, Israeli lobby power in Congress, and a Carter pledge at Camp David to maintain technological parity between Egypt and Israel.¹⁹ NPT Egypt's reactor.

¹⁹ *Nuclear Engineering International* (30) July 1985, p. 15.

may be a hostage to non-NPT Israel's reactors. If the non-proliferation regime and development needs are given unbiased attention, Egypt's sale should go forward first.

There are serious financing problems for all Middle Eastern states seeking nuclear power stations. None of the civil energy reactors are apt to be as controversial as Osiraq, nor certainly as strategically important as Israel's unacknowledged nuclear-bomb arsenal.

More than one analyst sympathetic to Israel has contended that the Osiraq raid bought time for Israel before the Arabs secured nuclear arms. The only race has been solo. There is bound to be conjecture in any unclassified discussion of Israel's nuclear arsenal since Osiraq. Nonetheless, notice should be taken of a reliable report that Israel has moved to acquire nuclear-armed Jericho II missiles, low-yield aircraft deliverable nuclear bombs and nuclear artillery shells.²⁰ A non-governmental estimate of Israel's nuclear bomb strength in 1983 suggested a maximum of 31 plutonium and 10 uranium atomic bombs; warhead yields vary from 10 to 200 kilotons.²¹ *The Economist's* 'Foreign Report' citation of an American intelligence study as of 1980 referred to 200 Israeli nuclear bombs with the same number of delivery vehicles.²² However, the discrepancy between the two estimates may be explained; there is a virtual certainty that Israel's nuclear arsenal has been increasing, not declining, nor remaining static. Germane to this subject is Israel's 1985 admission, following an indictment of an American exporter, that it had received illegally exported krytrons usable in industrial applications or as nuclear bomb triggers.

We have already suggested the meaning of Israel's regional nuclear bomb monopoly for the Middle East and the status of nuclear developments in the area. Mid-decade conditions in diplomacy and military balances indicate that it is highly unlikely that in the event of another Arab-Israeli war (which cannot now be envisaged). Israel's nuclear weapons would be apt to emerge. One may hypothesise a future Arab-Israel conflict in which Arab belligerents would have active Soviet support on the model of the 1973 war.²³ It is not far fetched to

²⁰ *Aero-Space Daily*, 1 and 17 May 1985.

²¹ Pry, *Israel's Nuclear Arsenal*, op. cit., 1984, p. 111.

²² See n 4. According to this source, Israel is developing cruise missiles with the aid of Taiwan and South Africa; the missiles are to be produced in South Africa.

²³ A Soviet news agency has claimed through a report issued in Beirut that Israel had tested nuclear explosive devices in the Negev and had forty nuclear warheads and matching missiles. *The New York Times*, 26 December 1985. No other source has reported the first part of this claim.

assume that Israel would have the capacity to reach the Soviet Union with Israeli nuclear weapons.

Yet the prospects are dim that Israel would be a nuclear threat to the Soviet Union to the extent of actually deterring Moscow from supplying conventional military aid to Arab forces. For Israel to try to practise such a deterrent power would require the kind of risk-taking in relation with the Soviet Union which would endanger Israel's survival to a degree that has never been present in Arab-Israeli relations, historic to the contrary. That Israel would move ahead of the United States in confronting the Soviet Union with Israeli nuclear weapons borders on the preposterous. Any Israeli-Soviet encounter, conventional or nuclear, would greatly increase the chances of a superpower war with or without the use of nuclear arms.

Conceivably, a future Israeli government might decide that its national interest would best be served by a radical cutback in Israel's undeclared nuclear arsenal under the general condition of widespread Middle Eastern political and legal acceptance of Israel's sovereign existence and military predominance in the region. The reduction would not be accompanied by what appears to be impossible, namely Israel's adherence to the non-proliferation regime through the NPT or nuclear weapon-free-zone.

This nuclear cutback scenario is unlikely ever to occur. Contrary factors include the heady experience of possessing nuclear arms, the influence of the military on Israeli politics, the relative economic and political cheapness of nuclear versus conventional weapons in all 'have' nations, and the 'strategic-ally' notion projected by American and Israeli politicians. What remains, therefore, is a picture of an Israeli 'bomb-in-the-basement' persisting in the long run. At the same time, Israel is not likely to have any major incentives for 'going public' in a world increasingly dedicated to horizontal and vertical non-proliferation.

Economic consequences of the Iraq–Iran war*

The Iraq–Iran war which has been going on for nearly six years will perhaps go down in history as one of the costliest conflicts in this century. It is estimated that the first five years of the fighting may have resulted in a toll of war dead approaching one million.¹ The economic cost of the conflict which may have already exceeded \$500 billion is also staggering in terms of its impact on and implications for the economies of the two nations.

Following a brief survey of economic conditions prior to the war in both countries, this essay will attempt to deal with three separate but interrelated issues: first, the effects of the war on the Iraqi and Iranian economies, second, the impact of the war on, and the role of Saudi Arabia in, the changing relative positions of Iraq, Iran and Saudi Arabia itself in the international oil market and third, an assessment of the prospects for economic development in the post-war period.

Economic conditions before the war

Iran

In Iran the period between 1973 (the year of the oil price revolution) and 1977 (the last full year prior to the events of the Iranian Revolution) was marked by an accelerated level of public spending which was made possible by the sharp increase in oil revenue. Development spending however was both mismanaged and disorganised giving rise to a number of serious structural problems including a high level of inflation, accentuated maldistribution of income, high levels of imports of both military and non-military goods, concentration of civilian spending

* I would like to thank James David Sweeny for his constructive comments.

¹ The literature on the causes of the war and the historical developments which led to it is voluminous. For a detailed treatment of relations between Iraq and Iran see J M Abdulghani, *Iraq and Iran: The Years of Crisis*, Baltimore: Johns Hopkins University Press, 1985, especially ch. 8. See also Phebe Marr, *The Modern History of Iraq*, Boulder: Westview Press, 1985, ch. 10. For a comprehensive analysis of the war, see Robert C Johansen and Michael G Renner, 'Limiting conflict in the Gulf', *Third World Quarterly* 7(4) October 1985, pp 803–38. For casualty figures, see *The New York Times*, 23 September 1985.

in urban centres especially the capital city of Tehran, and the concentration of economic power and benefits in the hands of a few families. The consumer price index rose from 6.5 per cent per annum in 1972 to 11.3 per cent in 1976 and resulted in the deterioration in the real income and living standards of those who depended for their livelihood on wages and salaries as such earnings failed to keep up with rising inflation. In order to stem the impact of inflation and to attempt to stabilise the economy the government decided in 1977 to create a recession by reducing public spending. The effects of this policy were exacerbated by the general economic stagnation in industrialised countries. The combination of these changes succeeded in reversing an average growth rate of gross domestic product (GDP) of 11 per cent per year for the period 1966–75 to a 2.1 per cent decline in 1977 to be followed by another decline of 5.3 per cent in 1978. This drastic decline in GDP failed, however, to control inflation which increased at an annual rate of 27.3 per cent in 1977 and another 11.6 per cent in 1978.² The economic recession and inflation succeeded however, in accelerating the pace of the political upheaval which was beginning to engulf Iran in 1977 and which continued into 1978. It was obvious by the second half of 1978 that the days of the monarchy were numbered. This was underscored by the national strike, industrial unrest, the oil workers' strike, and the general civil disobedience movement. It was in those months when the Shah attempted to salvage his regime by changing cabinets and prime ministers.³

The departure of the Shah, the collapse of his armed forces and the demise of the last Shah-appointed government of Shahpur Bakhtiar paved the way for the first cabinet in the newly established Islamic Republic of Iran headed by Prime Minister Mehdi Bazargan. Needless to say, the new regime hoped for a rapid economic recovery. But the damage which the economy suffered toward the end of the Shah's regime and the inevitable economic dislocation and disorganisation which characterise any revolutionary period made the hoped-for economic recovery an unrealistic goal. Among the many reasons for the failure of the recovery one must include the withdrawal of large

² International Monetary Fund, *International Financial Statistics: Supplement on Output Statistics*, Washington DC, 1984, pp 14–15.

³ For a review of the events which preceded the establishment of the new republic in Iran see Dilip Hiro, *Iran Under The Ayatollahs*, London: Routledge and Kegan Paul, 1985, ch. 1, especially pp 66–100. For a good summary of current economic developments in Iran, see The Economist Intelligence Unit, *Quarterly Economic Review of Iran (QER-Iran)*.

numbers of foreign skilled workers, the flight of capital, the decision of the new government to reduce the oil output by one-third and the emigration of cadres of Iranian managers, technocrats, administrators and other skilled workers. It should also be noted that the first year of the new Republic saw a wave of rural and ethnic unrest which diverted attention and energy away from the immediate problems of the economy. Iran's GDP continued its downward trend in 1979 when it declined by 6.4 per cent while inflation continued its upward trend as it rose by 10.5 per cent in the same year.

One of the most serious developments in 1979 was the hostage crisis which had significant implications for the economy. The freezing of Iranian assets in the United States and with foreign-based US banks meant the removal of some \$9 billion out of a total of \$15 billion of assets from Iranian control.⁴ In addition to freezing Iran's assets the Carter Administration succeeded in enlisting the support of other industrial countries in imposing economic sanctions against Iran. These sanctions together with the fighting which erupted in Khuzestan in the South, and Baluchistan in the West, the continued fighting in Kurdistan and the outbreak of war with Iraq contributed to the economic decline which characterised 1980.

In spite of this gloomy picture there were some healthy economic signs. These included the fact that Iran's external financial position was good, it was able to service its foreign debts, its industry was beginning to revive and oil output was moving upward. But these positive elements were not sufficient to offset the forces responsible for economic deterioration. The contest between the secular and religious wings of the Iranian Revolution to shape the post-Shah economy and society was fierce enough to slow down economic recovery in the first year of the Revolution.⁵

Although the government of President Abol-Hassan Bani-Sadr attempted to challenge the position of the clerical groups and to introduce some reforms in the economy, the opposition to Bani-Sadr proved too strong and too entrenched to overcome.

⁴ *Ibid.*, No. 2, 1980, p 13.

⁵ In 1979 the Revolutionary Committee for Economic Policy published a nine-point programme to guide the economy in revolutionary Iran. The programme stressed godliness over prosperity; minimum output of oil; involvement of religious education as a vital part of development; self-sufficiency in agriculture and industry; adjustment of development strategy to match spiritual needs and that all citizens should have equal claims on financial resources. See *QER-Iran* (4) 1979, p 12. See also Asaf Hussain, *Islamic Iran: Revolution and Counter-Revolution*, New York: St Martin's Press, 1985, pp 150-64.

Iraq

While the Iranian economy was experiencing revolutionary upheaval, Iraq in the years following the nationalisation of the Iraq Petroleum Company in 1972 and the 1973 oil explosion was busy trying to develop its infrastructure, its oil sector and its goods producing sectors and was also attempting to modernise its military. The 1975 Algiers accords with the Shah allowed Iraq to pursue its economic development plans unhindered by the cost of attempting to put down the Kurdish rebellion. And by 1979 Iraq displaced Iran as the second largest OPEC oil producer/exporter after Saudi Arabia.

The Iranian Revolution prompted Iraq to pause and re-examine its public spending pattern and priorities after having reached the conclusion in 1979 that a conflict with Iran might prove to be unavoidable. This in turn led the government to increase spending on defence and security needs.

Although the government continued to expand defence spending in 1980, it also made another major decision—to raise development spending and rapidly to increase imports of consumer goods. Thus, between 1978 and 1979 the value of imports went up from \$4.2 billion to \$9.9 billion or by 136 per cent. These imports rose again to \$13.8 billion in 1980, or by another 39 per cent. They further climbed in 1981 to \$20.5 billion or by yet another 51 per cent. That is, Iraq's imports between 1978 and 1981 increased from \$4.2 billion to \$20.5 billion, or by close to 400 per cent.

One of the most interesting aspects of this phenomenal growth in imports was the relative increase in the share of non-military goods (Table 3). While the value of military imports rose from \$1.6 billion in 1978 to \$3.7 billion in 1981, an increase of 131 per cent, non-military imports climbed from \$2.6 billion in 1978 to \$16.8 billion in 1981, an increase of 546 per cent. Thus, the ratio of non-military goods to total imports increased from 62 per cent to 82 per cent during this period. It was suggested that this exceptional rise in non-military imports was a deliberate policy intended to cushion the impact of the war on living standards by making consumer goods available in large quantities. Iraq was pursuing a policy of guns and of butter at the same time.⁶ But such a

⁶ For an analysis of Iraq's spending policies during the early phase of the war, see John Townsend, 'Economic and political implications of the war: the economic consequences for the participants', in M S El Azhary (ed), *Iran-Iraq War: An Historical, Economic and Political Analysis*, New York: St Martin's Press, 1984, pp 51-65.

policy could not be maintained for long and it had to be revised in 1981 under the impact of the war.

The economic effects of the war

The Gulf War is not different from other wars in terms of its cost to the combatants. In addition to the human cost there are also economic costs in the form of the destruction of assets and infrastructure, domestic inflation, inflated prices of imports, lost output due to the mobilisation of the labour force away from the civilian sector in favour of the military economy, lost oil revenue and the general economic deterioration associated with the war. In the following paragraphs the focus will be on the economic losses which were sustained by both countries in the early phases. This will be followed by an analysis of the effects of the war on each country separately.

Oil: the first economic casualty

One of the early and most visible economic casualties of the war was the mutual destruction by Iran and Iraq of the most important and the most necessary sector of each other's economies—the oil sector. Within days of the outbreak of the war both countries succeeded in putting each other's oil-exporting capabilities out of operation including loading facilities, pumping stations, refineries, terminals and pipelines. The extent of the damage is reflected in the fact that both countries were reduced to a small fraction of their pre-war output. In the case of Iraq, its output declined from 3.4 million barrels per day (b/d) in August to a mere 140,000 b/d in October. Iran's output declined from 1.3 million b/d to 450,000 b/d during the same period.⁷

▶ The loss of oil exporting capacity in both countries was by far the most devastating economic blow of the war. This is so because oil had become since 1973, and more so after the 1979–80 price increases, the most important sector of the economy in terms of its contribution to GNP and as the main source of foreign exchange. In Iraq oil revenues had peaked in 1980 to \$26.1 billion and constituted 66 per cent of GNP. In the case of Iran oil revenues peaked in 1979 at \$20.5 billion or 29 per cent of GNP but declined in 1980 to \$13.5 billion or 18 per cent of GNP. And in both

7 For a detailed account of the impact of the war on the operations of the oil sector in both countries, see Thomas R Stauffer, 'Economic warfare in the Gulf', *American-Arab Affairs* (14) Fall 1985, pp 98–116.

countries oil sales were almost the sole source of foreign exchange earnings. Therefore, the war-caused reduction in oil revenue had a significant impact on the entire economy. Thus in 1981 Iraq's oil revenue which was cut to \$10.4 billion or by 60 per cent caused a decline of 24 per cent in GNP, from \$39.7 billion to \$30.1 billion. In Iraq, however, since the war-related loss in oil revenue was only \$4.2 billion or 31 per cent of the 1980 level and since the contribution of the oil sector to the Iranian economy is much smaller than that of Iraq, the impact of the loss in revenue on the GNP was much less severe (Table 1).

In addition to the immediate loss of oil income there were other economic costs which were incurred by the two countries because of the war. One such loss was the forced re-routing of imports to alternative and more costly routes. Iraq for instance, due to the closure of its ports had to find new overland routes through Kuwait, Jordan and Turkey. Similarly Iran found it necessary to divert some of its trade from its ports on the Gulf to routes going through the Soviet Union and Turkey. Such re-routing had the effect of raising the delivered prices of foreign goods due to higher transportation costs.

Moreover, the diversion of resources to meet the needs of the war

Minor adjustments were made to reconcile data from different sources.

forced both countries to increase their dependence on foreign suppliers. Another effect of the war was the rapid decline in foreign reserves which forced the two countries (especially Iraq) to resort to foreign borrowing.

The war and the Iraqi economy

When the war broke out Iraq found itself, as was indicated earlier, in the enviable position of being able to increase defence spending and development spending as well as expand its imports of non-military goods. Iraq, unlike Iran, suffered neither from domestic political dissension nor from diplomatic isolation or economic sanctions. Iraq's considerable foreign reserves on the eve of the war coupled with the generous flow of financial support from other Arab countries, particularly Saudi Arabia and Kuwait, made it possible for the government to pursue the policy of 'guns and butter' alluded to earlier. The significance of such a policy may be appreciated when it is realised that the value of Iraq's contracts with foreign enterprises for non-military projects increased between 1980 and 1981 by 64 per cent, from \$14.8 billion to \$24.3 billion.⁸

Similarly, non-military imports were increased sharply during the first two years of the war, from \$11.9 billion in 1980 to \$16.8 billion in 1981 despite the \$15.7 billion loss in oil revenue which Iraq had to sustain between 1980 and 1981.

Although Iraq had financial resources and cohesive political leadership it did not have sole control over the direction of the war or the economy. And, as the war continued, the economy could no longer be insulated from the erosive effects of inflation nor could it escape the effects of the rise in import prices or the depletion of its foreign reserves or the withdrawal of foreign labour from major industrial sites. These effects were aggravated by the continued mobilisation of major segments of the labour force as the size of the armed forces increased from 140,000 persons in 1978 to 450,000 persons in 1982. The implications of the increase in the size of the armed forces deserves some elaboration. In 1978 the size of the labour force in Iraq was 2.97 million or 24 per cent of the total population of 12.41 million. Applying the same percentage to the 1982 population of 14.11 million, we get a labour force of 3.39 million. This means that the proportion of the labour force enlisted in the army increased from 4.7 per cent in 1978 to

⁸ Townsend *op. cit.*, p 62.

13.3 per cent in 1982. While the domestic labour force increased by 13 per cent between 1978 and 1982, the size of the armed forces rose by 221 per cent. It should be added that as these forces increase in size so does the number of civilian workers who are employed to provide the necessary support, management and maintenance services to the armed forces. In short, the drain of standing armies on the productive capacity of the economy goes far beyond the mere size of such forces. The loss of a major segment of the domestic labour force to the military economy was more than offset by the rise in the number of women in the labour force and more importantly by importing workers from abroad, mainly Egypt. Thus, between 1978 and 1982 the size of the labour force increased by 2.7 million (from 2.97 million to 5.67 million) while the population of Iraq increased by only 1.7 million during the same period.⁹ Another effect of the war on the economy was the decline in agricultural output. Given the increase in the size of the armed forces and since agriculture employs about two-fifths of the labour force it was inevitable that most of the additional recruits would be drawn from this particular sector. The effect of the war on agriculture can be seen in the decline of wheat output from an annual average of 1.8 million tons in the period 1974–6 to 965,000 tons in 1982 and to only 300,000 in 1984. Comparable data for rice were 98,000 tons, 163,000 tons and 95,000 respectively.¹⁰ But the ability of Iraq to maintain high levels of military and civilian spending could not be supported for too long. Hence, adjustments in economic priorities and spending patterns had to be made.

The year 1982 was a major turning-point, as the war front moved to Iraqi soil. 1982 will also be remembered as the year when in April Syria decided to close Iraq's oil pipelines going through its territories, causing Iraq to lose an export outlet of 400,000 b/d valued at \$5 billion per year.¹¹ As a result of Syria's act, Iraq was reduced to only one export outlet going through Turkey with a capacity of three-quarters of a million b/d, or about one-fourth of its export capacity just before the war. These changes forced Iraq to acknowledge that economic retrenchment was necessary and that no new projects could be undertaken in 1982 until projects under way were completed. However, the government felt

⁹ See Arms Control and Disarmament Agency, *World Military Expenditures and Arms Transfers*, 1985, Washington DC, 1985, p 67, for the size of armed forces. For data on labour force, see Arab Monetary Fund, *Unified Arab Economic Report*, 1983 (no date) p 209 (in Arabic).

¹¹ *Middle East Economic Survey* (MEES) 19 April 1982, p 2.

that it was necessary to continue transportation and construction projects provided that they served the war effort, plus certain projects in urban centres, particularly Baghdad. But as the war continued Iraq found itself once again reducing all non-defence related development spending. Investment in agriculture and industry were reduced drastically and import programmes were subjected to closer scrutiny to ensure that foreign reserves which had declined from \$30 billion at the start of the war to \$10 billion by the end of 1982 would be used judiciously and only when necessary. Furthermore, in 1983 Iraq decided to adopt new and more stringent economic measures. One of the more significant changes in policy was the decision by the government to rely more heavily on the private sector to promote industrial and agricultural output by providing incentives and credits. In order to shore up its sagging foreign exchange position, Iraq found it necessary to enter the international financial market in order to borrow. It also became necessary to reschedule some of its debts to foreign contractors, to use oil for imports trade arrangements, to devalue the dinar against the dollar and to increase its borrowing from the Gulf states which by the end of 1982 had reached \$35 billion.¹² Iraq also decided to curtail its foreign aid to other Third World countries, to restrict foreign travel, and to cut down on imports by limiting them to essential consumer goods only. One measure of Iraq's difficult financial position is reflected in the sharp change in its share in the combined value of projects contracted by members of the Organisation of Arab Oil Exporting Countries (OAPEC). According to data compiled by OAPEC, Iraq accounted for 17 per cent of all such contracts in 1979. This ratio jumped to 30 per cent in 1980 and rose again in 1981 to 31 per cent, only to plummet to 9 per cent in 1982 and 2 per cent in 1983.¹³

By 1983 Iraq was compelled to reduce imports to \$11.7 billion from \$20.5 billion in 1981 or by 43 per cent (Table 2). The drastic reduction in total imports also reflected the new imperatives of the war as Iraq saw them. While total imports declined by 43 per cent, military imports increased by 38 per cent, from \$3.7 billion to \$5.1 billion. On the other hand, non-military imports were reduced from \$16.8 billion to \$6.6 billion or by 61 per cent between 1981 and 1983. This re-orientation of Iraq's imports programme resulted in a reduction of the share of

non-military imports from 82 per cent of all imports in 1981 to 56 per cent two years later.

The war and the Iranian economy

In addition to the loss of oil output and revenue, the war inflicted heavy damage on Iran's pipelines, refineries, infrastructure, industrial sites, factories and cities. Particularly severe was the destruction inflicted upon some of Iran's more populous cities such as Ahwaz, Abadan, Dezful and Khorramshahr. The bombing of these cities in the early phases of the war forced an estimated 2 million people to be relocated in other parts of the country. This internal refugee problem intensified the difficulties for an economy that was attempting to cope not only with the impact of the war but also with some of the dislocational problems of the Revolution.

The Iranian economy, however, proved to be more resilient than was expected. One of the most important reasons for this was Iran's ability to increase its oil output and exports and thus increase its oil revenue and foreign exchange earnings in a very short period of time. Thus the decline in oil revenue from \$13.5 billion in 1980 to \$9.3 billion in 1981 was reversed, with a sharp increase to \$15.9 billion in 1982 and \$18.7 billion in 1983. By contrast Iraq's oil revenue, which declined from \$26.1 billion in 1980 to \$10.4 billion in 1981, fell again in 1982 to \$9.7 billion and to \$8.4 billion in 1983. Another explanation for the resilience of the Iranian economy may be found in earlier policy decisions to reduce dependency on the oil sector and also to reduce imports in

general and non-essential consumer goods in particular. This policy was supplemented by another policy which aimed at stimulating domestic agricultural and industrial output. In the case of agriculture, output of main cereals—wheat, rice and barley—turned out to be higher in 1982, 1983, and 1984 than during the period 1974–6.¹⁴ Industrial output in 1982 had recovered remarkably well to show a real growth rate of 11.6 per cent over the previous year.¹⁵ One of the most interesting changes in the Iranian economy, in contrast to that of Iraq's, was the ability of Iran steadily to increase the level of imports. Thus, total imports which amounted to \$19.8 billion in 1978 declined to \$8.8 billion in 1979, with military imports accounting for 18 per cent of the total. By 1983, total imports had climbed to \$18.2 billion with military imports accounting for only 4.4 per cent of the total. By contrast, Iraq's imports, which reached their peak of \$21.6 billion in 1982 with the military component absorbing 20 per cent of the total, declined sharply by 1983 to \$11.7 billion but with military imports accounting for 44 per cent of the total (Table 3). Iran's ability to increase revenue from oil exports soon after the war was initiated, proved to be a decisive factor not only in enabling it to expand imports but also in preventing a deteriorating economy from disintegrating. The Iranian economy also succeeded in resuming its upward growth trend at remarkable rates once the initial shocks of

the Revolution, the hostage crisis and the war were absorbed and it so without financial help from other countries and without und increasing its foreign debt.

How much did the war cost?

No estimate of the cost can hope to be accurate. Certain elements the cost are known while other elements will have to be estimated. There will also be the tremendous cost burden in the post-war period the two countries attempt to repair and reconstruct their economies a pay for the debts and obligations which they have incurred in the cou of the war. For the period up to the end of 1985 certain estimates will made to arrive at cost magnitudes. Before making these estimat however, it may be useful to make a few general observations regardi the defence burdens of Iraq and Iran.

Defence burdens: some measurements

Both Iraq and Iran have traditionally devoted relatively high portion: their national income to military spending. Between 1968 and 19 Iraq, for example, allocated between 21 per cent and 27 per cent of GNP to military expenditures. Iran's military expenditures during same period absorbed between 13 per cent and 15 per cent of its GNP. The relative burden of military spending would be larger if it is relatec

Table 4: Iran: relationship between military expenditures and GNP, 1977-83 (\$ billion)

Year	Military Expenditures	GNP	GNP minus Oil Revenue	Ratio of Military Expenditure	
				To GNP	To GNP minus oil Revenue

Source: For GNP and oil revenue data, see Table 1. Military expenditures from *World Military Expenditures*, pp 66-7.

national income generated outside the oil sector. Thus in the case of Iraq, such spending absorbed between 26 per cent and 33 per cent of non-oil GNP while its share in Iran ranged between 14 per cent and 17 per cent of non-oil GNP during the same period. The high ratio of military spending to national income becomes even more striking when it is realised that for the Middle East as a whole military expenditures during this period accounted for between 8 per cent and 9 per cent of the region's total GNP and that the average burden of military expenditures for all developing countries did not exceed 6.4 per cent of their GNP.¹⁶

The sharp rise in oil revenue after 1973 made it possible for oil producing countries to increase their public sector expenditures including, of course, military spending. In the case of Iran such expenditures increased from \$3.1 billion or 11.7 per cent of GNP in 1973 to \$12.1 billion or 15.9 per cent of GNP in 1978, the last year of the Shah's regime. By the end of 1979 the newly established Islamic Republic succeeded in reducing military expenditures by one-half, to \$6 billion, or 8.5 per cent of GNP. However, although the outbreak of the war with Iraq made it necessary to increase the defence budget, such spending never reached its pre-1979 levels. Thus, by 1982 military

¹⁶ For data on military expenditures for the years before 1973 see US Arms Control and Disarmament Agency, *World Military Expenditures and Arms Transfers 1967-76* Washington DC, 1978, pp 47-8.

expenditures peaked at \$8.5 billion, or 10 per cent of GNP only to decline to \$5.5 billion in 1983 or 5.5 per cent of GNP.

In the case of Iraq, military expenditures continued their upward trend with no interruption. From \$800 million in 1972 Iraq's military spending increased to over \$5 billion in 1979 and again to close to \$12.5 billion in 1983. Relative to its GNP, Iraq's military expenditures accounted between a low of 14.2 per cent in 1979 and a high of 40.6 per cent in 1982. But if military spending is measured against non-oil sector national income, its burden is much heavier. In Iran, according to this measurement, military spending absorbed between 6.9 per cent in 1983 and 26.2 per cent in 1975. In Iraq, however, the ratio of military expenditures to non-oil sector national income ranged between 25.8 per cent in 1972 and 63.3 per cent in 1980. (Table 5)

Another indicator of the defence burden is the relative importance of the arms imports component in total imports. In the case of Iran, arms imports tended to constitute a much higher ratio of total imports in the years preceding 1980 when the war broke out. Thus, for the period 1974 to 1979 the ratio of such imports to total imports ranged between 11.3 per cent and 18.5 per cent. After the establishment of the Islamic Republic arms imports constituted 3.1 per cent of total imports in 1980, 7.8 per cent in 1981, 13.4 per cent in 1982 and 4.4 per cent in 1983. In the case of Iraq, arms imports constituted between 16.6 per cent and 38.1 per cent of total imports for the period 1974-9. But since the war broke out Iraq's arms imports have represented 13.8 per cent of total imports in 1980, 18 per cent in 1981, 19.9 per cent in 1982 and 43.6 per cent in 1983.

Yet a third indicator of the defence burden is the size of armed forces relative to population. Data published by the US Arms Control and Disarmament Agency show that in 1978 both Iraq and Iran had 11 persons in their armed forces per 100 people. By 1983 the ratio for Iraq had increased to 34.5 persons while in Iran it remained the same. It should be noted, however, that these figures tend to underestimate the defence burden to the economy of this particular indicator since the term armed forces may not include all the parliamentary forces which are engaged in the war effort.

The cost elements of the war

It is estimated here that Iraq has spent about \$94 billion on the war between 1980 and 1985. This figure was arrived at by multiplying the value of arms imports by a factor of 4 which in turn was arrived at by

ECONOMIC CONSEQUENCES OF THE IRAQ-IRAN WAR

Table 6: Iran and Iraq: ratio of military expenditures to oil revenue, 1977-83 (\$ billion)

Year	IRAN			IRAQ

Source: See Tables 1 and 4.

relating total military expenditures in the Middle East for the period 1973 to 1983 (which amounted to \$430 billion) to the total value of arms imports into the region (approximately \$100 billion). The annual cost of the war to Iraq is then estimated to be \$15.7 billion. This figure does not include the value of fixed assets destroyed during the war, nor does it include lost oil revenue or lost output. The figure of \$15.7 billion is somewhat higher than the *Quarterly Economic Review* estimate of \$14 billion per year.¹⁷

Review

As to the cost of the war to Iran, the Iranian government itself maintains that the total cost of the war both direct and indirect amounted to \$150 billion up to June 1982 and \$200 billion up to the end of 1984, not counting lost oil revenue.¹⁸ This means that since 1982 the annual cost of the war was in the vicinity of \$20 billion. Adding the \$20 billion cost for 1985 to the \$200 billion, we arrive at a total cost of \$220 billion.

The next step in the calculation is to estimate the value of oil revenue lost due to the war. By applying the rate of change in the oil revenue of all OPEC member countries to Iraq and Iran we arrive at what might be called implicit oil revenue. And by comparing these figures with actual revenue we arrive at an estimate of lost revenue. According to this

Total (1981-5)			49.3	104.8	77.3	97.8

Sources: Computed from OPEC, *Annual Statistical Bulletin* (Vienna) for oil revenue for the years 1979- 83 and *Petroleum Economist*, July 1985 for the 1984 oil revenue.

Note: Implicit revenue for 1980 was calculated by multiplying the actual revenue in 1979 by the rate of change in OPEC revenue in 1980 or by 42.8 per cent. The 1981 implicit revenue was arrived by multiplying the 1980 implicit revenue by 9.9 per cent, and so on. The 1985 revenue for OPEC was assumed to be the same as 1984.

method, Iraq lost \$55.5 billion while Iran lost \$20.5 billion, or a combined loss of \$76 billion for the period 1980-4. (Table 7)

In addition to these elements one should also add to the cost of the war that part of the national output which would have been produced if the two countries were not at war. In the case of Iraq such loss of output is arrived at by calculating Iraq's potential output and subtracting from it the actual output. To arrive at the potential national output of Iraq the year 1980 was used as the base year. The potential output, or the GNP of Iraq for the years 1981-5 was assumed to have grown at an annual rate of 6.5 per cent in the absence of the war. The selection of the 6.5 per cent growth rate was determined by the fact that the combined GNP of all OPEC member countries grew at an annual average rate of 6.5 per cent during the period 1979-83. Thus, by applying the same growth rate to Iraq's GNP for the period 1981-5 we arrive at potential GNP of \$284.2 billion for the five-year period under consideration. This potential GNP exceeds Iraq's actual GNP for the same period by \$81.7 billion. But, in order to avoid double counting one should subtract from the \$81.7 billion lost GNP the \$55.5 billion lost oil revenue. By doing this we arrive at a figure of \$26.2 billion which is considered to be the war-caused lost output above and beyond lost oil revenue. (Table 8)

ECONOMIC CONSEQUENCES OF THE IRAQ-IRAN WAR

Notes: Potential GNP was computed by applying to actual GNP the annual rate of growth of GNP of all OPEC countries as reported in *World Military Expenditures*, p 67

Similar calculations for Iran are not necessary since such GNP loss has already been included by the Iranian government in its own estimate of the cost of the war to the Iranian economy up to the end of 1984. For the year 1985 it is postulated that the actual rate of growth was of such high magnitude as not to warrant a computation of potential GNP. (Table 1)

The following is a summary of the main cost elements of the war:

<i>Iran</i>	<i>\$ billion</i>
Cost of the war up to the end of 1985	220.0
Estimated lost oil revenue	<u>20.5</u>
Total	240.5

<i>Iraq</i>	
Military expenditures for the years 1980-5	94.0
Estimated lost oil revenue	55.5
Estimated lost GNP, 1981-5	<u>26.2</u>
Total	175.7

Total cost to both countries \$240.5 billion + \$175.7 billion = \$416.2 billion.

To put the cost of the war of \$416 billion in better perspective, it suffices to say that the oil revenue which both Iraq and Iran received throughout this century—from 1919 to 1985 in the case of Iran and from

1931 to 1985 in the case of Iraq—amounted to \$364 billion. That is, the cost of the war already exceeded by \$52 billion the entire revenue from oil ever since these two countries started to sell their oil on the world market. Relating the cost of the war to their GNP, it was found that the average annual cost of the war absorbed 54 per cent of Iran's GNP during the period 1981–5 and 96 per cent of Iraq's GNP during the same period.

It may be relevant to note that the cost of the war in Vietnam during the period 1965–74 amounted to \$356 billion including \$185 billion of lost output and that the annual economic burden of that war ranged between 2 per cent and 3 per cent of the American GNP.¹⁹

The war and Saudi Arabia's oil policy

No assessment of the economic consequences of the Iraq–Iran war can or should ignore the important role which the government of Saudi Arabia played to influence the course of the conflict. In addition to its economic and non-economic support to Iraq, Saudi Arabia employed its considerable oil power in the region and within OPEC to derive maximum benefits, both political and economic, for itself. This section will attempt to deal with Saudi oil policy since the war erupted.

To start with it can be said that the new regime posed a threat to the Saudi government. The threat arose from the regime's religious/political ideology which had the potential of disturbing the equilibrium of the region's established political and economic order. Thus, it became apparent to the Saudis that whatever reservations they might have towards the US-sponsored Camp David Accords would have to be subordinated to their common opposition to the new regime in Iran. This meant that the regional focus of Saudi policy attention had to be shifted from the Arab–Israeli conflict to finding ways and means of dealing with and containing the new realities in Iran.

The Saudi attempt to contain and weaken the new regime in Iran took two forms. First, there was the ever-present 'oil weapon'. Second, the Saudis attempted to rally the other countries of the Gulf behind their leadership against Iranian-inspired or Iranian-style political changes.

As to oil, the Saudis decided to raise their output in 1978 as soon as the Iranian output began to decline as a consequence of oil workers'

¹⁹ See Robert W Stevens, *Vain Hopes, Grim Realities: The Economic Consequences of the Vietnam War*, New York, New Viewpoints, 1976, pp 186–7.

strikes in support of the revolution. Saudi output which was 7.1 million b/d in September 1978 was raised to 10.4 million b/d by December of that year (a jump of 46 per cent), presumably to make up for the loss of Iranian oil to the world market. But the world of oil, it should be stressed, was already suffering from an oil glut. Although Iranian oil was reintroduced to the world market, the Saudis continued their high output of oil well above their traditional level of 8.5 million b/d. The Saudi decision to keep output at a higher than normal level caused oil output in the entire OPEC region in 1979 to rise to 30.8 million b/d from 29.9 million b/d in 1978 despite a decline of 2 million b/d in Iran's output. It is worth noting that the Saudis did reduce their oil output in 1979 below 9 million b/d for three months only—April, May and June. This reduction, it was speculated, was meant to be a protest signal against the US-sponsored Egyptian-Israeli peace treaty, but this pressure signal was both unsuccessful and short-lived. Indeed, the Saudis responded to US pressure by increasing their output back to the 9.5 million b/d level, which they did in July of that year.²⁰

Having decided to continue producing at a high level, the Saudis started to charge lower prices than those charged by their competitors in order to sell their oil. The Saudi policy of higher output in the face of a soft market in 1980 succeeded in causing Iranian output to plummet from 4 million b/d in September 1979 to 1.3 million b/d in August 1980. Since oil is Iran's main export and the main source of its foreign exchange earnings, it was clear that such a reduction was intended to cripple the Iranian economy and with it the Iranian regime. The magnitude of the drastic decline in Iranian exports may be appreciated when it is realised that prior to the Revolution Iran was producing about 5 million b/d of oil and exporting about 5 million b/d. By August 1980 Iran's output (1.3 million b/d) was reduced to one-fourth and its exports to one-seventh of their past levels. The other side of the Iranian loss was the increase in Saudi sales. This rise in Saudi output, it should be reiterated, took place in the face of a soft market and a decline in the output of every other oil producing country. In the Middle East non-Saudi oil output between 1978 and 1980 declined by 13 per cent (from 20.5 million b/d to 17.9 million b/d) while that of Saudi Arabia increased by 20 per cent (from 8.3 million b/d to 9.9 million b/d). It should be noted that the rise in Saudi output and exports took place at

the height of the American hostage crisis, which began in November 1979. Given the common interests of Saudi Arabia and the US, the Saudis in bringing about the drastic reduction in Iran's oil export cannot have been unrelated to the hostage crisis.

When the Gulf war broke out it provided the Saudis with an opportunity to continue to expand their share of the oil market-time at the expense of Iraq as well as Iran. Within a few days of the start of the Gulf war about 4 million b/d of Iraqi and Iranian oil were taken off the world market. This gave the Saudis the opportunity to continue their policy of overproduction. This was done against all the available evidence that market conditions were soft and that the industrial countries were already in command of considerable oil stockpiles.

Saudi Arabia's policies in the aftermath of the Iranian Revolution and the Gulf War were inconsistent and contradictory. On the one hand, the Saudis wanted to weaken Iran's economy and its political system. To do this they had to resort to the only instrument of economic pressure at their disposal, oil. The Saudis used this instrument by reducing their output and selling their oil at lower prices. The loss of market shares to the Iranians at a time of economic and political entanglement with the US and other industrial countries was a serious, but not a fatal blow to the Iranian economy. But the contradiction in the Saudi policy was that its long-term consequences were damaging to the economic interests of all oil producing countries including Saudi Arabia as such a policy could not be discriminatory against the Iranians alone. Oil output and revenue data for the Middle East OPEC oil producing countries indicate how the Saudis exploited the difficulties of Iran first, and

Iraq-Iran war later, to reap a great deal of economic benefits and power. While in 1978 Saudi Arabia produced 40 per cent of the oil produced in the Middle East and received 40 per cent of the oil revenue by 1981, the first full year of the Gulf War, the respective shares were 62 per cent for output and 66 per cent for revenue (Table 9). But the improvement in the position of Saudi Arabia is even more impressive if we were to focus attention only on Iraq, Iran and Saudi Arabia. In 1978 Saudi Arabia received 52 per cent of the combined oil revenue of the three countries with the remaining 48 per cent going to Iran and Iraq (31 per cent to Iran and 17 per cent to Iraq). By 1979 Saudi Arabia managed to raise its share to 58 per cent and to 72 per cent by 1980. In 1981 Saudi Arabia's share reached a staggering 85 per cent of the combined oil revenue of the three countries only to decline to 75 per cent in 1982, 64 per cent in 1983 and 62 per cent in 1984 (Table 10).

Although he did not mention Saudi Arabia by name, the thrust of the critical remarks made by Iraq's President, Saddam Hussain, regarding Saudi Arabia's policy of overproduction was very clear when he said: We direct our friendly but also serious criticism toward some Arab brothers whose production and marketing policies have led to the creation of a glut in the oil market. We cannot possibly find convincing arguments in favour of this policy and its goals. Its harmful effects upon the Arab oil producing states and others is very clear. If some oil producing states have financial surpluses, we do not all possess such an accumulation of wealth. We also do not see any wisdom in production that leads to a glut in the oil market.²¹

²¹ MEES, 27 July 1981, pp 1-2.

While the Iraqi President was appealing to the Saudis to reconsider their high output policy, the Iraqi Minister of Oil, Mr Tayeh Abdul-Karim, who was also a member of Iraq's Revolutionary Command Council, accused the government of Saudi Arabia of creating the oil glut in order to prolong the Gulf War:

That country's policy of continuing its high output beyond its needs is suicidal and cannot be explained in any terms other than the desire to harm others were it not for the oil glut, which may have been inspired and planned to prolong the Gulf War and wear down Iraq, the Gulf War would now be over ²²

Iraq was not the only country claiming that Saudi oil policy was dangerous to the economies of other countries. The Libyan leader, Colonel Muammar Qaddafi, decried the Saudi policy as having 'harmed the people of Algeria, Kuwait, the Gulf and Nigeria.'²³

It is important to note that these protestations from Arab countries came in the wake of Sheikh Ahmed Zaki Yamani's celebrated 19 April 1981 interview on the National Broadcasting Corporation's 'meet the Press' in the United States. In that broadcast Sheikh Yamani boasted that it was the Saudis who had engineered the oil glut when he said:

Q: As a result of conservation, a stagnant economy and other factors, there is now an oil glut on the international market. Some nations and some American companies have been lowering prices. Would your country have any plans to lower production or to lower prices?

A: Well, as a matter of fact, this glut was anticipated by Saudi Arabia and almost done by Saudi Arabia. If we were to reduce our production to the level it was at before we started raising it, there would be no glut at all. We engineered the glut and want to see it in order to stabilise the price of oil.

Sheikh Yamani went on to say that the Saudis could reduce their output to 6 million b/d (or by 40 per cent) and live happily with that.²⁴

Ironically, while Iraq's oil facilities continued to be out of action, the Iranians whose exporting terminals were functioning were able in time to expand their output and export. Iran was able to expand its oil exports through price reduction. By beating the Saudis at their own price game other countries found themselves following the Iranian lead and cutting their prices either openly or through various discount mechanisms. In contrast to these countries, Iraq found itself in more

²² *MEES*, 7 September 1981, p 2.

²³ *Ibid.*

²⁴ *MEES*, 27 April 1981, (Supplement), pp 1-2.

economic difficulties as time went on and the Gulf War continued, especially after Syria's decision to close its pipeline in 1982.

Iran's success in increasing its output and regaining some of the market share it lost to Saudi Arabia created a number of conditions which had a profound impact on the role of these two countries within OPEC and upon OPEC itself. The Saudis, to their detriment, adhered to the position that the glut was not only controllable, since they thought they had created it, but also temporary. As late as April 1982, the then Prince Fahd announced that the oil glut would end in two or three months. This mistaken belief led the Saudis to keep to the official price of oil at a time when Iran and other OPEC member-countries were reducing their prices and recapturing market shares they had lost to the Saudis. The Saudi's continued loss of export markets to other producers prompted them to demand that other countries raise their prices. When such demands were ignored, the Saudis resorted to threats that they would increase output and lower prices in order to impose punitive measures against those countries which were engaged in price cuts. The Saudi threats this time stemmed from a position of weakness in that, with the decline in their output, they were losing control over OPEC and over the oil market. In order to counter the behaviour of Iran and Libya and other producing countries, the Saudis this time took an unusual step by working outside the framework of OPEC. In a meeting of the oil ministers of the six member-countries of the Saudi-led Gulf Cooperation Council (GCC) in October 1982, the ministers attacked other oil producing countries for their 'irresponsible behaviour' and lectured them on how 'to shoulder their responsibilities' and that if they continued in their 'misguided actions,' they would not be protected from the 'consequences of these actions' by GCC member-countries and that the GCC had decided to issue the warning in order to make the 'nonconformists realise that they will have to shoulder the blame tomorrow'.²⁵

It is clear from the text of the statement that the Saudis used the GCC to pressure and threaten other Arab oil producing countries and Iran to fall in line. This meant that the use of the Saudi 'oil weapon' had come full circle. Instead of using it to exert pressure for just Arab causes it was being used now to undermine the economic interests of other Arab countries.

Yet the Saudi-led coalition failed in its attempt to force other

²⁵ For the text of the GCC Oil Ministers' statement, see *MEEs* 18 October 1982, p. 3

countries to raise their prices. Market conditions had changed to the degree that it was simply not feasible to raise prices. The decline in the demand for oil coupled with the effective use of oil stockpiles by industrial countries made it possible for the Iranians and others to assert their position within OPEC. More important, the change in the balance of power within OPEC was manifested also in that the Saudis eventually agreed, for the first time, to an OPEC-wide programme of production allocation. There was a great deal of truth and realism in a statement made by the Iranian Oil Minister, Mr Mohammed Gharazi, when he said:

. . . the political strength of Iran . . . has forced Saudi Arabia to reduce its production from 11 million to 4 million b/d. Saudi Arabia thought that with its level of production it can enforce its wishes on our brothers in OPEC and in the region . . . I announce that my country has fought Saudi Arabia and has caused the failure of its oil production and political aims.²⁶

The acknowledgement by the Saudis of the limit of their oil power came in March 1983. At an unusually lengthy meeting of OPEC in that month the Saudis had to concede that there was an oil glut in the world market, and that the price-setting power had shifted to other oil producing countries; that prices had to be reduced; and that the output of all member-countries had to be regulated.

Economic prospects after the war

The Gulf War, already in its sixth year, has created several structural problems that will require a long time to overcome. As was mentioned earlier, the war resulted in major reduction in oil output, loss of markets and revenues, loss of foreign exchange reserves, destruction of cities, and infrastructure including roads, harbours, transportation and communication systems. The war also crippled the growth of the industrial and agricultural sectors as well as investment and development programmes. It depleted military supplies and caused a rise in the indebtedness of both countries, especially Iraq. The war also distorted the configuration of the various segments of the labour market which resulted in labour shortages and, in the case of Iraq, led to dependence on foreign workers. The war created serious internal refugee problems, especially in the case of Iran, a situation which added to general economic difficulties.

²⁶ *MEES*, 31 January 1983, p D8.

The solutions to these and other economic problems will be more difficult the longer the war persists. But regardless of how long the war lasts, the two countries will have to face the monumental task of repair, reconstruction and development. The task of reconstruction will be complicated by several difficulties and bottlenecks. In the first place and based on historical experience of other countries, the two countries will almost certainly devote considerable economic resources for the purpose of rebuilding and re-equipping their armed forces as well as the replenishing of their depleted stockpiles of arms and munitions.

The task of repair, reconstruction and development will be costly, difficult and long. It will be costly because the replacement cost of new assets will, due to the general rise in prices, be much higher than the cost of the original assets to be replaced. Apart from the monetary cost of replacement there is another form of cost, namely, the time factor. To the extent that major assets such as refineries, factories, airports and the like were produced by foreign enterprises, a long time will be needed for planning and construction. To illustrate this point let us take the case of a refinery or a petrochemical plant which needs to be replaced. In both of these cases the process requires, among other things, that the decision be placed in the national context of an investment plan, that feasibility studies be made, bids be solicited, and contracts awarded and implemented. And since each one of these stages in the process requires foreign labour, raw materials and capital goods, it is not difficult to appreciate the magnitude of the process of reconstruction and development. It will take Iraq and Iran many years to restore their productive capacity to pre-war level.

All of the above, it should be stressed, is predicated on the assumption that financial resources will be available in order to go ahead with the process of reconstruction. Unfortunately, this will not be the case. The main explanation for this is that both Iraq and Iran have become so dependent on their oil sector that the process of reconstruction will hinge on the availability of oil revenue. But herein lies the main problem and bottleneck. If the war were to end soon, both Iraq and Iran would find themselves in a world oil market that has a demand for OPEC oil which is less than one-half its volume when the war started. Currently, OPEC member-countries cannot sell more than 12-13 million b/d compared with almost 27 million b/d in 1980. And in an oil market characterised by severe excess capacity which shows no sign of subsiding, it will be very difficult indeed for either country to expand its output without at the same time taking market shares from

other OPEC member-countries. Indeed both Iraq and Iran have already stated that they must have a higher share in OPEC output than the one they currently have. In the case of Iran the desired target of output is 19 per cent instead of the present 14.4 per cent of OPEC total output or a return to its pre-Revolution share. Similarly, Iraq would like to see its share raised from its current level of 7.5 per cent to its pre-war level of 12 per cent. If OPEC were to accommodate Iraq and Iran then some 10 per cent of current OPEC output would be re-allocated to Iraq and Iran. This would entail major changes in the way quotas are assigned and power is divided within OPEC, an outcome very few member countries would welcome. If, on the other hand, OPEC were to refuse to make the necessary changes, it is not inconceivable that both countries would find themselves raising output and cutting prices in order to recapture their lost shares of the oil market. If they were to follow this strategy it is certain that other producing countries would retaliate by lowering their prices in order to protect their own market shares. Should this be the case it is possible that the OPEC price structure may collapse altogether resulting in ruinous economic consequences for all. It can be argued that most of the adjustment in output should be made by Saudi Arabia for the reasons mentioned earlier and especially because Saudi Arabia was able, because of the Iranian Revolution and the war, to accumulate considerable amounts of reserves. Such expectations are not realistic in light of the established market behaviour of the Saudis, their needs, and their current policies of raising their output and allowing prices to fall below OPEC official prices.²⁷ But even if the Saudis and other members of OPEC were to make certain adjustments this would not be sufficient given the tremendous financial needs of Iraq and Iran. These two countries will almost certainly have to borrow heavily if the process of rearmament, repair and reconstruction and development are to go ahead. But there are at least two constraints on this option. First, the international capital market may not be willing fully to accommodate the capital needs of Iran and Iraq. Second, neither Iraq nor Iran may opt to borrow heavily given the depressed conditions of the oil market and the improbability of their being able to generate a balance-of-payments surplus sufficient to pay back the debt.

²⁷ See Youssef M Ibrahim, 'Saudis decide to raise oil output, spurring chance of a price war', *The Wall Street Journal* (New York) 16 September 1985, p 1 and 'OPEC Officials Nearly Declare a Pricing War', *ibid.*, 10 December 1985, p 2. See also 'Yamani warns price could drop to \$20/B' *MEE5*, 2 December 1985, p A1.

If Iraq and Iran cannot borrow, or will not borrow, and if OPEC member-countries will not meet Iraq and Iran's needs then there is really no alternative but for them to resign themselves to the realisation that their economies will be performing below their pre-war productive capacity for a long time to come.

It is no exaggeration to say that the war has already set back the pace of and prospects of economic development in Iran and Iraq for decades to come.

Israeli foreign policy in Central America

Israeli involvement in Central America is complex, intense, multi-dimensional. It includes arms sales; programmes of military training, agricultural assistance, counter-insurgency advice, economic developmental assistance; the training of internal security police; and the employment of highly skilled military personnel. The multiplicity of capacities. Israel is also involved in significant commercial ventures in Central America. Some Israeli firms have established subsidiaries for the production of military equipment; others engage in construction and agri-business; still others are involved in the distribution and sale of Israeli-made products.

Israel's presence is most extensive in Guatemala; however, Israel is also involved in El Salvador, Costa Rica, Honduras, and Belize as well as in the training and supplying of the anti-Sandinista 'contras'. A brief overview of Israel's activities in Guatemala will serve as an illustration of its Central American entanglements.

Israel and Guatemala have a lengthy historical relationship that predates the establishment of the Jewish state. In fact the individual who headed the United Nations Special Committee on Palestine (UNSCOP) thirteen-nation group appointed by the United Nations in 1947 to determine the disposition of Palestine—who did the most to advance Zionist objectives was a Guatemalan, Jorge Garcia Granados. Among other things Granados made a special effort during the committee's visit to Palestine to meet the terrorist underground (the Irgun Zvai Leumi and the Stern Group), including a lengthy visit with Menachem Begin, head of the Irgun. Granados insisted that a subcommittee of UNSCOP (in which he participated) visit former Nazi concentration camps and displaced persons camps in Europe and then was highly instrumental in linking the 'Jewish Question' and Zionism in the UN debate on Palestine. Granados was also responsible for drawing the boundaries of the Jewish state in congruence with Zionist interests, specifically including Eastern Galilee and the Negev. In addition, he was the forceful advocate of partition among the UNSCOP members.

¹ For a discussion of Guatemala's support for Zionist interests during the United Nations consideration of the question of Palestine (and especially of Granados' personal role) see Jorge Garcia Granados, *The Birth of Israel: The Drama as I saw It*, New York: Alfred A Knopf, 1948.

Guatemala was the second government to recognise the new state of Israel in 1948, after the US. The two countries engaged in bilateral relations through the 1950s, 1960s, and early 1970s, with Guatemala benefiting from the technical assistance programmes Israel designed for Third World nations.² However, in 1977 a convergence of factors resulted in Israel assuming an increasingly important role in Guatemala. These included: (1) President Jimmy Carter's human rights policy; (2) the accession to power of the Likud government in Israel with Menachem Begin at the helm; and (3) the Guatemalan government's continuing attempt to suppress an indigenous revolutionary movement—an insurgency that traces its lineage to a US-sponsored coup in 1954 which toppled the second freely elected president of Guatemala, Jacobo Arbenz. The fundamental preoccupation of the regimes in Guatemala City since 1954 has been the suppression of this guerrilla insurrection.³ It is estimated that between 1954 and 1984,

passim. For the importance placed on Granados' efforts by Zionists see Nathaniel Lorch, 'Latin America and Israel,' *The Jerusalem Quarterly* (22) Winter 1982, p. 71. A revealing analysis of the extensiveness of Zionist diplomacy in the pre-state period in Latin America (which explains to some extent the strong support for Zionist interests that was evident in the debate over partition by many of the Central and South American countries) may be found in Edy Kaufman, 'Israel's foreign policy implementation in Latin America,' in Michael Curtis and Susan Aurelia Gittelson (ed), *Israel in the Third World*, New Brunswick, New Jersey: Transaction Books, 1976, pp. 120–46. Another explanation for the strong support Central American countries gave to the cause of Zionism in 1947–8 resides in the dependency relationship between Latin America and the US, and the general inclination of Latin American countries to follow Washington's lead. In Guatemala's case, in addition, that country was in the process of a democratic state-building experiment (aborted by the US-sponsored coup in 1954) and several Guatemalan leaders, including Granados and President Juan Jose Arevalo, saw parallels between the Zionist experiment of state-building and their own.

² For an analysis of Israel's technical assistance programmes to Third World countries which were traditionally predicated on 'Nahal'-type military-agricultural projects, by individuals sympathetic to Israel's objectives see Edy Kaufman, Yoram Shapira and Joel Baromi, *Israel-Latin American Relations*, New Brunswick, New Jersey: Transaction Books, 1979, pp. 104–26, and *passim*. Also Lorch, 'Latin America and Israel,' pp. 78–9.

100,000 Guatemalans were killed as part of the government's counterinsurgency campaign while the country's human rights abuses have been deemed among the worst in the international system.⁴

In March 1977 the US State Department issued a report condemning human rights in Guatemala. The Guatemalan regime retorted that it would reject in advance any military aid from a government that dared to impose conditions on matters it considered an internal affair, thus pre-empting any move by the US Congress.⁵ Nevertheless, in response to Carter's request, Congress voted to suspend military aid to Guatemala. Since that time Israel has been its principal arms supplier.⁷ (Guatemala received its first Israeli weapons in 1975.⁸)

Guatemala has acquired an assortment of military equipment from Israel including Dabur military patrol-boats, Galil assault rifles, sub-machine guns, ammunition, mines, grenade-launchers, F-4 planes, communications equipment, electronic devices, RBV-1 armoured vehicles, personal gear, and field kitchens.⁹ By 1980

Guatemalan army was fully equipped with Galil rifles at an estimated cost of \$6 million.¹⁰

In addition to military equipment, Israel has provided four successive Guatemalan governments counter-insurgency assistance involving the combined military/agricultural programmes in which Israel specialises. Early in 1977 President Kjell Laugerud Garcia sent two individuals to Israel in search of such advice and aid: Colonel Fernando Castillo Ramirez, Director of the National Institute of Agrarian Transformation (INTA), the major institution in Guatemala concerned with agricultural resettlement in the areas of conflict, and Leonel Giron, an agricultural economist in charge of the settlement programmes in the Franja Transversal del Norte. Shortly after their visit Israeli advisers arrived in Guatemala to plan 'civic-action' programmes in the conflictive Ixcán area in El Quiché, heartland of the revolutionary

world,' *Mother Jones*, July 1985; 'Israel's part in Central America (II),' *Central America Report*, 14 December 1984, p 386; Dial Torgerson, 'US not only arms supplier in Central America,' *Houston Chronicle* 17 January 1983; 'Israel arms for sale,' *Time* 28 March 1983; Ronald Slaughter, 'Israel arms trade: cozying up to Latin armies,' *NACLA Report on the Americas* 16(1) January/February 1982, pp 49–54; 'Problems from the barrels of Israeli guns,' *Latin America Weekly Report*, 16 May, 1980, p 10; Tim Coone, 'Israel's dangerous exports,' *New Statesman*, 9 May 1980, p 705; Cynthia Arnson, 'Arms race in Central America,' *The Nation*, 10 March 1979, p 267; George Black, 'Israel connection: not just guns for Guatemala,' *NACLA Report on the Americas*, May/June 1983, p 44; *The Economist* (London), 3 April 1982, reported that Israel was Guatemala's major arms supplier. For more information on Israeli arms sales to Latin America in general see: Leslie H Gelb, 'Israel said to step up Latin role, offering arms seized in Lebanon,' *New York Times*, 17 December 1982 (Gelb cites an instance when Secretary of State Alexander Haig 'prompted Israel to do more in Guatemala. By all accounts,' Gelb commented, 'Israel needed no prompting.') Dan Goodgame, 'Israel arms merchants find eager buyers in Latin nations,' *Miami Herald*, 13 December 1982; Esther Howard, 'Israel: the sorcerer's apprentice,' *MERIP Reports* (112) February 1983, pp 16–30; Benny Morris, 'Arms at any price,' *Jerusalem Post*, 4 June 1982; John Yemma, 'Israel guns for worldwide arms market,' *Christian Science Monitor*, 27 December 1982; Penny Lernoux, 'Who's who of dictators obtain arms from Israel,' *National Catholic Reporter*, 25 December 1981; A J McIlroy, 'Israel: arsenal of the Third World,' *The Sunday Telegraph*, 28 August 1983; Meir Pa'il, 'The folly of Israeli arms deals,' *Gensis* 2, July/August, 1983 (copyright Jewish Student Press Service, May 1983); Moshe Lichtman, 'Israel's weapon's exports—is it good for the Jews?' *Monum*, July, 1983, translated by Israel Shahak. (The Shahak Papers) Collection: 'The Israeli export of weapons,' Jerusalem, undated, but circa August 1983; and Stockholm International Peace Research Institute (SIPRI) *Yearbooks*, 1978–84.

¹⁰ Black, *et al.*, *Garrison Guatemala*, p 155. Because the issue of weapons sales is shrouded in great secrecy in Israel—owing in part to the fact that many arms transactions are private, involving no official sanction, and in part to government policy mandating secrecy—it is difficult to calculate the value to Israel of arms sales to specific countries or regions. Israeli analyst Aharon Klieman estimates that Latin America as a whole accounts for one-third to one-half of all Israeli weapons exports. (Arron [Aharon] Klieman, *Israel's Global Reach: Arms Sales as Diplomacy*, New York: Pergamon-Brassey's 1985, p 132) adding further that Argentina alone contributes thirty per cent to that total. (*Ibid.*, p 136) Of the remaining Latin American countries receiving Israeli arms, Guatemala undoubtedly ranks high in its value to Israel. However, beyond such generalisations one can only speculate on the worth of Guatemalan purchases to the Israeli arms industry.

movement and scene of constant military repression.¹¹ The programmes were initially developed through the General Directorate of Agrarian Services (DIGESA), particularly in Ixcán. (Agriculture: resettlement schemes have been an integral part of Guatemala's counter-insurgency strategy from the outset but they became significantly more sophisticated—and successful—in 1982. They have included 'scorched earth' tactics, major resettlement of peasants, and the virtual destruction of the traditional patterns of Indian social economic and cultural life.¹²)

In January 1978 Israel's Mashav (the International Cooperation Division of Israel's foreign ministry which coordinates the technical assistance programmes) initiated a two-year programme of grants for Guatemalan officials to study agricultural cooperative schemes in Israel. Fifty scholarships were made available for Guatemalans and a steady stream of planners, economists, and credit managers flowed from the National Agricultural Development Bank (BANDESA), DIGESA and INTA. A significant portion of those who went to Israel were high officials of the Guatemalan army.¹³

In February 1979 the Settlement Study Centre at Rehovot (a research and training institute affiliated with the Ministry of Agriculture)¹⁴ provided additional scholarships for officials and employees of INTA in conjunction with a rural pacification plan initiated by President Romeo Lucas García (fraudulently elected in March 1978), known as the 'Integral Plan of Rural Communities'.¹⁵ That plan, said to have contained some elements of Israeli agricultural models, especially the kibbutz and the moshav,¹⁶ was never implemented as the Lucas García regime rapidly descended into anarchy.¹⁷

General José Efraín Ríos Montt, who seized power from Lucas García in a coup in March 1982, instituted a new rural pacification

¹¹ Black, 'Israeli Connection,' p. 45.

¹² For several discussions of Guatemala's rural pacification programmes (and in some of the sources Israel's role in these programmes) see Frank and Wheaton, *Indian Guatemala*, pp. 80-9; LeMoyné, 'For the Mayas: one more calamity,' Allan Nairn, 'The guns of Guatemala,' *The New Republic*, 11 April 1983, pp. 17-21; Clare Maxwell, 'Guatemala: counterinsurgency plan eradicating native way of life,' *Latin America Press*, 25 October, 1984, pp. 3-4; Nancy Peckham, 'Bullets and beans,' *Multinational Monitor*, April, 1984, pp. 1-3; Black, 'Israeli connection,' pp. 43-5; Nancy Peckham, 'Campos de re-educación para los indígenas,' *Urmas Uno* (Mexico City), 12 February 1984; NACLA's, *The War is Not Over*, pp. 2-38.

programme—the Plan of Assistance to Conflictive Areas (PAAC)—commonly known as ‘Beans and Bullets’. The plan was conceived by Colonel Eduardo Wohlers and General Fuentes Corado, allegedly in conjunction with Israeli advisers. It involved, essentially, the elimination by force of any peasant who did not accept the government programme and ‘rewarded’ those who did with food. An initial violent crusade was unleashed against the peasants, followed by dozens of projects in the rural areas—many of which were initiated and implemented by Israelis—including housing construction in the model villages, road building, new water systems, and so on.¹⁸

One other part of the rural pacification programme that most analysts believe was suggested by Israelis, is the use of indigenous Indians in civil defence patrols to police other Indians. These patrols, which effectively serve the function of ‘divide and rule’ by setting peasant against peasant, are a fundamental key to the whole counter-insurgency strategy. Membership in the patrols is compulsory; those who refuse to join are regarded as subversives. The patrols are organised and controlled by the army and its local supporters; the peasant ‘recruits’ are then given a weapon and instructed to ‘watch’ other peasants for signs of revolutionary inclinations. There are ‘carrots’ for peasants who identify subversives and there is punishment, including death, for those who fail.¹⁹ Approximately one million civilians have been forced to join the civil defence patrols.²⁰

Ríos Montt was overthrown in a coup in 1983. The new government of General Humberto Oscar Mejía Víctores was more selective in the executions and disappearances of Indians. In addition, Mejía Víctores began a major consolidation of the rural pacification, focusing on resettlement of Indians in model villages, strengthening the civil defence patrols, developing the ‘food for work’ programme (relabelled in Ríos Montt’s last months ‘Roofs, Work, and Tortillas’), and massive developmental schemes initiated by the oligarchy. Israeli advisers are believed to have participated in every phase of this programme.

²⁰ SIAG, ‘Troubled democracy.’

While undoubtedly Guatemala has drawn on the experience of several sources for its counter-insurgency models including the 'strategic hamlets' in Vietnam as well as advice from Taiwanese, South African, Argentinian, and other 'experts', numerous Guatemalans have singled out Israel for special praise. For instance, Col Wohlers, Director of the PAAC, stated that Israel was the main source of inspiration for Guatemala's counter-insurgency agrarian strategy. 'Many of our technicians are Israeli-trained. The model of the kibbutz and the moshav is planted firmly in their minds. And personally I think it would be fascinating to turn our highlands into that kind of system.'

A Guatemalan national interviewed by Guatemalan scholar George Black in Mexico City had the following to say about Israel's role in the rural pacification campaign:

Agriculture holds the key to Israel's current role. In it [there is] an interlocking mosaic of assistance programs—weapons to help the Guatemalan Army fight the opposition and lay waste to the countryside, security and intelligence advice to control the local population, and agrarian development models to construct on the ashes of the highlands.²²

In January 1982 a Guatemalan City political and business leader told a *Los Angeles Times* correspondent: 'We're isolated internationally. The only friend we have left in the world is Israel.'²³ Early in 1982 Guatemala formally expressed its gratitude to Israel for the assistance it had been providing by awarding the previous ambassador to Guatemala, Elieser Armon, that country's highest honour, the Order of the Quetzal (Grand Cross).²⁴ At the award ceremony Armon and I were praised for the 'wide variety of productive activities' in which Israel was engaging in Guatemala.²⁵

In addition to the sale of military equipment and its multifaceted involvement in the counter-insurgency campaign, Israel has also been involved in a number of other capacities in Guatemala. For example, Israel constructed a computer centre in Guatemala City that became operational in late 1979 or early 1980 and is believed to contain information on 80 per cent of the Guatemalan population. This computer centre has also been used as part of the counter-insurgency

campaign). Tadiran Israel Electronics Industries had the contract for that project.²⁶

Israel Aircraft Industries installed its Elta radar air traffic control system at the Aurora International Airport near Guatemala City. The system has subsequently been manned by Israeli technicians.²⁷

In 1981 the Guatemalan Army opened an electronics school, built, funded and staffed by Israelis, and heavily invested in by the Israeli firm Tadiran.²⁸

Tahal Consulting Engineers has won numerous contracts in Guatemala for the construction of dams, land reclamation, irrigation, drainage, and other projects related to the utilisation of water.²⁹

A munitions factory in the department of Alta Verapaz, reportedly heavily invested in by Eagle Military Gear Overseas, produces bullets for the Israeli-made Galil rifle. The factory also contains an annexe where armoured vehicles are assembled.³⁰ There have been reports that

²⁶ Sources differ on exactly when the system was installed. Frank and Wheaton, *Indian Guatemala*, p. 59 state that it was in operation in 1979. Jane Hunter, 'Israeli computers in Guatemala and El Salvador,' *Israeli Foreign Affairs* I (4), p. 1, states that it was in operation in 1980. Yoseph Pri'el reporting in *Davar* (Israel), 13 August 1982, states that it was operational 'last autumn,' meaning 1981. *Latin American Political Report*, 6 November 1981 notes the *successful* use of the system in the summer of 1981 in detecting twenty-seven guerrilla safe houses in Guatemala City. No one questions its existence and functions. For additional information on the computer system see: Guatemalan Information and Analysis Service (SIAG), 27 April 1984; Clarence Lusane, 'Israeli arms in Central America,' *Covert Action* (20) Winter 1984, p. 36; *ORPA Denuncia*, p. 3; Israel Shahak (The Shahak Papers—Translations and Commentaries on the Hebrew Press), Jerusalem, 29 August 1982; Amnesty International, *Guatemala: A Government Programme*.

Also see the analysis by Israel Shahak, (Shahak Papers) 'Report on the recent Israeli involvement in Central America,' Jerusalem, 1 December 1981.

²⁹ Personal interview with an American engineer employed by an American firm which has traditionally done considerable business in Guatemala but increasingly finds his company outbid by Israeli firms.

³⁰ See *Nuevo Diario* (Nicaragua), 9 November 1983; *Granma* (US), 30 October, 1983; *Disweek* (Belize), 18 November 1983; *Guardian* (US), 16 November 1983; Guatemalan Information and Analysis Service (SIAG), 27 April 1984. There are numerous sources which argue that the plant was built with Israeli capital and technology, and that Israeli technicians set up the factory. See for example: *Latin America Regional Report*, 2 December 1983 and *Enfoprensa*, 6 January 1984. Other sources have alleged that Austria is the major external investor in the munitions factory. It has been impossible for this writer to verify with absolute certainty the Israeli role in investment and construction of the munitions plant. However, since it was built to produce bullets for the Israeli Galil (and is expected to produce the Galil itself in the future); it is not unreasonable to accept the reports of those who argue that Israeli interests are the major ones behind it. On the other hand one would want to know the profit-sharing arrangements between the foreign investors and the Guatemalans. Also see: Stephen Kinzer, 'Guatemalan spurns renewed US military aid,' *New York Times*, 7 July 1984.

there are plans for building the Kfir aircraft in Guatemala,³¹ although has not been possible independently to verify this and there are a number of reasons to doubt the feasibility of such a project. However, as several Israelis have argued, Guatemala is most likely the primary centre of secondary distribution of Israeli military equipment for Central America.³²

In addition, Israeli advisers have been intimately involved in a variety of capacities with the Guatemalan government and armed forces—with the security police and the regular army and air force. The Israeli presence expanded from eighteen in 1970³³ to some 300 by 1983³⁴ and was transformed from a fundamentally agricultural orientation to an essentially military/security function. In December 1982 the *New York Times* reported the presence of Israeli military advisers in Guatemala and numerous sources, including both Israeli and Guatemalan, have reported that Israeli advisers assisted in the planning and implementation of the coup that overthrew Lucas Garcia and brought Ríos Montt to power.³⁵ Other sources have linked Israeli advisers to numerous military and paramilitary activities in Guatemala, though it is impossible to verify with certainty the extent of Israeli involvement in these more unsavoury endeavours.³⁷

³⁷ Israel Shahak, in the collection 'Report on recent Israeli involvement in Central America' (December 1981), states: 'An especially important item of Israeli export are the so-called "anti-terror" Israeli specialists. These are really experts in torture, especially in the sophisticated methods of torture, such as inflict maximum amount of pain without killing. Israeli "specialists" who return home, blame very much "the local torturers" for "emotional" and so "killing too early," and in their opinion, "unnecessarily." Guatemala has become the centre for training of torturers by Israeli "experts" in this trade, and for other

These are but the highlights of Israel's involvement in *one* Central American country. Additional details of Israel's involvement in Guatemala may be found in several sources,³⁸ and details of Israel's involvement throughout Central America are also available.³⁹ The remainder of this article will focus on an analysis of the reasons for Israel's involvement in Central America.

There are four main factors that underlie Israel's foreign policies in Central America—factors which are also relevant to an understanding of all Israeli–Third World relations.

First, there is a direct link between Israel's policies in the Middle East and its activities in Central America: indeed, the Central American entanglements are an extension of the country's regional objectives. Second, there is a connection between Israel's domestic political situation and its Central American involvements. This linkage is related to the intensifying militarisation of Israeli society—which itself is related to the country's Middle East goals—and is reflected in the fact that the military—the army in particular—has become an increasingly independent power in Israel. This has resulted in foreign policy decisions being dominated by the military and by military-industrial interests. Indeed, the growth of the corporate military sector in Israel—also related to Israel's regional objectives, as well as to the personal interests of the industrial and governmental elites—is a major aspect of its Central American policies. Third, there is a significant congruence between the outcome of Israel's involvements in Central America and the United States' interests in that region, although Israeli policies are not necessarily dictated by the United States' wishes. While the United States attempts to use Israel to further its own objectives in Central America, Israeli policies are sometimes undertaken with the specific intention of lessening its dependence on the United States and increasing its general foreign policy independence. In the instances when Israel's policies are initiated with the objective of serving American interests, they are done so primarily as a means of further

as well. The case of El Salvador where the Orden people are trained by Israelis in Guatemala, has been known for some time.' On the intimate relationship between Guatemala and the death squads in El Salvador see the series of articles written by journalist Craig Pyes which appeared in the *Albuquerque Journal*, 18–22 December 1983.

³⁸ See Cheryl A Rubenberg, 'Israel and Guatemala: a case study of Israeli foreign policy,' *MERIC Reports*, April–May, 1986; Perera, 'Uzi diplomacy,' pp 40–8.

³⁹ See Margo Gutierrez and Milton Jamail, *Israeli Military Involvement in Central America*, Belmont, Mass.: Association of Arab-American University Graduates, 1986 and Benjamin Beit-Hallahmi, 'US–Israeli–Central American connection,' *The Link* 18(4) November 1985.

cementing the US-Israeli tie in order to increase Israel's leverage on Washington's Middle East policies. Some Israeli 'policies' are mere happenstance—the outcome of initiatives by individuals, corporations and institutes operating without any overall policy directive from the Israeli government. Nevertheless, there is a striking convergence between the results of all these policies, regardless of their motivation and American interests. Fourth, because of Israel's international isolation it has made a concerted effort to develop programmes of assistance for Third World countries as a means of increasing its global friendships. Because of the crucial support which several Central American states gave to Zionists in the pre-state period and during the early years of statehood, Israel has focused special attention on that region.⁴⁰ Moreover, because of its international isolation, Israeli leaders have reasoned that they could not be particular about the kind of regimes they assisted. One prominent Israeli stated, when queried about the Israeli-Guatemalan relationship:

Israel is a pariah state. When people ask us for something, we cannot afford to ask questions about ideology. The only type of regime that Israel would not support would be one that is anti-American. Also, if we can aid a country that it may be inconvenient for the US to help, we would be cutting off our nose to spite our face not to.⁴¹

The following analysis elaborates on these four factors.

The linkage between Israel's Middle East regional objectives and its involvements in Central America results from the nature of those goals which include: (1) absolute military superiority *vis-à-vis* the Arab states; (2) the suppression of Palestinian self-determination, (3) the Judaisation of Jerusalem and maintenance of the formal annexation legislated in 1980, (4) integration of the bulk of the West Bank with Israel, (5) retention of the Golan Heights, and (6) some type of control over south Lebanon.

The effort to realise these regional objectives has given rise to certain domestic conditions which have international implications. For example, for eighteen years Israel has maintained a military occupation

⁴⁰ It is interesting to note that Israel is the only extra-hemisphere member of the OAS besides Spain.

⁴¹ Public statement in lecture delivered by Yohanan Ramati, editor of the Israeli journal *Economist* and former member of the Foreign Relations Committee during the Likud Government (1977-84), Florida International University, Bay Vista Campus, 6 March 1984. Regarding Israel's support for international pariahs it is worth recalling Israel's strong backing for Anastasio Somoza until the very hour of his departure from Nicaragua.

over the West Bank and the Gaza Strip, as well as the Golan Heights. Thus an entire generation of Israelis has been trained to impose Israeli rule over subject peoples. Retired General Matti Peled has commented on one consequence of this: 'Israel has given its soldiers practical training in the art of oppression and in methods of collective punishment. It is no wonder, then, that after their release from the army, some of those officers choose to make use of their knowledge in the service of dictators and that those dictators are pleased to take in the Israeli experts.'⁴² Peled is referring here to the large number of retired officers and military men who independently seek employment with foreign governments. Arich Egozi writing in the Hebrew newspaper *Yediot Ahronot*, notes that these individuals have become a major Israeli 'export article'.⁴³ In analysing the presence of Israeli advisers in any given country, as, for example, Guatemala, it is difficult to ascertain how many are there on government-to-government programmes and how many are working as mercenaries on their own. However, whatever the nature of their tenure, the high quality of the expertise that they offer is widely acknowledged.

Peled further comments on the consequences of the militarisation process:

In recent years Israeli policy has been that of unrestricted rearming. The Israeli army has been increased far beyond the real security needs. . . . The increase in armament and the direction of large parts of the resources of the Israeli economy toward military industries necessitates then the seeking of markets for the arms, necessitates not to be choosy in the clients who want to buy Israeli arms and turns Israel into a merchant of blood.⁴⁴

Peled thus provides some insight into Israel's inexorable search for markets for its military equipment. However, it is to be noted that the process of militarisation in Israel began before the 1967 June War. Israel was born out of a military struggle involving the terrorism of the Irgun and the Stern as well as the 'regular' ground and air campaigns of the Haganah, resulting in the forcible displacement and dispossession of over 770,000 indigenous inhabitants from the country which became the state of Israel. Israel quickly developed a policy of massive military 'reprisal' against neighbouring Arab states to deal with incursions by dispossessed Palestinians. In 1956 Israel engaged in its first major offensive

⁴² Matti Peled, M K, 'Israel and the arms market,' *Ha'aretz*, 4 March 1985, translated by Shahak. 'The Israeli Military Industry.'

⁴³ Arich Egozi, 'An Israeli for hire,' *Yediot Ahronot*, 3 April 1985, translated by Shahak. *op. cit*

⁴⁴ Peled, 'Israel and the arms market.'

military campaign. The 1967 June War was a second offensive strike followed quickly by the development of an ideology and practice institutionalise its occupation while initiating a process of colonisation of the conquered territories. Israel engaged in the War of Attrition with Egypt during 1967–9, battled with Syria and Egypt over retention of their territory in 1973, and invaded Lebanon in 1978 with a greatly expanded sequel in 1982. Thus as a result of frequent external war and military strategy of massive reprisal (as well as 'pre-emptive') occupation, the need to suppress the Palestinian population under occupation, colonisation, and a tendency for military leaders to assume high government office, Israel has become increasingly militarised. It is also important to note as Israeli Professor Aharon Klieman demonstrated in two recent works that:

Most of the men at the top of the hierarchy in each of the groups within the coalition [i.e. government officials, military, and the business community] share a common military background; many are former career officers. . . . This understanding of modern Jewish history, with its themes of the Holocaust and powerlessness, reinforced by long professional military training, causes the elites to be impressed by visible manifestations of power and strength at the same time that they are inclined to be cynical toward false standards of international conduct.⁴⁵

Another aspect to the analysis of Israel's growing militarism is the length of military service in Israel—both compulsory and reserve duty—has not been shortened to conform to the changed strategic situation in the post-1967 period, which was totally transformed in Israel's favour.⁴⁶ One result of this is that there are, as noted, hundreds of military 'experts' looking for employment outside Israel. Likewise in spite of the positively altered strategic environment, the Israeli defence budget has continuously increased rather than stabilising or decreasing. What is more, as Ze'ev Schiff, military correspondent for *Ha'aretz* notes, the finance ministry (the civilian sector of the government dealing with budgetary affairs) no longer controls the defence budget. Instead, it is controlled separately—and secretly—by top military personnel in the defence ministry, suggesting the enhanced power of

⁴⁵ Klieman, *Israeli Arms Sales*, p. 37 and pp. 34–9. Also see Klieman, *Israel's Global Reach*. In addition see Yoram Peri and Amnon Neubach, *The Military Industrial Complex in Israel: A Pilot Study*, Tel Aviv: International Center for Peace in the Middle East, January 1985.

⁴⁶ Daniel Friedmann, 'Soldiers forever,' *Ma'ariv*, 3 May 1985, translated by Israel Shahak, (Shahak Papers) Collection: 'The further militarization of Israeli society and its economy and the belated protest against this tendency,' Jerusalem, no date, but circa May 1985.

military in the Israeli polity.⁴⁷ Indeed, another result of the process of militarisation is the heightened role of the Israeli Defence Forces (IDF) as a power factor and a decision-maker within Israel. This leads to policies—both regional and international (eg, Central America)—emphasising military solutions to all situations.

Finally, it is evident that the regional objectives and the concomitant process of militarisation have made Israel an expert in a variety of techniques that are extremely useful to regimes such as Guatemala and El Salvador. For example, Israel's successful counter-insurgency policies (developed to suppress the Palestinians) have been important models for both countries, though they have been much more systematically and successfully employed in Guatemala.

Israeli's commercial and economic interests in Central America are also related to its Middle East objectives, particularly the goal of maintaining absolute military superiority in the area.

Analysts rank Israel as the fourth strongest military power globally and (depending on the analyst) as either the seventh or twelfth largest exporter of conventional weapons.⁴⁸ Israel's export interests are related to its desire for military dominance coupled with its desire for self-sufficiency in arms production. The official US arms embargo in 1948, the French embargo in 1967, and the brief delay in the US airlift during the 1973 war—in the context of Israel's commitment to military superiority, its preference for dominating its neighbours rather than seeking accommodation with them, and its determination to suppress Palestinian nationalism—have provided the impetus for independence in armament production. However, the small size of the country as well as its inherent financial weakness made the development of a military-industrial complex on the desired qualitative scale problematic. Thus the development of external markets was essential to solve the 'economy of scale' problem in military production. In addition, the export of arms has sustained production at full capacity, facilitating strategic planning and stockpiling, and assuring supplies when needed; at the same time permitting scarce resources to be spent on science and technology, and on research and development—thus maintaining the country's qualitative edge.⁴⁹

In addition, there have been significant economic motivations

⁴⁷ Ze'ev Schiff, 'The show in the hole,' *Ha'aretz*, 29 April 1985, translated by Shahak. *Ibid.*

⁴⁸ Klieman, *Israeli Arms Sales*, p 5. Klieman ranks it twelfth.

⁴⁹ *Ibid.*, pp 18–21. Also see: Jean A Briggs, 'We need entrepreneurs, not military heroes,' *Forbes*, 7 November 1983, pp 134–42.

associated with the production of armaments for export. Israel's 150 companies that engage in the manufacture of exportable military equipment employ, directly or indirectly, 60,000 people—some 18–20 per cent of the entire (non-Arab) industrial work force. Moreover, weapons transfers represent one-fifth of industrial exports and one-tenth of all exports.⁵⁰ Thus, both levels of employment and balance-of-payments considerations are critically related to the sale of military equipment. In fact, it has been the arms export programme which has salvaged Israel's trade position in the face of a chronic trade deficit. Thus, as Israeli analyst Edy Kaufman notes, 'In order to understand the nature of Israel's military negotiations with Central America, one must realise that Israel would not refrain from selling arms to any regime, whatever the political orientation of that regime.'⁵¹

Analysing the convergence of Israeli and US interests in Central America and sorting out which Israeli policies are motivated by a desire to serve US interests, which are motivated by a desire to further Israel's independence from the United States, and which are mere happenstance is fairly complex and space does not permit such an analysis here. However, several factors converged in the fall of 1981 which suggested that Israel was pursuing policies designed in large measure to serve US interests. (At the same time, though, Israel was fulfilling a number of objectives of its own through these policies.)

First, General Ariel Sharon had been appointed Minister of Defence in the second Begin Administration, and both Begin and Sharon felt strongly that insofar as they could cement Israeli ties with Washington by performing indispensable functions for the United States in third countries (especially ones of such strategic significance to Washington as the Central American nations), Israel would have greater leverage over Washington's Middle East policies. This was particularly important to Sharon, who by the Autumn of 1981 was planning for the invasion of Lebanon, and wanted to be certain that the US-Israeli partnership was strong enough to deter any adverse reactions from Washington to the Lebanon campaign. (At the same time there seems little doubt that the Begin government felt a genuine affinity with the rulers in Guatemala City who were battling for their 'survival' against a widespread and determined revolutionary movement. It is likely, too, that Begin and his colleagues remembered with gratitude the support given by Guatemala for their interests—indeed for their personal

⁵⁰ Klieman, *Israeli Arms Sales*, p 215, *op. cit.*

⁵¹ Kaufman, 'The view from Jerusalem,' p 45, *op. cit.*

cause—in 1947. However, such ideological and personal factors, while noteworthy in-and-of themselves, do not transcend the *realpolitik* analysis.)

Second, the Reagan Administration was extremely concerned about events in Central America, and was determined to foster an outcome in El Salvador and Nicaragua consonant with its conservative anti-Communist ideological world view. In addition, Guatemala's significance in the overall regional strategy was an important concern, and the administration chafed under Congressional restraints limiting its ability to assist the Guatemalan government.

The above two factors converged in a third element. The United States and Israel signed a Memorandum of Understanding on Strategic Cooperation on 30 November 1981. The aspect of that accord which applied to Third World countries involved differing, but parallel motivations for Israel and the United States. The Reagan Administration hoped to use Israel to continue support for pro-American regimes and non-regime groups such as the 'contras', which it could not openly aid as a result of Congressional restrictions and/or public opinion.⁵² Israel sought to strengthen its ties to Washington by providing arms and advisers to countries wherein it was politically difficult (from a domestic standpoint) for the United States to do so, for example as regards training and supplying the 'contras' or sending military advisers and armaments to Guatemala. By performing such a 'proxy' function for the United States, Israel, as noted, expected to be able to increase its pressure on Washington to mould American policies on the Middle East in congruence with Israeli objectives.⁵³ In addition,

⁵² See Philip Taubman, 'Israel said to aid Latin aims of US,' *New York Times*, 21 July 1983, who wrote: 'Israel, at the request of the United States, has agreed to send weapons . . . to Honduras for eventual use by Nicaraguan rebels . . . The new role brings Israel closer to acting as a surrogate for the United States . . . American officials said that the Reagan Administration, concerned about congressional limitations on involvement in Central America, had encouraged the Israeli activities as a means of supplementing American security assistance to friendly governments.' Also see John Goshko, 'US, Israel discuss increasing aid to Third World countries,' *The Washington Post*, 27 April 1984; Wolf Blitzer, 'US wants Israeli aid in Central America,' *Jerusalem Post*, 22 April 1984—Blitzer noted that the 'administration would like to see Israel encourage its own supporters in the Congress and elsewhere to become more assertive in backing the "contras" . . . For a detailed and sound analysis of the meaning of the memorandum for Israeli activities in Third World, especially Central American, countries see: 'Israel steps into the breach,' *Latin America Weekly Report*, 18 December 1981. Also see: Joe Stork, 'Israel as a strategic asset,' *MERIP Reports* (105) May 1982, p 12, and *passim*; and Howard, 'The sorcerer's apprentice,' pp 16–30.

⁵³ It should be noted that even when Israel has acted to further the anti-Communist ends of the Reagan Administration, its own predilections on this issue differ markedly from Washington's. For an excellent analysis of the divergent perspectives of Israel and the US in the implementation of 'strategic cooperation'—ie, Washington wanting to focus on anti-Communist

Israel would benefit economically from the increased markets for its military products. This, of course, contributed to Israel's independence in armament production and therefore to a lessening of its dependence on the United States, at the same time aiding its balance of payments. Moreover, the 1981 memorandum provided that Washington would grant third countries permission to spend part of their US military credits in Israel. The provisions in the agreement related to such matters did not entirely satisfy Israel; nevertheless, the *Jerusalem Post* claimed that the memorandum 'laid the groundwork for using Israel's defence needs and the American aid that nourishes them, to create a broader base for Israel's industrial development'.⁵⁴

The strategic cooperation agreement was 'suspended' less than a month after it was signed as a result of Israel's annexation of the Golan Heights, but Defence Minister Sharon insisted that it remained 'secretly' in effect.⁵⁵ The accord was formally reinstated in November 1983. Part of the discussion leading to its reinstatement was a specific proposal that Israel become a conduit for American aid to 'anti-communist' forces in Central America—again primarily the 'contras' and the Guatemalans (though also to El Salvador)—through a fund the administration would establish independent of the government budget to finance projects implemented by Israeli 'experts'.⁵⁶

contingencies and Israel wanting to focus on its traditional interest in fighting land and air wars with Arab states and combating PLO 'terrorism'—see Leslie Gelb, 'United States-Israeli talks said to aim at Soviets,' *New York Times*, 20 July 1984. Israel has many reasons for being less fanatically 'anti-Communist' than the US—for one its desire to maintain the flow of Soviet Jewish immigrants.

⁵⁴ See the analysis in *Mideast Commentary* (7) January, 1982.

⁵⁵ For a lengthy report and analysis see: Dan Goodgame, 'Latin America provides market for Israeli arms,' *Miami Herald*, 13 December 1982. Goodgame quotes Yoav Karni of Israel's *Yediot Ahronot* as stating: 'The Israelis may be seen as American proxies in Honduras and Guatemala just as the Cubans are proxies for the Soviet Union . . .'

⁵⁶ The proposal was discussed in a *New York Times*, 22 April 1984 article, excerpted from *Ha'aretz*, although the Israeli government officially denied it was going to play such a role. See also: Frank Greve, 'Israel reported set to pick up US role with Latins,' *Philadelphia Inquirer*, 31 May 1984; Edward Walsh, 'Israel's diplomacy makes Central America a market for its arms,' *Washington Post*, 16 June 1984. Also see the earlier article by Dan Goodgame, 'Israel asks US to finance sales to Latin America,' *Miami Herald*, 13 December 1982. Goodgame discusses Israeli requests of the American government to allow countries in Latin America and elsewhere to spend part of their American military aid (Foreign Military Sales credits) in Israel (with Israeli firms); and to have Washington funnel military aid through Israel to countries like Honduras and Guatemala. It is clear that part of the November 1983 strategic cooperation agreement was the Reagan Administration's acquiescence to these requests. The Guatemalan Information and Analysis Service (SIAG), in its 14 September 1984 Weekly Letter, 'The Guatemalan Connection,' notes that: '... the embassies of Israel and Taiwan are being used to secretly channel North American private and state funds to the Nicaraguan counter-revolutionaries operating out of Honduras and Costa Rica.' For an indepth analysis and extensive citations see: 'Reagan's unseen ally in Central America,' *Israeli Foreign Affairs* (1) December 1984, pp 1-2.

Israel's objective of increasing its leverage over US Middle East policy seems to have enjoyed remarkable success with the Reagan Administration which has proved more politically supportive of Israel than any previous American government.⁵⁷ The most concrete manifestation of that support has been the strategic cooperation agreement itself; however, other equally important manifestations are evident in the absence of effective US sanctions when Israel bombed the nearly completed French-built nuclear reactor in Baghdad in June 1981 and then bombarded a residential sector of Beirut in July of the same year; or, when it 'reunified' Jerusalem in 1980 and annexed the Golan Heights in 1981. The American nod of approval to the Israeli invasion of Lebanon in June 1982 and Washington's quiet acceptance of Israel's categorical rejection of the September 1982 Reagan Plan, including its defiant intensification of the settlement programme in the West Bank, are further examples of such support. In addition, the consistent diplomatic backing the United States provides Israel at the United Nations, the granting of a US-Israeli free trade area, and the massive amounts of ever-increasing economic and military aid given by Washington are further indications of Reagan Administration support for Israel.

The *Washington Post* revealed an additional aspect of the benefits Israel derives from its relationship with Washington when it reported that the US was providing Israel with highly specialised intelligence data on the Arab states. According to the *Post*:

Retired Israeli Major-General Yehoshua Saguy, who was head of Israeli military intelligence from 1979 to 1983, said in an interview earlier this year that the CIA now gives the Israelis access to data from reconnaissance satellites 'not only the information but the photos themselves . . . Casey [William J, CIA Director] now says "yes" all the time.' Saguy said Casey's action was 'very wise politically' and confirmed it was a reversal from the policy of CIA Director Stansfield Turner, who left office in early 1981.

Also, Ilana Debarc, 'Dilemma in C. (sic) America,' *The Jerusalem Post*, 27 April 1984. It is interesting to note that one of Israel's most devoted supporters in Congress, Representative Howard Berman (D, California) introduced a bill in 1984, the essence of which became a provision of the fiscal year 1985 foreign aid program, that added \$2 million to the total aid package to Israel 'only for cooperative projects among the United States, Israel, and developing countries.' (See the analysis by Allan Kellum, 'Update on Congress,' *The Washington Report on Middle East Affairs* 3(8) 15 October 1984.

⁵⁷ For an analysis of the extent of US policies favouring Israel see: Cheryl A Rubenberg, 'The conduct of United States Foreign policy in the Middle East in the 1983-4 election season,' *American-Arab Affairs* (9) Summer 1984, pp 22-45. Also see Cheryl A Rubenberg, *Israel and the American National Interest: A Critical Examination*, Champaign-Urbana: The University of Illinois Press, 600 pp forthcoming, 1986.

... One official called the current CIA support 'Casey's gift,' and said it is so valuable to the Israelis that no price tag could be put on it. 'The Israelis would have every reason to do what Casey wanted [in Central America].'⁵⁸

In July 1983 the *New York Times* noted: 'American officials, in confirming Israel's cooperation in Central America, said that it was a factor in the recent improvement of Israeli-United States relations.'⁵⁹ It would be a mistake, however, to assess the Reagan Administration's extraordinary backing for Israel solely as a function of Israel's services in Central America. The President as well as his first Secretary of State, Alexander Haig, and his second Secretary of State, George Shultz (to a lesser extent also Defense Secretary Caspar Weinberger) in addition to numerous other officials in top administrative positions, have been devoted advocates of the thesis that Israel serves US interests in the Middle East as a strategic asset to American power and a bulwark in the regional/global anti-Communist crusade. In addition, the enormous influence of the pro-Israeli lobby in US domestic politics cannot be overlooked as an explanation for Washington's slavish support for Israel. In any case, Israel obviously has numerous reasons to be 'helpful' to Washington in Central America.

Finally, Israel's Central American policies have been related to its desire to decrease its international isolation. There seems to have been significant pay-off for Israel in this regard too. For instance, according to Israeli diplomat Nathaniel Lorch, there is a positive correlation between Israeli assistance and Guatemalan political support.⁶⁰ Indeed, *Guatemala has provided consistent ideological backing to Israel*, particularly on United Nations resolutions that were important to it, although following the 1980 Reunification of Jerusalem Law Guatemala moved its embassy to Tel Aviv and has not returned it. Costa Rica and El Salvador have moved their embassies to Jerusalem, however; and Guatemala may very well do so in the near future.

On the other hand, the Israeli Embassy in Guatemala City was twice bombed during 1982 and an Israeli diplomatic representative was kidnapped in El Salvador in the same year.⁶¹ It is not unreasonable to link such occurrences with Israel's support for the repressive governments in these countries. In effect, Israel risks the welfare of its

⁵⁸ Bob Woodward, 'CIA sought 3rd country Contra aid,' *Washington Post*, 19 May 1984.

⁵⁹ Taubman, 'Israel said to aid Latin aims of the US,' *op. cit.*

⁶⁰ Lorch, 'Latin America and Israel,' p 81, *op. cit.*

citizens and the local Jewish communities by its policies in Central America. In addition, as Victor Perera, a Guatemalan Jew noted, whenever a movement of national liberation gains power in one of Israel's client nations—as has happened in Nicaragua—the new leaders are quite likely to point to Israel as the 'enemy of the people'.⁶² Thus the Israeli policy of supporting governments like Guatemala and El Salvador may prove to have serious disadvantageous long-term consequences for the Jewish state.

Nevertheless, Israel apparently calculates that the short-term benefits that accrue to it—economic, commercial, political, and the multiplicity of benefits from the United States—outweigh any potentially negative future outcomes. More important, regardless of Israel's relationship with Washington, for there to be fundamental change in Israel's policies toward Central America or other Third World areas, there would have to be significant changes in Israel's Middle East policies in the direction of accommodation with the Palestinians and with the other forces in the region, as well as a diminution of the power of the military and the military-industrial complex within the Israeli domestic equation. Neither of these appear likely. Indeed, the growing militarisation of Israeli society virtually assures the continuation of militaristic policies regionally and in turn broadened international involvements. As such there is no reason to expect any decline in Israeli activity in Central America in the near future.

⁶² See the analysis by Victor Perera, 'Israel's Goliath,' *Humanitas*, 1982 (xerox from the author, no month given). Also Kaufman, 'View from Jerusalem,' p 46 who makes a similar analysis.

Undermined: the implications of mineral export dependence for state formation in Africa

We have here, in Africa, everything necessary to become a powerful, modern, industrialised continent . . . Africa, far from having inadequate resources, is probably better equipped for industrialisation than almost any other region in the world.
(Kwame Nkrumah)

Kwame Nkrumah was surely right in his assessment of Africa's resource potential for development, yet a quarter of a century after independence his dream of an industrialised and developed Africa is further out of grasp than in 1960. The question is why? What explains African countries' inability to capitalise on the continent's vast natural and human resources? More generally, what shapes any state's capacity to establish the conditions necessary for sustained gains in national welfare?

This question has become the battleground in a contest of orthodoxies. On the one hand is what might be called a 'dependency' orthodoxy; on the other is a renewed liberal orthodoxy. Though they reach totally different answers, both address the same essential question: can Third World states act to improve their standing in the international division of labour? Their conclusions provide the endpoints to a continuum of possible answers.

In its crudest form the 'dependency' orthodoxy holds that Third World states are, in themselves, irrelevant, their domestic character and international prospects being determined by their position in the international political economy. Thus, self-improvement while still in the existing international division of labour is impossible.¹ Success requires either opting out,² or a transformation of the international economic order by the 'revolutionary destruction of bourgeois capitalism and its replacement by socialist development'³ or the

imposition of a redistributive New International Economic Order. For African countries the implications are clear: underdevelopment derives from their extractive role in a European-imposed division of labour, and development requires at least a 'selective delinking . . . from the present international economic system.'⁴

Conversely, the liberal orthodoxy is best summed up by the World Bank assertion that 'while powerfully influenced by the international environment, the progress of developing countries depends even more on their own policies and initiatives.'⁵ The international economic system is not hostile nor should it be eschewed. To the contrary, all is possible—provided states choose and have the political will to pursue policies of export-led growth. (Indeed, none of the recommended policies nor their promised results 'can be regarded as unachievable since they have already been achieved by some developing countries.'⁶ Accordingly, Africa's troubles may be attributed to domestic policy failures which have been 'in many cases, decisive', although 'for most of the continent a bright economic future is within reach', if mistaken policies are corrected.⁷

Both orthodoxies suffer from the same false, and fatal, universalism. The world is not 'one' nor are LDCs as undifferentiated as both orthodoxies contend. To the contrary, 'looking out' and 'looking in' different states face dramatically different risks and opportunities. Thus, on the one hand, it is necessary to explain the quantitatively (perhaps qualitatively) better international performance of the East Asian NICs as compared to African countries' sad showings. On the other, if policy choice is all, it is essential to understand why the NICs have systematically chosen correctly, while African states have always been wrong. Neither orthodoxy, in short, asks: first, what determines states' ability to profit by opportunities offered in international economic competition and manage the risks inherent in it? and, secondly, what determines the domestic political capability necessary to

⁴ Lynn Krieger Mytelka, 'The limits of export-led development: The Ivory Coast's experience with manufacturers', in *The Antinomies of Interdependence: National Welfare and the International Division of Labor*, John G Ruggie (ed), New York: Columbia University Press, 1983, p 240.

⁷ *idem*, *Accelerated Development in Sub-Saharan Africa: An Agenda for Action*, Washington DC: The World Bank, 1981, pp 24, 16. Indeed, 'Of the policy failings that contributed to slow growth in other developing countries, all can be found in more or less chronic form in many African countries. The scope for raising growth rates by improving policies is therefore greatest in Africa.' *World Development Report, 1984*, p 2.

formulate and implement strategies for doing so, while promoting sustainable growth with equity? A new approach is needed that addresses the key analytical question directly: which states, under what conditions, will be able to advance their position in the international division of labour and so achieve significant, sustainable welfare gains for their citizens?

This paper presents one such alternative: sectoral analysis. It contends that a state's capacity to improve its relative position in the international division of labour depends on the nature of the leading economic sector through which it is linked to the international economy. Internationally, sectoral characteristics determine states' opportunities for greater gains, the risks they face and their prospects for managing them. Domestically, different leading sectors generate characteristic patterns of state-society relations, political capabilities, and even forms of the state. These largely determine states' capacity to formulate and implement strategies for advancement in the international division of labour, risk management, and development. In short, sectoral characteristics determine how much autonomous power states can exercise at home and abroad. Thus, contrary to the dependency position, the issue is not engagement in the international economy *per se*, but what sort. And contrary to World Bank claims, the issue is not merely policy choice, but the extent to which policies are possible given the underlying structure of state-society relations deriving from a country's particular sectoral connection to the international economy.

For the purposes of illustration, this paper focuses on four African states tied to the international economy via mineral production: Guinea (bauxite), Liberia (iron ore), Nigeria (oil), and Zambia (copper). In brief, it argues that such states face a bleak future. The capital-intensity of the mineral sector requires steady production at near full capacity, yet the sector is renowned for its booms and busts. Mineral extraction is thus a high stakes, high risk game in which risk management is the key to success. But because national producers cannot pursue risk management through horizontal and vertical integration as can the mineral MNCs, they must operate at a double disadvantage: they cannot manage risk effectively and yet must do battle in an international market with competitors who can. Put differently, they lack autonomous power over the terms and consequences of engagement in the international division of labour. While this suggests the need for economic diversification, however, the production characteristics of mineral extraction produce a pattern of state-society relations that

reclude it. Since the state is the 'funnel' through which mineral revenues pass, control of the state (and allocation of 'national' wealth) is the prize in the political contest. And those best positioned to win it are the mine unions and mining technocrats who man and manage the core of the economy. Thus, despite the extraordinary resources mineral extraction gives 'funnel states', they lack sufficient autonomy from mineral sector interest groups to implement the diversification strategies needed to improve their prospects internationally and promote development at home.

My presentation proceeds in three parts. The first explores the essential characteristics of the international mining sector, the specific characteristics of the international markets for bauxite, copper, iron ore and oil, and the implications of both for corporate and country producers. The second examines the domestic consequences of mineral industry dependence and, in particular, the characteristic politics of the 'funnel state'. The third summarises the evidence that these four countries' developmental problems and inability to diversify result from mineral sector dependence. Then, to put these cases in perspective, it sketches the essential features and consequences of engagement in another sector: non-vertically integrated manufacturing.

Characteristics of mineral production

The nature and requirements of mineral extraction pose unavoidable challenges to all comers, corporations and countries. The sector is marked by high uncertainty, costs and risks, and so, too, by an emphasis on risk management mechanisms. Though different types of producers may have different intentions and capabilities, their mastery of these determines their success and the profitability of the industry as a whole. Thus, before discussing specific minerals and their producers, it is essential to review the characteristics of mineral production that give the sector its peculiar structure.

The difficulties begin before production, since 'The extent, rigour and cost of the preproduction activities in mineral resource development . . . are far in excess of those required for the development of other industries.'⁸ Exploration costs are high and rising. In the early 1970s, for example, the location of new nonferrous mineral

⁸ Rex Bosson and Benison Varon, *The Mining Industry and the Developing Countries*. New York: Oxford University Press, 1977, pp 26, 31-2.

deposits cost \$200,000 to \$500,000 per discovery. Of these only 2 per cent were deemed worth exploiting.⁹ (And, note industry experts, 'No matter how thorough an exploration programme, it is not possible to define an ore body sufficiently to assure viability' when production begins.¹⁰) The costs of production and processing facilities are no less daunting. In 1951, for example, new copper capacity (mine, smelter and refinery) cost \$1,300 per ton of annual production and the expansion of existing capacity \$900 per ton. By 1970, costs had reached \$3,000 and \$2,000 per ton respectively, and by 1979 as much as \$6,000 to \$8,000 per ton for new projects.¹¹ Other minerals show similar developments, and the trend is likely to continue. (Indeed, even excluding exploration costs, total capital requirements for the 1980s may be 50 per cent more a year than in the 1970s.)¹² Furthermore, mineral production offers large economies of scale, such that the minimum economic size (MES) operation may be \$500 million and more.¹³

Apart from size, what makes mineral investments problematic are the long lead times and resultant uncertainties about price and demand. A large mining project may require eight to ten years before the first ton of ore is processed and another ten to fifteen years before it shows a profit.¹⁴ Thus, huge sums must be 'sunk' on the basis of 15–20 year projections of price and demand—a period which may include two or three recessions, major technological changes, new ore finds, etc. These are critical because the size of fixed costs make it imperative for facilities to operate at near full capacity virtually irrespective of prevailing prices. Consequently, mineral supplies tend to be inelastic: production cannot be rapidly increased when demand surges, nor decreased when it slumps. The result is the familiar boom-and-bust cycle of mineral prices.

These features explain the mineral sector's strong tendency towards oligopoly and its consequences. Oligopoly is a market structure in which a few firms produce a standardised product under conditions of high market interdependence, ie, a market in which the investment,

¹³ Raymond Mikesell, *Foreign Investment in Copper Mining*, Baltimore: Johns Hopkins University Press, 1975, p 24. For a discussion of economies of scale in mineral extraction, see Walter Labys, *Market Structure, Bargaining Power, and Resource Price Formation*, Lexington, Massachusetts: D C Heath, 1980, pp 27–8.

¹⁴ Bosson and Varon, *The Mining Industry and the Developing Countries*, p 30.

production and pricing decisions of any one firm affect the market and other producers. What makes an industry an oligopoly are high barriers to entry, and in the mineral sector they are high, indeed: few possess the know-how to find ore bodies, capital and managerial expertise to extract them, or organisation to mesh production and distant markets. Oligopoly has two faces: the alluring visage of profits and the darker one of self-destructive competition among economic giants. For, on the one hand, oligopoly allows oligopolists to extract 'monopoly rents' from consumers and so earn higher than 'normal' returns (higher, that is, than can be earned in a competitive market). Conversely, oligopoly involves great risks, since oligopolists' size and that of their investments make unrestrained competition devastating. Thus, oligopoly poses two challenges to oligopolists: as an industry, how to manage twin threats to profitability, new entrants and price competition; and, as individual producers, how to manage the risk inherent in high fixed costs and volatile prices. These explain the importance of horizontal integration, vertical integration and joint ventures in the mineral sector: they are the risk management mechanisms upon which producer and industry depend.

Horizontal integration

The requirements of oligopoly management pose a serious collective action problem. In fact, notes John Stuckey,

The classic problem confronting the firms in an oligopolistic industry is to achieve individual and collective rationality. Individual rationality requires that the individual firm perform as well as it can for itself . . . Collective rationality requires that group imposed constraints be managed to optimise the group's performance . . . (T)his amounts to the group's ability to define and maintain the collectively optimal set of competitive strategies, and to adjust the set following exogenous disturbances.¹⁵

In the mineral sector, the strategic variables requiring coordinated action are capacity additions, capacity utilisation rates, and pricing policies. Success means more stable prices, a degree of market predictability, and hence some certainty in planning large investments. Failure means a cost investment race resulting in over-expansion and the loss of monopoly rents.

Horizontal integration refers to oligopolists' efforts to manage their collective action problem in order to stabilise supply and prices.

¹⁵ John A Stuckey, *Vertical Integration and Joint Ventures in the Aluminum Industry*. Cambridge: Harvard University Press, 1983, pp 187-8.

Producers attempt to coordinate investment and capacity utilisation rates to avoid gluts and prolonged periods of depressed prices. No less important, they seek to avoid shortages and high prices. For, as Theodore Moran observes, 'no oligopoly that faces any possibility of dilution or substitution can exercise all the market power it possesses all the time. It must maintain some delicate balance between the strength that it has to demand "high prices" in the short run and the restraint it must show to keep that strength in the long run.'¹⁶

To achieve these ends, oligopolists have tried everything from *ad hoc* consultations to formal cartels. The success of their efforts turns on the characteristics of specific mineral markets and will be discussed below.

Vertical integration

Vertical integration is the essential means by which individual firms cope with high costs, risks and oligopolistic competition. Of particular concern in the mineral sector are market power shifts due to the short-run inelasticity of supply and demand. Because producers must operate at near full capacity, production cannot be cut back during demand slumps and periodic gluts are unavoidable. Under these circumstances, large buyers 'can force the producer to sell well below the high average cost needed to depreciate all the capital invested in mining, smelting and refining. To insure himself of an outlet and avoid the necessity of pricing down to the low variable cost, the producer will make a defensive investment "downstream"'.¹⁷

Similarly, production cannot be increased to meet demand surges or replace supplies lost due to mine disasters, strikes, etc, and periodic shortages are unavoidable. Thus, users need assured supplies and have a strong incentive to make defensive investments upstream.¹⁸ Put differently, vertical integration allows sellers and buyers to cover their core market and supply requirements, while shifting the risky, variable portions of each to others.¹⁹

¹⁷ *ibid.* pp 38–40.

¹⁸ *ibid.* pp 49–50. For discussion of the incentives for vertical integration in the aluminium industry, see Stuckey, *Vertical Integration*; for copper, iron and oil, see Raymond Vernon, *Two Hungry Giants: The United States and Japan in the Quest for Oil and Ores*, Cambridge: Harvard University Press, 1983, chapter 2.

¹⁹ Dennis W Carlton, 'Vertical integration in competitive markets under uncertainty,' *The Journal of Industrial Economics* 27(3) March 1979, p 207.

Vertical integration offers other advantages. First, although there are off-setting organisational costs, vertical integration reduces the transaction costs incurred in arms-length sales and simplifies conflict resolution. Second, firms gain low-cost information which lowers uncertainty, allows more precise planning and permits rapid adjustments to changing supply and demand.²⁰ The 'joint profit-maximisation' made possible by vertical integration 'leads to a higher output rate and to higher industry-wide profits, a privately and socially superior state of affairs.'²¹ Finally, since the collapse of the Bretton Woods system in 1973, transnational vertical integration has allowed firms to internalise foreign exchange rate shifts.

Producers may meet these challenges by other means, but they are inferior. One such way of managing transaction costs, market power shifts and price volatility is 'informal integration'. As Moran explains in the case of copper,

The participants agree, implicitly or explicitly, to trade in regular patterns with each other over long periods of time, and pay a premium or accept a discount from the open market price at various stages of the business cycle. . . . Thus, in periods of heavy demand, major copper producers become, in effect, allocators or rationers of scarce, low-priced copper, which they sell to their regular customers on the basis of historical buying patterns. The cost of this loyalty is later extracted from the fabricators or consumers in periods of slack demand when they must forgo the temptations offered by low prices in the open market and pay the producers' price instead.²²

Such ties serve a purpose, but offer little protection when they are most needed—and the temptation to break them is strongest. Similar problems plague the other alternative to vertical integration, long-term contracts. As Raymond Vernon and Brian Levy note, these possess a 'certain utility', since

By reducing the needs of buyers and sellers continuously to search for new partners, they hold down transaction costs and limit the costs of technical adjustments that are associated with changes in the sources of ore. But they do little to achieve another objective of ore-exporting and ore-importing enterprises, that is, the reduction of uncertainties associated with changes in supply, demand, and price.²³

²³ Raymond Vernon and Brian Levy, 'State-owned enterprises in the world economy: the case of iron ore', in *Public Enterprises in Less Developed Countries*, LeRoy P Jones (ed), New York: Cambridge University Press, 1982, p 178.

Indeed, such contracts generally deliver less than promised since 'the security is neither long-term nor of equal value to the partners.'²⁴ Thus, it is not surprising that where possible vertical integration, or a variant, joint venturing, remain the strategy of preference in the mineral sector.

Joint ventures

Joint ventures, the co-ownership of facilities by two or more firms with other, independent operations, serve important functions for oligopolistic industries and individual firms within them. Joint ventures allow oligopolies to achieve the 'collective rationality' necessary to defend monopoly rents, contain competition and fend off new entrants. First, they allow single firms and the industry as a whole to escape the dilemma posed by large economies of scale: that is, how to avoid over-expansion without building high unit cost, less than MES facilities. In fact,

A series of appropriately timed joint ventures allows the simultaneous achievement of (1) efficient-scale plants, (2) capacity growth commensurate with demand growth on an *industry* level, (3) capacity growth commensurate with growth of outlets on a *firm* level, and (4) approximate maintenance of the status quo for market shares.²⁵

Second, joint ventures reduce the number of truly independent firms in an industry so reducing the problems of coordinating and monitoring their actions. Third, they let 'competitors' collude by requiring the sharing of information about investment plans, capacity utilisation rates and prices. Furthermore, through joint ventures firms 'homogenise' their production cost structures and risk profiles, thus also 'homogenising' their needs, expectations and outlooks. This, in turn, eases oligopolistic coordination 'by prompting a consensus on collective rationality.'²⁶ Finally, joint ventures allow control of new entrants through co-option. Indeed, joint ventures with would-be challengers let oligopoly members increase their hegemony by gaining 'an input into the location and production decisions of more new capacity than they otherwise would have.'²⁷

Joint ventures offer individual firms an equally wide array of benefits. First, they make huge projects divisible. This reduces companies' risk

exposure in any given project, while it lets them participate in several different ones, and so achieve broader diversification than they could afford alone. Second, joint ventures allow firms to overcome the problem of the mismatch of MES operations at different stages of production. Third, they improve firms' standing in capital markets, because investors recognise them as 'vehicles for inefficient vertical integration, improved oligopolistic coordination, and efficient intangible asset exchange', and because they recognise the real economies associated with investment in MES operations made possible by joint ventures. Thus, joint ventures 'relieve the capital cost penalties and quantity rationing that the capital market imposes upon projects that are highly risky, require large amounts of capital, or both.'²⁸ Fourth, joint ventures give access to technical and managerial know-how that might otherwise be unavailable or costly to develop internally.²⁹ Similarly, joint ventures with local partners provide access to information about new business and political environments.

Third World producers

It is in this sectoral setting that the policies and prospects of Third World mineral producers must be evaluated. The first observation to be made is that a focus on multinational corporations (MNCs) and rationalisation is misplaced, and the sharply drawn opposition of MNCs and host countries is false. This is not to deny the impact of mining multinationals or tensions between countries and corporations. Both are real and well documented. But the differences are *distributional*. The parties may contest what is a 'fair' split of the proceeds, yet they share identical needs imposed by the sector itself: collectively, how to manage the oligopoly to maintain high and stable profits; and individually, how to manage the threat of catastrophe. Thus, if the question is whether LDC mineral producers can advance their standing in the international division of labour, then at issue is whether they can meet the sector's collective and individual challenges.

Put differently, the question is whether Third World producers can develop alternatives to corporate horizontal and vertical integration and joint ventures. The short answer is no, and thus their prospects are not good. Countries have taken control of their natural resources, but this and the resulting deconcentration of production have had

²⁸ Stuckey, *Vertical Integration*, pp 183-4 and 170.

²⁹ *ibid*, pp 162-7.

unfortunate consequences. For although the mineral industry organisation changed,

their technical characteristics did not. They remained highly capital-intensive industries, with high fixed costs and low variable costs, whose enterprises therefore were unusually vulnerable to small variations in output levels. decline in the degree of vertical integration of these industries increased exposure of buying and selling firms to such variations. At the same time although the producers and users of these various ores were no longer so numerous in numbers to allow for effective stabilisation schemes, neither were they yet so numerous as to offer the promise of an efficient open market.

Consequently, the effort has undermined producers' interests by impeding collective rationality, reducing profits, aggravating price volatility and eliminating the means of managing risk.

Third World mineral producers have, of course, paid a high price because of MNC retaliation. In the 1970s and early 1980s, MNCs sharply reduced investment in LDC resources, and instead developed deposits in 'safe' areas where they did not risk expropriation. Deprived of investment and unable to finance new operations with retained earnings because of increases in cost and MES, countries borrowed. The size and riskiness of these loans led banks to charge high interest premiums, shorten loan maturities, require lower loan to equity ratios, and demand involvement in planning and managing operations.³² As a result, countries must accept heavy debts and repayment schedules insensitive to mineral price fluctuations, national creditworthiness to the volatile fortunes of the mineral sector, tailor national priorities to lenders' requirements, and (in small states) 'subordinate virtually all . . . other development objectives to accommodate the . . . needs of a big mining undertaking.'³³ By the same token, although international engineering, management and market firms offer the technical and organisational expertise once provided

the MNCs, their services are costly and often of indifferent quality. And the MNCs still control exploration for new ore bodies and thus future development.

Though important, these problems are not determinative. Over time, they can be reduced to relative insignificance. Not so the constraints faced by Third World states because they are unintegrated producers in a vertically integrated sector and are national producers in a corporate environment. In each instance, either they cannot respond to sectoral requirements, or can employ only second-best means of doing so.

Individually, LDC producers' difficulties arise unavoidably because they are unintegrated producers. Where MNCs can 'homogenise' ore grades and production costs with investments in several areas, national producers must make do with the national endowment. Similarly, where MNCs can 'internalise' the threat of substitution by producing other minerals or synthetics, very few national producers can pursue either course. And where MNCs can 'internalise' exchange rate fluctuations, national producers cannot. But most important, unintegrated producers are exposed to all the risks of an unstable oligopolistic market. Without secure markets, they suffer the full impact of supply gluts. Furthermore, because MNC vertical integration stabilises supply and demand in much of the market, the volatility of the thinner unintegrated portion by national producers is even greater.³⁴ The only solution is long-term contracts, but as already noted, these have limitations, especially as a risk management mechanism.

Together, Third World mineral producers face the double challenge of oligopoly: how to earn monopoly rents and avoid competition. Their preferred response is the 'producer association', a hybrid intended to offer the market control of horizontal integration and the coordination enhancing features of joint ventures.³⁵ The history of such efforts is one of failure, however;³⁶ and in the management of capacity expansion, capacity utilisation and pricing, national producers confront an even more intractable collective action problem than the MNCs.

The success of a producer association depends in part on commodity specific economic variables, but mainly on political ones. As for the former, producer associations' ability to sustain 'high' prices depends on

³⁴ See Roderik, 'Changing patterns,' p 208.

³⁵ Stephen A Zorn, 'Producers' associations and commodity markets. the case of CIPEC', in *Stabilising World Commodity Markets*, F Gerald Adams and Sonia A Klein (eds), Lexington, Massachusetts: D C Heath, 1979, pp 216-19.

³⁶ Robert Pindyck, 'The cartelisation of world commodity markets', *American Economic Review*, Papers and Proceedings, May 1979, p 154.

the share of the world market supplied by member countries; elasticities of world demand, supplies from non-member countries, substitutes; the structure of the market (or degree of concentration at different stages of production); the size of stockpiles; and the cost of commodity relative to final product sales prices.³⁷ As for the latter, notes Sir Ronald Prain,

The producers must have common objectives and to a large extent political unity. They must have production costs which do not vary greatly from country to country; and they must have similar marketing arrangements. . . . There must be strict discipline in the observance of cutbacks and, ideally, only a small number of people employed in the productive industry. Finally, the producer countries should have the ability to forgo some revenue if their cutbacks lead to reduced consumption.³⁸

The former indicate the possibility of producer association succeeding, the latter whether they actually do so.

Unfortunately, success is elusive for reasons obvious to any student of collective action. The problems are greatest when producer associations are most needed or most successful, because then the interests of one member are best served by cheating. In good times of tight supply and high prices, each member is tempted to up production and shirk prices to increase market share. In bad times of excess capacity and declining prices, all are also tempted to raise production and cut prices to offset lower earnings with higher volumes or simply hold on to market outlets. In each case,

The fear that the breakdown of the cartel will make everyone worse off is a sufficient deterrent to prevent the breakdown, for any one member, in such cases rightly, believes that the threat of breakdown comes from others. The defensive response of each member, however, has the same effect as aggressive undermining by defectors.³⁹

Resistance to these pressures depends on the ability to impose sanctions sufficient to overcome individual member's impulse to cheat. It is in this regard that national producer associations are disadvantaged by comparison to corporate cartels.

That countries collude less successfully than companies is

³⁷ Adopted from Raymond Mikesell, *Nonfuel Minerals: US Investment Policy Abroad*, Berkeley: Sage, 1975, p. 28.

unavoidable consequence of national, not corporate control of production. As Raymond Vernon observes,

Instead of being able to concentrate on the common objective of high and stable profits, as a group of private oligopolists from different countries are often in a position to do, the state-owned enterprises are likely to find their ability to cooperate affected by the differing situations of their respective governments.⁴⁰

States desire national development, and aggressive efforts to increase production are often the only means available to generate funds for it. Such policies kill collusion, however. By the same token, states must consider mineral sector employment, the sector's links to support industries, and its contribution to government revenues, foreign exchange earnings and debt service. Since all of these suffer with falling demand, there are strong political pressures to cut prices to keep production and capacity utilisation from falling too far. Again, however, such measures kill collusion. Finally, attempts to establish joint ventures among national producers to capture the benefits they offer MNCs have come to naught because of differences over which country would get the projects. In sum,

the increasing role of state-owned enterprises in many raw materials industries suggests that market prices will be more volatile. . . . The increased number of firms in the market, coupled with the increased diversity of their interests arising out of the fact that they are state-owned . . . tend to reduce the probability that managed markets will prevail.⁴¹

Bauxite, copper, iron ore and oil

All mineral producers operate in this sectoral environment, but to understand the prospects of Guinea, Liberia, Nigeria and Zambia also requires understanding the markets for the specific minerals they produce. In each concentration has declined sharply as LDC producers have taken control of their natural resources. The change is obvious in oil where the seven majors' portion of crude ownership fell from 98.2 per cent in 1950 to 23.9 per cent in 1979.⁴² In bauxite production, the Herfindahl index fell from 0.266 in 1950 to 0.126 in 1973; in copper ore from 0.100 in 1950 to 0.046 in 1980; and in iron ore, from 0.047 in 1950 to

⁴⁰ 'State-owned enterprises in Latin American exports,' *Quarterly Review of Economics and Business* (21) Summer 1981, p 106.

⁴² Brian Levy, 'World oil markets in transition,' *International Organisation* 36(1) 1982, p 117

0.043 in 1979.⁴³ To analyse the implications of these changes for producers, the following sections outline the aluminium, copper, iron and oil industries under three basic headings: their 'natural' characteristics; the means by which firms have managed the challenges they pose; and LDC producers' chances of doing the same.

Bauxite

The aluminium industry has always been highly concentrated and is still controlled by just six vertically and horizontally integrated MNCs. This concentration results from high capital costs, low rates of return on investment, large economies of scale, and high know-how requirements.⁴⁴ For bauxite producing countries, the problem is that the critical barriers to entry lie downstream beyond their control. There are relatively few commercially viable bauxite deposits and their exploitation involves large-scale operations (\$500 million and up).⁴⁵ Still, bauxite accounts for just 10 per cent of total production costs, while 60 per cent are located at the reduction/refining stage.⁴⁶ It is here, too, that the scale, capital cost and know-how barriers are highest.⁴⁷ Moreover, the location of alumina and aluminium operations is determined not by location of bauxite supplies, but by the availability of cheap electricity, developed countries' national security concerns, and MNC concerns about expropriation. Finally, because aluminium demand is variable and sensitive to price changes, firms with the huge fixed investments necessary in the industry are vulnerable to market power shifts.

Given these conditions, the aluminium MNCs have been unremitting in their efforts to control the market. Individually, each has pursued risk management through vertical integration from bauxite to the consumer. Consequently, 'there is no such thing as a free-market world price for

⁴³ The Herfindahl index is the 'standard measure of industry concentration based on global output or global capacity of the individual firms producing in the indicated industry: when concentration in the industry declines, the index falls.' Vernon, *Two Hungry Giants*, pp 48-9, figures, pp 133-4. M A Adelman's oil industry figures show a Herfindahl of 0.2039 in 1950 declining to 0.1046 in 1969. *The World Petroleum Market*. ⁴⁷ Stuckey, *Vertical Integration*, pp 14-17, 78.

bauxite or alumina', and there is a 'massive excess capacity' in semi-fabrication, the result of firms' search for secure outlets.⁴⁸ Collectively, the MNCs have sought risk management and price stability through joint ventures and cartel-like organisations. (By 1979 joint ventures accounted for 66 per cent, 51 per cent and 35 per cent of world bauxite, alumina and aluminium production respectively.)⁴⁹ The resultant consortia structure of the industry makes possible the European Aluminium Producers' Association and the International Primary Aluminium Institute's successful efforts to manage capacity expansion and utilisation rates, and keep excess metal off the market.⁵⁰ Finally, the majors are helped by their small numbers and control of proprietary technology.⁵¹

As a result of the MNCs' successful oligopoly management, the aluminium industry is a model of stability in the often chaotic mineral sector. Prices have varied little and there has been little deconcentration. The number of state-owned bauxite and alumina producers has increased, but virtually all of these are joint ventures with an MNC such that 'their strategic roles in the industry are insignificant, because in an industry-wide strategic sense, they are controlled by the multinational major partner.'⁵² Indeed, with no alternative markets for bauxite or alumina, even independent firms behave as they did before.

The strength of the MNC oligopoly offers bauxite producers benefits, but imposes serious constraints. Thus, bauxite producers enjoy an uncommon stability of earnings because of the oligopoly's success. They have also been able to raise prices substantially, in part because bauxite represents such a small portion of total aluminium production costs, but largely because the oligopoly's strength allows greater flexibility than is the case in other minerals. Conversely, the cartel's strength and inter-producer differences block sustained producer gains.

These problems show best in the International Bauxite Association's⁵³ refusal to attempt cartel action. Despite controlling almost 75 per cent of the world's bauxite, IBA members are sensitive to the essential vertical links connecting their production to distant

smelters. Thus after four years of negotiation, the IBA gave up efforts to establish a common pricing formula and settled for an agreement to disagree.⁵⁴ In part this reticence grew out of fear of expanding supplies from non-member countries and the threat posed by recycling. In large measure, however, it reflected the fear engendered by the experiences of Guyana, Jamaica and Surinam who raised taxes and royalties unilaterally. Each has seen its share of investment and world production decline sharply, while Australia and Guinea, the 'safest' sources of bauxite (and both IBA members), have expanded their investment and market shares, despite higher transportation costs.⁵⁵

Guinea has benefited and suffered from its position in the aluminium industry. On the one hand, it has reaped the benefits of the stable and, until 1981, steadily increasing bauxite prices made possible by tight

Bauxite price index⁵⁶

oligopoly management. Moreover, it has also attracted new investment from MNC producers seeking safe alternatives to Caribbean sources of bauxite, and from cash and energy rich Middle Eastern countries seeking supplies of bauxite and alumina for planned aluminium smelters.⁵⁷ Conversely, successful oligopoly management by the majors and Guinea's incorporation into the market via joint ventures with dominant MNC partners means that Guinea exercises little autonomous control over its resources, its position in the aluminium industry or, by extension, in the international division of labour.

Copper

The copper industry differs from the aluminium industry—but not for the better. True, the highest barriers to entry are at the mining stage, thus giving the LDC copper producers an advantage over bauxite producers. These barriers to entry are not high, however, and the

copper industry is a 'homogeneous oligopoly with a relatively large competitive fringe' over which the majors exercise only a 'limited domination'.⁵⁸ As a result, producers compete in a high fixed cost industry without even the limited stability offered by a tighter oligopoly. (Indeed, the price volatility of copper is among the highest of any commodity).⁵⁹ The difficulty is that in the short run, the elasticity of supply is low, but the elasticity of demand is high, such that demand shifts produce sharp price and market power shifts.⁶⁰ In the longer term, however, the elasticity of supply is large because copper ore is widely distributed, there are ready substitutes and a large secondary market. Thus, though price booms occur, copper offers no prospect of sustained high prices, but instead periodic busts.

The copper MNCs have been obsessive, and unsuccessful, in their efforts at oligopoly management. Individually, firms have pursued vertical integration, but because of low barriers to entry at all stages of production have achieved little security. Moreover, because mining is the critical stage of production, the copper MNCs have been less able than the aluminium majors to retain market control in the face of nationalisation. They have developed new sources of supply, but since they control few market outlets, the new production merely depresses prices throughout the industry. They have even tried diversification via joint ventures in the aluminium industry, but still in recent years virtually all have been bought by outsiders. Collective efforts have been no more successful. As for prices, 'No scheme yet propounded has introduced a long-term measure of price stability, at reasonable prices, into the copper industry. Indeed, most collusive agreements have retreated into acrimony and disbandment, only to be followed by damaging slides in the copper price.'⁶¹

Through interlocking directorates, joint ventures, debt financing linkages, and sales agency agreements, private producers and consumers have achieved limited coordination.⁶² These have damped the worst effects of demand and price volatility, but no more.

⁵⁸ Labys, *Market Structure*, p. 42.

⁵⁹ Only zinc (30 per cent) and lead (29 per cent) surpassed copper, and neither is traded in volumes remotely approaching copper. Sir Ronald Prain, *Copper: The Anatomy of an Industry*, London: Mining Journal Books, 1975, pp 100-1.

⁶⁰ Labys, *Market Structure*, p. 83.

⁶² David G Becker, *The New Bourgeoisie and the Limits of Dependency: Mining, Class, and Power in 'Revolutionary' Peru*, Princeton: Princeton University Press, 1983, pp 76-7

The trend toward dilution in copper is unmistakable. Since World War II, the oligopoly has expanded from seven to at least twenty major producers.⁶³ This dilution results from new ore discoveries, development of new technologies, backward integration into mining by refiners and fabricators, and investment in copper by firms mining other minerals. No less important, Peru, Chile, Zaire and Zambia (who account for 50 per cent of internationally traded copper) have nationalised their mines, adding four new, independent producers to the industry. Thus, where in 1948 the top seven (all private) controlled 70 per cent of world production, they controlled less than 50 per cent in 1977, and of this much came from state owned enterprises.⁶⁴

Deconcentration has hurt the producing countries. They profited from the price surge of the late 1960s and early 1970s, but since have suffered the lowest prices in fifty years. In part, low prices reflect low demand in the industrial economies. In large measure, however, the reasons 'clearly lie on the production side of the equation. . . . (P)roducers . . . have behaved in a short-sighted and highly disruptive manner—refusing to adjust production rates to consumer demands and creating a huge stock of surplus copper which has undermined the market.'⁶⁵

These difficulties derive from the nationalisations of the past decade. On the one hand, the loss of supplies led MNCs to seek new sources in 'safe' areas, adding to world-wide productive capacity despite falling demand. On the other, the new state-owned enterprises also increased production to generate government revenues, expand employment and service the debt incurred buying out the MNCs. Thus, the industry today adjusts 'less rapidly to price signals triggered by demand shifts, with over-production reflected in prolonged periods of relatively low prices.'⁶⁶

Producer countries have managed the risks of the copper industry even less well than the MNCs. Individually, they cannot reap the limited benefits of vertical integration enjoyed by MNCs, but instead occupy the unenviable position of unintegrated producers in an unstable market. Similarly, they cannot diversify into other metals. Collectively, producer country efforts at oligopoly management have also fallen short of the MNCs'. The Intergovernmental Council of Copper Exporting

Countries (CIPEC) suffers the weakness of the copper oligopoly and the problems of coordinating state actors. Because of the one, even successful collusion holds no promise of sustained higher prices.⁶⁷ Indeed, 'Paradoxically, the stronger a cartel CIPEC can create . . . , the weaker its position will become', as higher prices encourage non-members to raise production, more scrap to enter the market, and substitution to diminish future demand.⁶⁸ On the other hand, differences among member countries limit the prospects for price stabilisation.⁶⁹ Low cost producers such as Chile resist production cutbacks to raise prices because even at prevailing prices they turn a profit. Countries such as Zambia that depend on copper export earnings cannot afford to reduce production, whatever the long-run benefits. Thus, the CIPEC countries

may have to finance their own national development out of highly fluctuating, highly unpredictable, and perhaps even declining real earnings. They may come to inhabit the worst of all possible worlds: a fast weakening international copper oligopoly, with themselves relegated to the position of a spill-over market on to which has been shifted the burden of market uncertainty and instability for the entire industry.⁷⁰

Zambia demonstrates the problems of unintegrated producers in the deconcentrating copper market. It has suffered the same price fluctuations as all other producers. But its actual experience has been even more unstable.

While Zambia's import bill almost doubled between 1970 and 1980,

export earnings in 1980 were below the 1970 figure.⁷³ Government revenues from copper fell precipitously during the same period, coming to rest at zero in 1978,⁷⁴ and the rate of GDP growth (of which copper is the dominant element) fluctuated between +9.8 per cent and -13.7 per cent per year.⁷⁵ There has been virtually no new investment in copper nor any major mine maintenance or renovation, despite serious problems. Indeed, while copper investment in 'safe areas' such as the Philippines, Namibia, Australia and Canada has exceeded the recent Western average, investment has fallen in Zambia.⁷⁶ Direct control of copper production has proved a Trojan horse, as Zambia is today subject to amplified versions of the risks of the copper industry with still fewer means of managing them than before.

Iron ore

International trade in iron ore is quite new. The existence of quality ores in Europe and the US, plus high transportation costs meant that until the 1950s most steel mills were supplied by local mines. Three changes transformed this pattern. First, new steel producers without domestic sources of ore (notably Japan) took important positions in the industry. Second, traditional steel producers exhausted high-grade domestic sources of ore. Third, and making a shift in supply possible, shipping costs tumbled.⁷⁷ Australia has been the greatest beneficiary of these changes, but LDC iron ore production has grown, too, from 12.2 per cent of world output and 36.4 per cent of world exports in 1955 to 30 per cent and 45.6 per cent respectively in 1975.⁷⁸

Because of the structure of the steel industry, the rise in LDC ore production has not translated into equally great gains for producing countries. Even by mineral sector standards, iron ore operations are

ensive. Mines average 10–15 million tons per year capacity (and go 50 million) at costs of \$75–125 (1975) per ton of annual production, so that new operations may cost \$1 billion and up. Moving this amount of ore also requires special rail and port facilities, which may add several hundred million dollars to the total.⁷⁹ Such costs mean foreign financial participation and often consortia financing by several companies and banks. At the same time, they make investors unwilling to consider new mines without assurance of secure markets. Steel-makers are no less dependent on their suppliers, since they too require high capacity utilisation, and ore constitutes one of the most important production costs.⁸⁰ Moreover, ores are not interchangeable. Once steel-makers chose a supplier, they are committed for the long term, while the supplier, too, has few other buyers.⁸¹ In sum, the steel industry, too, suffers an unstable balance between buyers and sellers in which market power shifts with supply and demand.

To cope with these risks, producers and consumers of iron ore have formalised virtually the entire market by one means or another. Additionally, the industry was organised in national cartels with steel companies in each country integrated backwards into mining. As trade increased, this pattern spread such that in 1960, more than 40 per cent of internationally 'traded' ore moved within firms, while another 19 per cent traded under long-term contracts (often to steel companies owning shares in the mine).⁸² This pattern altered as nationalisation stripped away captive mines, but the importance of long-term ties between suppliers and consumers remains. (There still is no arms-length market for iron ore.) Today these essential ties are assured through joint ventures (often with LDC partners) that guarantee supplies to investors, and long-term contracts of 20 years or more.⁸³ European and Japanese steel-makers boost the security provided by both with government-licensed joint participation in foreign mines and joint ore buying policies (which also aid oligopoly management).⁸⁴ Forbidden such

abys, *Market Structure*, pp 267–8. To put this in perspective, in 1972 gross domestic investment in Liberia was \$118 million—10 per cent of the cost of a new MES iron ore operation (p 182). strategies by anti-trust laws, American steel-makers have sought new captive mines in 'safe' areas to replace those lost through expropriation.

The changes have reshaped the industry's formal structure, but have not affected its fundamentals. The most visible change in the last decade is the appearance of state-owned mines which now account for more than 40 per cent of internationally traded ore.⁸⁵ Still, the level of concentration remains high: the four largest ore-exporting firms supply 53 per cent of all internationally traded ore and the four largest importers buy 69 per cent of it. Thus, the requirements of survival remain and, as Raymond Vernon and Brian Levy note, 'any given seller of iron ore, unless strongly linked to some specific buyers, is exposed to a high degree of market risk.'⁸⁶ Indeed, greater control of iron ore production has done little to up countries' profits or their say in the industry, and may have hurt both. Without ties to foreign buyers, State-owned enterprises may 'be less responsive than captive mines to both short-term and long-term changes in international ore demand' and in the event of changes 'may be slower to adjust production levels than their private counterparts.'⁸⁷ Yet because the MNCs have found new sources of supply, such adjustments are more essential today than in the past, lest unintegrated national producers glut a market in which they lack secure outlets. Producers have formed an Association of Iron Ore Exporting Countries, but it is no more than an information clearing house.⁸⁸ Widespread ore reserves and stagnant demand preclude efforts to raise prices, and differences among members block defence of a floor price.⁸⁹ Producer countries thus continue to have only limited prospects in an increasingly risky market.

Liberia demonstrates the costs and benefits of iron ore export dependence. By comparison to copper, iron ore prices have been relatively stable, though not as stable as bauxite prices.

The resulting swings in Liberia's export earnings have produced fluctuations in GDP growth rates from +7.4 per cent to -15.1 per cent per year. Like Guinea, Liberia lacks the autonomous power to affect iron ore prices and/or prices and/or volumes. Unlike Guinea, however, Liberia experiences less price stability because of the relatively weaker structure of the market.

Oil

In oil there are barriers to entry and economies of scale in exploration, production, refining and marketing. Traditionally, the highest barriers have been located at the production stage, and those with access to crude have built vast reserves to deny supplies to potential competitors.⁹² Possession of cheap crude also makes downstream control easier.⁹³ As in other mineral industries, oil production and processing facilities involve large and lumpy investments which make secure market access essential, lest dips in demand force prices below the minimum needed to meet high fixed costs. Conversely, refiners and marketers of oil require secure supplies in times of high demand or shortages, lest they too be unable to cover costs. In short, in the oil industry as well, shifts in supply or demand may cause sharp reversals of market power.

Given high risks and potential profits, it is not surprising that the majors devote themselves to risk and oligopoly management. As for the first, individual firms internalised market power shifts by integrating from

¹ *ibid.*

well-head to gas pump. They also diversified their sources of supply and markets to minimise the damage that might be inflicted by problems in any one. As high oil prices made other sources of energy attractive, they bought coal and uranium mines, and invested in solar power. And where the size and lumpiness of such investments might stymie single companies, joint ventures have made them possible. Moreover, these joint ventures also reduce the 'vulnerability of individual firms to the negotiating pressures of governments'.⁹⁴

Individual firm's ability to manage risk and profit hugely depended, in turn, on the collective ability to forge horizontal linkages for managing the industry as a whole. To exclude new entrants, prevent the dilution of profits, and contain competition and cheating, the majors established mechanisms for coordinating production, marketing and prices. Initially, they depended on formal agreements specifying company production quotas by areas and market shares by company, market, product and channel.⁹⁵ Policing compliance was made possible by *Platt's Oilgram* which published accurate production statistics and prices. Even after suspension of these agreements during World War II, the majors maintained oligopoly management through joint ventures in production, refining and marketing. By these means the majors retained control until the late 1960s when events largely beyond their control metamorphosed the oil industry.

Two forces lie behind deconcentration: the rapid post-war rise of demand for oil and the transformation of producing countries. Between 1950 and 1960 the rate of oil consumption increased 7.5 per cent per year, and between 1960 and 1970 8.0 per cent per year.⁹⁶ With such growth, the majors worried less about dilution. The barriers to entry fell as expanding markets enticed new firms to explore for oil, and expanding supplies led others to build independent refineries.⁹⁷ By the late 1960s, these 'independents' had markedly reduced the majors' control. But because they lacked a full panoply of risk management mechanisms, the independents were easy targets for countries seeking to increase their control of production and proved a good lever for shifting the structure of the industry as a whole.⁹⁸

⁹⁸ See Edith Penrose, 'The development of crisis,' in *The Oil Crisis*, Raymond Vernon (ed), New York: W W Norton, 1976.

This period also saw the culmination of two developments in producing countries. First, they began to exert their independence, particularly as it concerned the control of oil. Second, standardisation of production technology and a growing cadre of industry professionals meant they could run oil operations themselves. Thus, in the early 70s, market conditions favoured the holders of crude, the majors' ability to manage the industry was eroded, and for the first time the producing countries possessed the economic and political capacity to take over. Since then, they have asserted their control of production and 'nibbled away' at the majors' control of marketing, expanding direct sales of crude from just 8 per cent of internationally traded oil in 1973 to more than 40 per cent in 1980.⁹⁹

This transformation did not bring the expected benefits. To the contrary, notes Brian Levy, though it broke traditional patterns of vertical integration, it did not eliminate 'the pressures that had led to vertical integration in the first place. The imbalance between a market structure that generates an incentive for firms to integrate and a pattern of control that has made integration difficult to achieve, has added to the turbulence of world oil trade.'¹⁰⁰

The national producers, not the majors, have borne the brunt of the new instability, and precisely because they lack the capacity to take defensive measures. With diversified sources of supply, the majors could sustain a portion of their integrated system, and with control of markets they could broker the sale of OPEC oil. At the same time, they developed new, if expensive, sources of crude, the costs of which were made bearable by OPEC's success in raising prices.¹⁰¹ As a result of increased exploration efforts, OPEC's share of world oil production has fallen from its 1967 level of 67 per cent to 40 per cent today.¹⁰² With these new supplies, the majors have rebuilt much of their vertically integrated system and are again capable of internalising at least a portion of market risk. Not so the national producers who have been thrown back on OPEC.

OPEC has not been up to the challenge. Since its inception in 1960, OPEC has gathered information for members, and provided a forum

Levy, 'World oil markets in transition', p 113.

ibid., p 114.

In 1978, 48,513 wells were drilled in the US and just 2,668 in all non-OPEC LDCs combined, although on average, non-OPEC LDC wells yield 300 barrels per foot drilled and American wells only 15-20. Vernon, *Two Hungry Giants*, pp 34-5.

for debate and occasional decision-making. But it is incapable of the oligopoly management critical for success in the oil industry. The problem is that its member governments possess different needs and perspectives on collective priorities, and guard their sovereignty jealously. Thus, OPEC

does not set the prices that individual countries can charge for their crudes . . . has never controlled its members' production, nor . . . achieved an agreement on market shares. It has no mechanisms for detecting members who deviate from the reference price. . . . Nor can it impose sanctions on members who fail to keep the price of their crude in line with the prices of others.¹⁰³

Output and pricing decisions remain, notes Edith Penrose, 'firmly in the hands of individual national governments' so that 'OPEC as such has little influence on the price or supply of oil.'¹⁰⁴ As a result, individual countries face the market alone, a market over which they can exercise no effective control, but one now more fraught with risk than ever.

Nigeria demonstrates these problems as well as any country in the world. Like other producers, it has ridden the rapid rise, and since 1981, fall of world oil prices.

Oil price index¹⁰⁵
(1980 = 100)

1965	70	71	72	73	74	75	76	77	78	79	80	81	82	83
7	7	9	10	13	39	32	34	39	38	59	100	111	99	86

Nigerian oil production took off in 1968–70 with the end of the Biafran War. Export volume rose steadily until 1974 after which it has fluctuated erratically. Unit value increased from 1970 until 1980 after which it plunged with the international recession and oil glut.

resultant fluctuations in export earnings have led to wild changes in public revenues and other macroeconomic variables (GDP growth has varied between +30 per cent in 1970 to -5.7 per cent in 1981),¹⁰⁷ albeit at previously unimaginably high levels of aggregate national income. With the current glut in oil supplies, many buyers have taken long-term contracts for Nigerian oil, forcing Nigeria to discount oil and exceed OPEC production quotas to survive. At the same time, many oil companies have reduced exploration in preference of other areas.¹⁰⁸ Thus Nigeria, like Zambia, must live with the consequences of the collapse of oligopoly management: price and production instability.

State control vs diversification

Even in the poor prospects and high risks of dependence on mineral production, diversification is imperative for Guinea, Liberia, Nigeria and Zambia, and all four have declared it a priority. Yet in each case dependence is rising and alternatives declining. The reason is the structure of the mineral sector: it generates a characteristic form of the economic, social, set of interest groups, and pattern of state-society relations that preclude diversification, and exaggerate the worst consequences of mineral sector dependence.

In mineral economies the state is the money-maker, the funnel through which the proceeds of extraction are poured into national projects, the allocator of national wealth. Thus, it is not surprising that the fiscal regime applied to the mineral sector is a central concern in Guinea, Liberia, Nigeria and Zambia. Nor is it surprising that even where mineral MNCs have not been nationalised, these states have levied royalties and taxes to capture virtually all the profits, or have opted for joint venture deals giving them equity participation.¹⁰⁹ In

Zambia completed nationalisation of its copper industry in 1975. Cobbe, *Governments and Mining Companies*, pp 242-3.

doing so, each gained previously unimagined resources and raised expectations of the state as prime mover in a process of 'bonanza development'¹¹⁰ involving diversification through industrialisation financed with mineral sector revenue.

The mineral sector's role in Guinea, Liberia, Nigeria and Zambia is striking. Guinea is the third largest bauxite producer in the world and a major producer of alumina. Mining accounts for 96 per cent of export, and dominates the domestic economy and government revenues.¹¹¹ In Liberia, iron ore accounts for 70 per cent of total exports and, at least until 1973, accounted for more than a third of GDP and on average 18 per cent of government revenues.¹¹² In 1980, oil made up of 96.5 per cent of Nigeria's total exports, and in 1978, generated 40 per cent of GDP and 60 per cent of government revenues—revenues 800 per cent greater than in 1970.¹¹³ In Zambia copper accounts for 95 per cent of total exports and 35 per cent of GDP. Until the fall in copper prices, mining also contributed 45 per cent of government revenues.¹¹⁴ Moreover, in none of the four are there strong backward linkages to other sectors of the economy. Thus, as Meyer and Pearson note of Nigeria, the mineral sector's contribution to development 'depends now more than ever upon governmental decisions guiding the use of resources provided by this extensive, nonrenewable asset.'¹¹⁵ But hope: for 'bonanza development' are unfounded, for they ignore the special nature of the funnel state.

The problems derive from the mistaken equating of state resources with state strength. Of course, state-led diversification and development require resources. They also require the autonomy and capacity to re-order the distribution of economic and political power between state and society, and among non-state actors. Government resources are usually taken as a measure of this, since having them generally presupposes the administrative and coercive capability to extract them. This is not so among states dependent on mineral

¹¹⁰ The phrase is David Becker's, *Limits of Dependency*.

production, however; for their resources are windfalls, and they but the funnel for their distribution, not their makers. Some changes do occur: the state becomes a more significant actor and the mineral sector eclipses once central sectors of the economy and the elites tied to them. These changes, however, do not necessarily improve the state's autonomy to formulate diversification strategies or its capacity to implement them. Instead, the lure of mineral resources increases efforts to control the state, forcing leaders to use political survival tactics that reduce both. In Guinea, Liberia, Nigeria and Zambia these problems show in the growth of sprawling but flabby bureaucracies, the intensification of political conflict over access to the state, the adoption of autonomy reducing means to manage these pressures, and the ability of mineral sector interest groups to divert resources to themselves and away from development in other sectors.

Mineral sector resources make possible a huge expansion of public employment; this, however, often diminishes rather than augments state capacities. Though public sector employment on average accounts for 27 per cent of non-agricultural salaried jobs in LDCs, it accounts for 71 per cent, 60 per cent and 53 per cent in Zambia, Nigeria and Liberia respectively. In Zambia, public sector growth also accounted for 55 per cent of all new employment from 1966 to 1973, while in Nigeria public employment grew 15 per cent per year from 1976 to 1980.¹¹⁶ In Guinea, functionaries manage every aspect of daily life. In all four countries, public sector employees enjoy relatively high incomes and benefits denied most of the population. In part, public sector growth reflects demand for state services to meet unmet needs and, in Guinea, an ideological commitment to state control. It also reflects the use of state resources for patronage and the co-optation of opposition groups. Either way, governments' recurrent costs have risen sharply. So has public employees' ability to defend their privileged position even in times of crisis.¹¹⁷ (For example, as Zambia struggled with the copper price collapse between 1975 and 1978, employment in the private sector

¹¹⁶ World Bank, *Accelerated Development*, pp 40-1 and *idem*, *World Development Report*, 1983, p 103, and *Africa Report* 20(2) March-April 1978, p 27. Figures are unavailable for Guinea, but the absence of a private sector and state dependence on bauxite earnings suggest a similar pattern.

¹¹⁷ As Philip Daniel notes of Zambia, although it applied in all four cases, public employees 'became an increasingly significant interest group . . . they were relatively privileged in terms of incomes and fringe benefits, and to maintain that position required . . . continued increases in government revenues and containment of consumer price rises', both of which the government undertook at great cost to other needs. *Africanization, Nationalization and Inequality: Mining Labour and the Copperbelt in Zambian Development*. Cambridge: Cambridge University Press, 1979, p 20.

fell by 18 per cent (21,590 jobs), but public sector employment (where salaries were 60 per cent higher) increased by 6 per cent (13,70 jobs).¹¹⁸ Thus, these bureaucracies cannot plan or promote 'bonanz development', but divert scarce resources from the task and create powerful interest groups often opposed to it.¹¹⁹

The problems of the public sector typify the dilemma facing funnel states. On the one hand, state control of the national wealth makes access to the state the aim of political and economic activity. This in part reflects a colonial heritage in which entrepreneurial avenues were closed to Africans, while the civil service and later politics gave an entrée to the colonial administration. It is also an outgrowth of mineral sector dependence which makes the state the source of wealth. Thus Stephen Holpe posits a 'Liberian premise': 'Unless you are in public political or Governmental office, your access to channels which bring financial and economic wealth is permanently closed.'¹²⁰ Similar 'premises' fit elsewhere, too. 'The principal social distinction within Guinean society,' notes one text, 'is between those who are in position of public power and authority and those who are not.'¹²¹ In Nigeria observes Claude Ake, 'the state appears to intervene everywhere and to own virtually everything, including access to status and wealth. Inevitably, a desperate struggle to win control of state power ensues: since this control means . . . being all-powerful and owning everything. Politics becomes warfare, a matter of life and death.'¹²² The Chairman of Zambia's Congress of Trade Unions defines politics as 'the conduct of public affairs for private advantage'.¹²³

It is the obverse of this competition for control of the state that poses the dilemma: funnel state leaders must adopt survival tactics which limit autonomy, divert resources from diversification and development, and reduce the capacity to undertake the social transformation they require. Guinea sought to transform the economy through state control. But the bureaucrats could not manage it productively, while the size and power

he bureaucracy forced Sékou Touré to manipulate it constantly to stay in power. The administrative shuffles, regular purges, tight rein on decision-making, and dependence on family served well in that capacity, but left Guinea more dependent on bauxite than ever.¹²⁴

In Liberia, the rise of mining finalised a political realignment underway since Firestone Rubber's arrival in the 1920s. It ended the old family hegemony based on small, financially weak plantations, shifted power to state leaders who wielded monies extracted from foreign corporations. Presidents Tubman and Tolbert manipulated access to the state to reinforce factional divisions, make the middle classes dependent on that access, and so limit 'any attempt to challenge the system, or develop a pressure group against the government.'¹²⁵ As in Guinea, such machinations made diversification impossible and left the state dependent on mining. The military coup merely changed the identity of those directing the funnel.

In Nigeria, oil revenues shifted power from export agriculture elites to the states to the federal government and central decision-makers and technocrats.¹²⁶ The size of the oil 'bonanza' raised competition for access to the state to fever pitch. Leaders responded by co-opting some potential opponents and paying off others (as the scale of 'official' corruption indicates). Such policies slowed diversification and destroyed many of the sectors which might complement oil. Leaders have also failed to manage competition for access to the state. The result has been a revolving door of governments, each most interested in its share of the 'national' wealth. Oil dependence remains.

In Zambia, the windfall profits of independence and separation from northern Rhodesia initially let President Kaunda 'co-opt support through an expanding base from which to allocate economic rewards.'¹²⁷ But by 1968 he faced serious resource constraints and political pressures. Nationalisation eased both. Kaunda has since maintained control by concentrating power in his own hands and making himself the arbiter among contending forces. He often reshuffles government posts to achieve factional balance and avoid attacks from

below, and has encouraged a pervasive patronage and spoils system.¹²⁸ This has kept him in power, but destroyed government capability, reduced autonomy, raised costs, and diverted resources from diversification. Copper remains critical.

In short, leaders' survival strategies have decreased state capacity and autonomy, thus slowing diversification and reducing its likelihood.

The problems of autonomy lost are exaggerated in Nigeria and Zambia where state-owned enterprises (SOEs) formally incorporate the state and the mineral sector. This may severely reduce SOEs' ability to pursue rational production, manpower and pricing policies, raise capital, or maintain existing facilities.¹²⁹ Conversely, SOEs offer access to the state and its resources. Thus, in Nigeria and Zambia it is not surprising that the mineral SOEs and SOE-state relations have become an arena of conflict, for at stake is control over the actual or potential surplus of the SOE and much of the nation's wealth.¹³⁰ Many actors are involved—top leaders, ministers of finance, labour, and economic development, parliamentarians with regional interests, and representatives of other sectors—but best positioned to hold the high ground are those who manage and man the mineral SOEs.

This raises the final aspect of mineral sector dependence: the political and economic power of interest groups spawned by the mining sector. In all four countries mineral sector technocrats occupy privileged positions, while in Guinea, Liberia and Zambia the mining unions do as well, although they differ substantially on this score.¹³¹ Miners were among the first workers to unionise in Guinea, Liberia and Zambia, and because of the sector's centrality and the miners' numbers, these unions also became the core of nationalist organization in Guinea and Zambia. Sékou Touré, for example, began as a mine organiser in Guinea's emergent bauxite industry and then successfully channelled the energies of the 1953 general strike into the Parti Démocratique de Guinée.¹³²

¹³¹ Nigerian oil field workers are also unionised, but because of the nature of the technology are too few in number to be politically significant. See Ubeku, *Industrial Relations in Developing Countries*, p 47.

¹³² *Area Handbook for Guinea*, p 34 and Kaba, 'Guinean Politics,' p 28.

espite this, however, Touré and his military successors have succeeded in breaking union autonomy and subordinating labour to the state.

By contrast, the Zambian Mineworkers' Union fought for independence on equal footing with Kaunda's United National Independence Party (UNIP), and has maintained its autonomy as a labour organisation.¹³³ Consequently, the government and union have long been at loggerheads: the one seeks better wages, working conditions and benefits—a bigger piece of the copper cake; the other wage restraint and greater labour productivity to minimise recurrent budget expenditure increases and maximise the mineral sector surplus available for investment in diversification. To achieve its ends, the state had adopted strict labour control measures and sought to co-opt union leadership. Neither coercion or co-optation has worked, however. Thus, on the one hand, notes Philip Daniel, Zambian copper sales suffer because of 'unsuitable levels of labour costs per ton',¹³⁴ while the wage standards set by the mining industry raise labour costs in other sectors, making it impossible for them to compete internationally.¹³⁵ On the other, since government must pay these high labour costs and cannot lay off workers or close high-cost mines, it also cannot promote other sectors.

In addition to the challenge posed by miners is the more intractable one of managing the mineral sector technocrats and other middle-class interest groups supported by mineral sector revenues. In Zambia, for example, the allocation of mining sector labour has shifted steadily away from production and into highly paid bureaucratic employment.¹³⁶ The cost of high salaries and generous benefits for this swollen cadre of white-collar mining bureaucrats is added to Zambian copper costs without any compensatory increase in productivity. Despite the resulting damage to the national budget and exports, the state can do little to limit either, not least because civil servants now dominate UNIP and Kaunda's circle of advisers.¹³⁷ Indeed, note

Markakis and Curry, these middle-class perquisites are both 'a necessary condition for the existing alignment of political forces' and the 'limiting factor confronting the efforts of the political leadership to reduce Zambia's external economic dependence and to promote continued development'.¹³⁸

These problems are still greater in Nigeria where the size of the national budget and public sector make the possibilities for excess greater, too. The government currently employs more than 50 per cent of those working in the modern sector and public sector unions have been extremely effective in promoting their interests. Indeed, the wage differential between top government employees and unskilled workers is today 17:1, five times the British equivalent (and that before taking benefits into consideration).¹³⁹ The developmental consequences of this show clearly in the Nigerian budget which devotes a disproportionate share of total outlays to recurrent expenditures on salaries or investment in amenities for civil servants, not development. In 1978, for example, defence and education accounted for 31 per cent of recurrent federal expenditure and 18 per cent of the capital budget, while education absorbed another 20 per cent of state budgets. Most of the huge sums involved have gone for car loans, middle-class housing, middle-class salaries, etc, for 'a gigantic ageing welfare roll of warriors' and 'a greatly expanded teaching profession'.¹⁴⁰ Defence spending has bought little national security, while spending on teachers' amenities has often come at the expense of educational facilities. And in neither case has the essential aim of diversification been well served. Moreover, as oil revenues have fallen, these and other well placed interest groups have maintained their stranglehold on the budget, thus shifting the costs of oil dependence to others.

Conclusion

This paper asks why despite vast natural resources, the governments of Guinea, Liberia, Nigeria and Zambia have been frustrated in their efforts to attain Kwame Nkrumah's dream of a developed and prosperous Africa. It argues that to answer both this and the more general question of which states, under what conditions, will be able to

to their positions in the international division of labour and so sustainable welfare gains for their citizens requires examining the role of the leading economic sector through which states are integrated into the international economy. Considered in this light, the past successes and bleak prospects of Guinea, Liberia, Nigeria and Zambia do not surprise: they are the unavoidable consequence of mineral export dependence. Internationally, these states face a high stakes, high pressure environment in which they lack autonomous control over both the terms and consequences of their engagement. For them, advancement in the international division of labour demands economic diversification. Ironically, however, hope of diversification is dimmed by the form of the state, pattern of state-society relations, and interest group structure which all four possess as a result of mineral sector dependence.

Even careful examination of one sector offers no test of the validity of the claims of sectoral analysis. Thus, by way of conclusion, let us consider the consequences of involvement in a very different sector: vertically integrated manufacturing (eg, textiles, footwear, etc.). Unlike the mineral industries, these lack barriers to entry and are open to all-comers. There are few economies of scale and the technology is standardised. Not market control, but market competitiveness—price, flexibility, quality control, ability to meet customer needs—are the keys to success. As a result, countries and their firms that enter these industries may face extreme international competition, but unlike their counterparts in the mineral sector can compete on an equal footing with all other contenders. How successfully they are able to do so, however, depends on the capacity of the state to pursue policies that enhance their firms' ability to respond to the market. They need foreign exchange and foreign trade policies that do not impede access to capital, technology and inputs or distort market competition.

And to pursue them, they must have the autonomy from domestic interest groups necessary to be able to subject the economy to the hard and cruel winds such policies also let into the international market. In virtue of the characteristics of the non-vertically integrated manufacturing sector, such states are far better positioned to pursue economic advancement than mineral exporters. Because most economic activity takes place outside the state, they are not an asset tied to the state as are funnel states. Similarly, since neither the state nor the firms are directly involved in economic activity, they are able to act as regulators of the national economy, not players in it. This autonomy

from both the economy and economic interest groups is greatly enhanced by the production characteristics of industries in this sector. On the labour side, these industries are notoriously hard to organise because they are divided into innumerable small firms and factories. Thus, states do not face potent unions able to demand higher wages or protectionist measures. As for capital, these industries involve large numbers of small entrepreneurs, all competing with one another and again not easily organised. Moreover, because they are small and oriented to the international market, these firms fear protection since they would lose their markets and be unable to compete successfully with larger firms for control of the domestic market. Thus here, too, the state is free from pressure.

To return, then, to the battleground of orthodoxies, it is clear that both are right, wrong and insufficient. As for the dependency orthodoxy, it is true that states' structural position in the international political economy is important. It is not international engagement *per se* that matters, however; it is what sort of engagement that determines where states stand and what their prospects for advancement are. By the same token, the World Bank is right that correct policies are essential to success in international competition, but their implementation requires more than 'political will'. It is not policy choice alone, but the extent to which the underlying structure of state-society relations gives leaders the capacity and autonomy to pursue them. The strength of sectoral analysis lies in the link it forges between these two alternative approaches. It offers both a parsimonious categorisation of types of international engagement that permits powerful assertions about states' prospects in the international division of labour, and equally powerful assertions about the autonomy and capacity of the different states depending on the specific type of engagement they have.

Errata

In Cosmas Desmond's article, 'Sanctions and South Africa', which appeared in **Third World Quarterly**, January 1986, the sentence containing the phrase 'not possible', on page 97, paragraph one, should read: 'The complete isolation of South Africa is, therefore, not impossible on economic grounds.'

In Lewis Taylor's article, 'Peru's Alan Garcia: Supplanting the Old Order', in **Third World Quarterly**, January 1986, the clause containing the phrase 'APRA will not most likely', on page 131, paragraph two, should read: 'APRA will most likely abandon its newly adopted dove-like posturing and resort to the more traditional methods of pistol, knife and club.'

Third World Quarterly regrets these errors.

Depression of export commodity prices of developing countries: what can be done?

The export prices of the developing countries' commodities are at their lowest point since 1980-1. In real terms, the prices of non-oil products are lower than at any time since the Second World War. And no end is in sight to the decline—for either oil or non-oil products—in view of the uncertain economic outlook, and therefore import demand, of the industrial countries, and other factors. These are: the depressing effects of large debt service payments on the import capacity of developing countries; the presence on primary producers to increase their sales in order to meet their financial obligations, even though their markets may be increasing only slowly, and the excess capacity in some major primary goods.

Falling commodity prices have exacerbated the debt crisis by raising the real debt burden. The debt crisis in turn has contributed to the fall in export prices and the aggregate export revenue of the debtors; this is because of the relentless growth in export volume required under the dominant theory of 'export-led' adjustment, which does not appear to have distinguished sufficiently between primary products and manufactures.

No international action to stem the decline in commodity prices or to provide adequate compensatory finance for the loss of income had been undertaken and no overall plan is under way to improve the situation. An indication of the gravity of this situation is the suspension of purchases by the International Tin Buffer Stock in late October 1985 and a consequent fall in the tin price which has affected developing countries across three continents. While this event cannot be taken as proof of the inherent impossibility of commodity management—just as occasional business failures are no proof that business management is

The author is Economic Adviser to the Bank of Credit and Commerce International SA. Views expressed in this paper are personal.

inherently impossible—it underlines the need for carefully designed operated stabilisation schemes, particularly under the circumstances now prevailing in the world economy.

Ideally, the World Bank and Regional Development concerned with the debt problems of their members and with the allocation of resources within and across countries, should be undertaking the task of commodity stabilisation and thus improve international framework for the solution of the debt problem. It is eminently suitable for this because of their influence on developing countries' investment and production, and their ability to encourage diversification of production and the expansion of production alternatives, thus reducing the danger of accumulating burdensome surpluses of products whose prices are supported. The large financial power of these institutions is another important factor.

Commodity stabilisation was contemplated as an activity of the World Bank at the time of its establishment, but it was not undertaken. For such an activity to become a realistic proposition, a change of attitude is needed on the part of its major developed members, and of economic philosophy among some of its senior members. The prospects of change should be explored, although there are grounds for optimism at present. Under prevailing circumstances, developing countries must fend for themselves through export expansion, their mutual trade, with minimum use of scarce convertible currencies, exchange, and by improving their bargaining position in the world markets through, where feasible, coordinated selling of their products.

These measures call for:

- 1) an expansion of South-South compensable trade ('counter trade') and its better organisation in order to reduce the excessive discounts and marketing margins which now prevail;
- 2) centralised selling in the world market, at better prices, for commodities for which the demand is price-inelastic (beverages and, to some degree, metals); and
- 3) expansion of the sales volume, at competitive prices, of products which face substitution by synthetics or goods produced in developed countries, provided that such expansion is profitable.

These actions call for finance under the control of the participating countries and this is likely to prove a major bottleneck. Another problem is competition among developing countries for market shares, which stands in the way of coordinated selling.

In the long run, the prospects for broad international action to

primary production are somewhat better. Agriculture and mining in most developed countries are in a bad shape and present trends suggest that they are likely to remain so. In some cases, because of higher costs, they are in a worse position than in the developing countries. With the diffusion of economic and financial power and the enormous growth of international competition during the last thirty years, no single country or region, however powerful, is likely to be able to protect single-handed its own primary producers for long. International cooperative action will therefore be necessary. The need for such action will grow *pari passu* with the need to cooperate in money and finance, which are in as much trouble as commodities and international trade generally.

What follows is an analysis of the nature of the commodity price problem and a discussion of possible mechanisms whereby an improvement, so essential for the well-being of the developing countries, might be secured.

The collapse of prices 1980-85

The magnitude of the fall in commodity export prices is illustrated in the dollar price indices (Table 1) constructed by the United Nations Conference on Trade and Development (UNCTAD) (thirty-nine products, excluding petroleum) and the World Bank (thirty-three products, excluding petroleum), both in current (nominal) terms, for the last five years. Prices fell some 40 per cent during the 1980-2 recession. Part of this decline, about one-third, was recouped during 1983, mainly in response to economic recovery in the US, but, to the surprise of many observers, prices started to weaken again late in the same year. They have been falling relentlessly ever since, and are now below the bottom level of the 1980-2 recession. The improvement in

Table 1: Export commodity prices of developing countries, 1980-5

	UNCTAD Index 1979-81 = 100		World Bank Index 1977-9 = 100	
Peak	October 1980	119	October 1980	152.3
Trough	October 1982	75	October 1982	86.6
Peak (recovery)	March 1984	90	October 1983	102.7
Trough	September 1985	72	July 1985	81.6
Last month available	October 1985	74	November 1985	84.2

Sources: UNCTAD and World Bank data

the last couple of months of 1985 resulted mainly from a short coffee crop in Brazil. Meanwhile, petroleum has joined the parade of falling prices: its peak was reached in October–December 1981 and by November 1985 the price had fallen by 23 per cent. Since December 1985, the oil price has been in free-fall.

Annex Table A shows the commodity dollar price series in real terms for the last thirty-eight years. The present prices of non-oil commodities are lower, in real terms, than at any time since World War II, including each of its recessions.

Grilli and Yang, in their recent study of commodity price movements during the last eighty-three years, found that:

The deepest trough in nominal commodity prices occurred in 1932 and it is common to all commodity sub-groups. Prices fell by more than 50 per cent in nominal terms over the span of three years. To find another period of cyclical decline of the same duration and comparable magnitude . . . one has to look at the 1980–82 period, during which prices declined by 30 per cent. Sharp downward price adjustments also occurred in 1921, 1952–53 and again in 1975, but they were either less prolonged or less pronounced. The 'Great Depression' of the late 1920s and the 'prolonged recession' in the world economy of the early 1980s have had the strongest and longest lasting negative impact on nominal commodity prices.¹

At the time of writing (end-December 1985), the present downward price movement is not yet completed, and we have to wait for a full comparison.

Causes

No comprehensive investigation has yet been undertaken of the relative weight of the different causes of the current price decline. Those quoted include: the weakness of the present industrial recovery and the associated low rate of investment; its skewness in favour of services and high technology industries which do not consume much raw materials; technological change resulting in savings of materials; and the adverse effect on demand of improvements in inventory control and high rates of interest.

For copper, a recent comprehensive study by Takeuchi expresses the combined effect of these factors in one statistic: the decline in copper use per unit of gross product in industrial countries ('copper intensity')

¹ Enzo R Grilli and Maw Cheng Yang, *Long-Term Movement of Non-fuel Primary Commodity Prices: 1900–83*, Washington DC, 1985 (mimeo).

DEPRESSION OF EXPORT COMMODITY PRICES

Table 2: Change in 'copper intensity' by region
(KG per million constant 1980 US dollars)

	1960	1965	1970	1975	1980	1981
Industrial countries	1,107	1,125	2,017	775	827	835
Developing countries	540	547	533	574	640	720
Centrally planned economies	1,116	1,148	1,105	1,117	1,035	1,010

Source: Kenji Takeuchi, 'Changing structure of the world copper industry and its future prospects' (draft) December 1985, p 54 (mimeo).

by some 25 per cent between 1960 and 1981 (see Table 2). This tendency is partly offset by a rising trend in 'copper intensity' in developing countries (33 per cent), and the net long-run effect on aggregate world copper consumption is not clear, in view of the growing weight of the developing countries in this consumption.

There is another general factor pressing on the commodity markets, however—transfer losses, in the form of falling export prices, caused by an inelastic need for foreign exchange resulting from debt service commitments and critical import requirements. Export sales are maintained in the face of heavy competition, insufficient foreign demand and frequent trade obstacles in order to acquire desperately needed foreign exchange. A large number of primary producing countries are devaluing one after another in order to be able to compete at the present low world prices, but, as demand is frequently depressed and does not respond to price cuts, the main result of devaluations in these cases is to reduce real wages all around and further to depress world prices.

Prospects

It is difficult to see factors on the horizon which could lead to an improvement in commodity prices in the near future. The economic outlook in the industrial countries is now viewed as being less favourable than a year or two ago. The economic outlook of the developing countries meanwhile has not improved: the major debtor countries are experiencing a deterioration of their financial position as compared with 1984. Hence, the demand for commodity imports in the two areas is likely to slow down. On the other hand, there is large excess capacity in such key products as oil, copper, aluminium, sugar and grains.

The decline in commodity prices has frequently been explained by the

appreciation of the dollar. On this view, the decline of the dollar after March 1985 should have been accompanied by a recovery of commodity prices. This did not happen, however: the downward drift continued. It follows that the deflationary forces now at work in the world economy are of sufficient strength to swamp the effects of exchange rate fluctuations.

Four special factors will operate in the commodity markets in the medium term. Three of these will have a depressant, and the fourth a stimulating, effect on prices. Firstly, it is now virtually certain that the decision on 9 December 1985 of the majority of the members of the Organisation of Petroleum Exporting Countries (OPEC) to defend OPEC's market share in competition with non-OPEC oil producers will result in lower prices for petroleum. In part, the price has already fallen. Declining petroleum prices mean lower prices of petroleum-based synthetic materials, which will in turn keep the prices of competing natural materials, such as rubber, cotton, wool, jute and sisal depressed.

Secondly, the suspension of purchases by the International Tin Buffer Stock since 24 October 1985 has already resulted in a fall in the price of tin, and will also, to some degree, exercise a downward influence on the prices of other commodities. Apprehensive of possible losses on their inventories, brokers and speculators will be somewhat more reluctant than formerly to undertake commodity purchases, and bankers may require guarantees from producer country governments, in addition to commodity warrants, when lending to other buffer stocks.² The need to cover losses likely to be sustained in tin trading may have already led to distress sales of other metals held by the same speculators.

Thirdly, the farm legislation enacted by the US Congress in late December 1985 envisages a powerful drive to expand exports of agricultural products through a reduction of domestic price support and compensation of farmers for the resulting loss of income, and other measures. According to Mr Barr, Vice-President of the National Association of Farmer Cooperatives and former Director of the economic staff of the US Department of Agriculture,

The rationale is that we have been playing into the hands of our competitors. This really serves notice to the rest of the world that we are going to be very aggressive exporters. Now we are saying to them 'We are going to find out if

² 'Crisis causes problems for rubber accord', *Financial Times* (London) 6 November 1985.

'ou can compete with us either in agriculture or in treasuries.' This gives a chance for a test. If it turns out after a couple of years that competition is not the key, we'll have to go back into the programme and operate on it again.³

Fourthly, the drought of November–December 1985 in some of the major coffee-producing areas of Brazil has created expectations of a coffee shortage and a sharp upsurge in prices. A strong coffee market in the next couple of years or so will improve the position of a number of Latin American and African countries. An improvement in the price of tea, a part competitor, may also follow.

On the whole, the price-depressing factors are likely to dominate, although surprises in commodity markets are always possible.

Paralysis of international policy

No international action is at present under way to stop, or slow down, the fall in prices, or to provide finance in sufficient amounts to compensate for income losses. The commodity issue was one of the topics on which a study was prepared for the April 1985 meeting of the Development Committee of the World Bank and the International Monetary Fund (IMF), but no action was proposed, taken or discussed. The IMF Compensatory Financing Facility, after being broadened in 1981, has been made more conditional since 1983, and the access limits on it have been reduced. Action was postponed on an UNCTAD export group proposal for the establishment of a complementary financing facility, and the matter will be considered again only in the autumn of this year. The UNCTAD Secretariat proposal at UNCTAD VI in June 1983 for a programme of immediate action based on interim commodity arrangements between producing and consuming countries failed to evoke a response. The Common Fund, originally conceived as the main vehicle to assure support and stability for commodity prices, is still in the process of ratification. The latter now depends on the action either of the socialist countries of Eastern Europe or the US.

As negotiated, the Common Fund will need the support of new commodity arrangements in order to be able to exercise its stabilising functions, but no new agreements have been concluded (after that on natural rubber) in the implementation of the Integrated Programme for Commodities. The agreements on sugar and cocoa are not operative

³ *The New York Times*, 23 December 1985. See also *Financial Times* (London) 24 October 1985 ('US, gears up for export drive but farmers still face bankruptcy'), and *The Wall Street Journal*, 23 December 1985 ('Farm fallout').

and the fate of the agreement on tin is uncertain. This leaves as the effective agreements those on coffee and natural rubber. A recently reported initiative to reach an understanding on petroleum has failed. Apparently, an OPEC price cut was suggested in return for a cooperative effort that would help to revive purchases of oil by the member countries.⁴ Several developed countries, including Japan, Sweden and the Netherlands, were in favour of a dialogue with OPEC in recognition of a common interest in price stability, but the majority of developed countries were reported to be opposed to discussion at the present.⁵

The debt crisis

The 1982–5 debt crisis has exacerbated the commodity problem, which in turn, has aggravated the debt crisis. The dominant theory of adjustment, based on a 'case by case' approach, has relentlessly advocated export-led growth in virtually all debtor countries. While this policy has paid off so far for exports of manufactures, it has had a negative effect on the exports of primary products. It has helped to drive down their prices and, in conditions of low short-run price elasticity of demand, to depress the export revenue of the debtor countries as a group.⁶

The aggravation of the debt crisis during 1985 has led to new calls for international action by the debtor countries and to a new initiative by the US Government aimed at stimulating the resumption of private bank lending to major borrowing countries, which had completely dried up. The initiative was also aimed at increasing the lending of the multinational development banks, the World Bank and the Inter-American Development Bank. This initiative continues to be based on a 'case by case' approach, however, and does not contemplate any specific action to change the international framework of the commodity problem—commodity prices, obstacles to trade and the international rate of interest.

The idea that the World Bank should play a major role in stabilising commodity prices has existed since its establishment, and this consideration

⁴ *The Wall Street Journal* (New York) 21 July 1985.

⁵ *The New York Times*, 10 July 1985; *Le Monde* (Paris), 11 July 1985.

⁶ See further on this, Dragoslav Avramovic, *Developing Country Debts in the Mid-1980s: Trends and Policy*, December 1985 (mimeo).

inevitably comes to mind now as new approaches to the debt problem, in which the Bank is vitally interested, are being discussed. In the inter-Allied discussions prior to the Bretton Woods Conference of 1944, Keynes, on the basis of his theoretical work and his practical experience of the 1920s and 1930s, advocated setting up three international institutions—one to handle exchange and liquidity problems (eventually the IMF), the other to handle long-term investment for post-war reconstruction and development (eventually the World Bank) and the third to finance commodity stabilisation through buffer stocks. His commodity plan survived the criticism of British Government departments, the main one coming from the Ministry of Agriculture, whose officials did not believe that supply restrictions could be avoided and had doubts whether a buffer stock could take care of fluctuations and surpluses.

It was at the Washington Conference of September 1943 between the US, the UK, and Canada, held prior to the final preparations for the Bretton Woods Conference, that the third part of the trinity—the Buffer Stock Organisation—fell through. The US Department of Agriculture considered the Buffer Stock Plan unacceptable because it was too market-oriented: at that time, the department was still feeling the impact of the Great Depression. In contrast, the chief US negotiator at the Washington conference, William Clayton, was a great believer in free trade—and he considered the Buffer Stock Plan too restrictionist. Another major complication apparently arose when President Roosevelt initiated the Food Plan—the predecessor of the Food and Agriculture Organisation (FAO). He was already thinking about feeding the hungry of the world, while Keynes was trying to save the world from surpluses. As Sir Roy Harrod, a close collaborator and subsequently a biographer of Keynes put it:

The Americans long in negotiations have fobbed the British off—the British were advocating a specific scheme for Buffer Stocks to be instituted when the war was over—by saying ‘Don’t press us on that now; the Bank can look after such things.’ . . . I don’t know if we (the British) ever did decide to drop the Buffer Stock Plan; but it was not on the agenda at Bretton Woods.⁷

In late 1968, at my request, the former Secretary of the World Bank, Morton Mendels, searched for and found in the IMF files the 1943

⁷ Private correspondence with Sir Roy Harrod, letter of 28 January 1969. The story of British-American negotiations was told to me by Sir Roy orally in London on 4 December 1968, and later confirmed in correspondence.

correspondence confirming that the Buffer Stock Plan was active discussed at that time. In some of the drafts it was envisaged that the commodity stabilisation functions would be part of Bank operations. As it has turned out, the World Bank has not become involved in commodity stabilisation, despite suggestions that it should. Yet, in view of its actual and potential influence on investment and production including diversification into alternative lines of activity, it could play a major role in support of the Common Fund when it is ratified, or directly before ratification. Given this influence, it might be better able than other institutions to prevent the accumulation of burdensome surpluses and at the same time enable the producing countries to expand production where this promises to be worthwhile. For such action by the Bank to become a realistic prospect, however, attitudes among some of the major developed countries who are its members and the economic philosophy of some of its senior staff, will need change. Regional Development Banks could also play a role.

Analytical questions

It is difficult to be optimistic about the prospects for a broad North-South arrangement on commodity prices in the light of past history, conflicting short-run interests and the economic philosophy prevailing in some quarters. A complicating feature has been the animosity of a considerable part of the economics profession towards commodity stabilisation. This factor may have had more influence on national administrations and international agencies than is commonly thought. And yet much of this animosity is not well founded, as Professor Behrman points out in a recent study:

An example is provided by Harry Johnson's severe 1976 criticism of the primary commodity price stabilisation-buffer stock agreement and of UNCTA economists because 'elementary economic analysis' reveals that the UNCTA proposals would lead either to a reduction in producer revenue or an increase in revenue variability. Even if one grants Johnson his use of simple static supply and demand models with no externalities, no market power, etc., his scathing critique depends critically on further simplifying assumptions (e.g. linear supply and demand curves with instantaneous adjustments and additive stochastic shifts). Rather than demonstrating the incompetence of UNCTA economists, as Johnson claims, his analysis demonstrated the extent to which special simplifying assumptions may be misleading, no matter how arrogant

* Miss Marie Stark, from the office of the Secretary, IMF, located the 1943 documents.

the results are presented. Though I have used Harry Johnson's analysis as an example because of his prominence and influence, he was not alone in making such assumptions.⁹

In the discussions of the mid-1970s, when the Integrated Programme and the original Common Fund proposal were under active consideration, the main problem which had to be faced—and which, to some extent, still has to be faced—was the belief held by many neo-classical economists that the developing countries did not have a case. And yet no one has disputed, to my knowledge, the essence of that case as set out below:

As matters now stand, the many financially weak producing countries, mostly low-income, have a limited staying power in the international market. Financially unable to carry stocks and in urgent need of foreign exchange, the low-income countries are frequently compelled to sell competitively on a falling market the commodity surpluses which periodically inevitably arise because most commodity production is highly variable and cannot be adjusted quickly to changing demand. These distress sales, usually accompanied by sales from speculative stocks, force even the financially stronger developing countries into competitive selling, as they become concerned about a loss in market share. This pressure of sales occurs in the face of a limited number of financially strong buyers in developed countries who postpone purchase in the expectation of still lower prices, apprehensive of losses on inventory if they buy prematurely.

It is these circumstances which frequently lead to extremely sharp price falls and to associated declines in producers' incomes, sometimes disastrous. Even under normal circumstances, when crops are near average, the bunching of competitive sales in the face of a limited number of buyers will lead to erosion of the market price, or to special sales under the market, or both.

The losses incurred by low-income sellers in falling markets normally cannot be compensated by gains on rising markets. To achieve such gains, the sellers would need financial power to hold supplies off the market for a considerable time while it is rising. The developing countries do not have such financial power, although there are rare and temporary exceptions.¹⁰

Cooperation among developing countries

Developing countries have expanded their share of world imports of several major agricultural raw materials and foodstuffs significantly. In rice, palm oil and jute the developing countries now account for more than 50 per cent of world imports. In soybean oil, sugar, cotton and sisal, the share is between 40 per cent and 50 per cent (Table 3). As developing countries are large, and in some cases dominant, producers of these commodities, substantial scope has been created for expanding the trade between them. However, the actual expansion of trade appears to have lagged behind its potential, as primary producers among the developed countries have disproportionately increased their sales, partly because of the lag in developing country production and partly because of the better financing terms which developed countries were able to offer.¹¹

Table 3: Developing countries' percentage share of world imports

	1964-6	1969-71	1979-81	1982
Agricultural Raw Materials				
Jute	26.6	30.6	54.9	57.4
Cotton	35.1	29.5	49.6	47.0
Sisal	n/a	n/a	n/a	40.0
Rubber	18.9	20.3	25.7	25.6
Cereals				
Rice	74.0	82.8	78.7	80.7
Wheat	57.3	55.3	59.4	59.2
Coarse grains	11.2	14.1	29.4	41.3
Other Foods				
Palm Oil	24.6	30.0	59.4	62.5
Soybean Oil	31.0	31.5	43.1	44.9
Sugar	29.0	27.1	41.5	42.5
Beef and Veal	9.2	11.2	22.6	27.7
Coconut Oil	13.8	11.2	15.9	13.4

Source: World Bank, *Price Projections for Major Primary Commodities*, September 1984; Mehmet Arda, *South-South Trade in Commodities*, UNCTAD, 1985.

¹¹ For empirical evidence of the lag, see Mitojka Nemanic and Marjeta Zver, *Primary Commodities Statistics—Trade Among Developing Countries 1974-84*; and Mehmet Arda, UNCTAD, *South-South Trade in Commodities*, both circulated at the Conference on Primary Commodities—A Challenge to Cooperation among Developing Countries, held in Skopje, Yugoslavia, on 26-7 September 1985. Better financing terms offered by developed countries have been encountered worldwide.

The financial crisis of the 1980s has given rise to a large expansion of the compensable trade ('counter-trade') of the developing countries, both among themselves and with developed countries. By assuring a rough equivalence in deliveries, compensable trade has enabled the interchange to take place despite acute shortages of convertible foreign exchange. It is the compensable trade among developing countries which has grown particularly rapidly in recent years. Annex Table B contains a list of transactions recorded in 1982-3. The list is not exhaustive, as necessary details are not available for all transactions. Even so, it provides an impressive picture of the scope, geographical spread and variety of products in developing country compensable trade. The list is a mixture of primary products-for-primary products exchange and of primary products-for-manufactures exchange. A similar compilation has been made of possible future transactions among selected developing countries.

Four problems have arisen in compensable trade:

- a) Only a small proportion of the transactions (4 per cent in a recent sample) consist of pure barter which does not call for any finance. The rest are counter-purchase, offset deals, buy-back arrangements and switch trading which all involve differences in timing of deliveries and therefore require bridging finance. The finance is mostly short-term, however.
- b) Bilateralism of transactions has disadvantages in principle whose impact varies from case to case. What is now emerging are triangular and multilateral deals and improvements in payments arrangements which should lead to greater efficiency and broaden the scope of South-South trade over a period of time.
- c) Much compensable trade has been handled by companies located in developed countries. This has been the case even when the goods were sold in developing country markets: much of the compensable trade between the developing countries and the US and the UK is apparently of this variety.¹² Discounts and marketing margins have occasionally been quite large, resulting in a loss of income and a deterioration in the terms of trade. It follows that a major effort needs to be made to maximise direct trade

¹² Thomas B McVey, 'Countertrade, Commercial Practices, Legal Issues and Policy Dilemmas', in *Law and Policy in International Business* 16(1) 1984, p 57; Department of Trade and Industry, Project and Export Policy Division, *Countertrade: Some Guidance for Exporters*, London, May 1984, p 12.

among developing countries, and this calls for South-South finance.

- d) Production has lagged in a number of developing countries, reducing the surpluses available for export.

In most cases, there should be no conflict between the expansion of South-South trade and the expansion of developing country exports for convertible currencies which continue to be badly needed. Both the mutual trade and the trade with the rest of the world can develop simultaneously, as long as there are unused resources in developing countries and their exports to developed and other convertible currency countries are subject to market limitations.

Possibilities of price improvement

For tropical beverages and, to some degree, selected metals, coordinated selling could result in an improvement in prices and revenue, as the market can take the price changes within reasonable limits. This is not a new idea,¹³ but its realisation has not proved easy for a number of reasons. Some of the relevant considerations are:

- a) The experience of the coffee agreement, which operates export quotas and discriminates between the quota and non-quota markets ('new' markets), is that price discounts develop in sales to the non-quota markets and tend to spread. The discounts have recently averaged 40 per cent and have applied to about one-fifth of total coffee exports. A similar discounting practice has been encountered by OPEC and led to the erosion of the target price. To deal with this problem there does not seem to be any alternative to channelling all sales through a centralised selling agency. This system seems to have been discussed at the July 1985 OPEC meeting, but apparently no conclusion was reached.

Professor Robert Mabro has proposed that OPEC should withdraw altogether from short-term sales and sell all its oil in fixed one-year contracts at unalterable prices, and that a central clearing house should be set up which would allocate the demand for these contracts to each OPEC producer in proportion to its allowable OPEC quota.¹⁴ Experience with a successful central

¹³ For history, see Alfred Maizels, *Selected Issues in the Negotiation of International Commodity Agreements: An Economic Analysis*, UNCTAD, 1982, p 51.

¹⁴ *Financial Times* (London) 11 July 1985, reporting on the Oil Industry Developments Conference of 10 July 1985.

selling organisation exists: de Beers has operated it for decades in the diamond market through successive business cycles and structural changes. This experience is worth studying.

- b) A central selling organisation may solve the problem of implementing a producers' agreement, but does not solve the problem of quota allocation. The vexing issue here is the conflict between old and new producers which has been a major obstacle in the way of a tea agreement. To cope with this problem, Mr Leelananda de Silva has proposed a scheme for entitlements to export earnings 'which would allocate earnings to each producing country not necessarily on the actual volumes it exports but on its export potential, taking due regard of the principle that in an international commodity agreement both exports and the withholding of exports in the interest of supply management are contributions to the expansion of total export earnings.'¹⁵

The effect of the scheme would be to put a premium on product diversification. The idea has some resemblance to the acreage withholdings applied in some developed countries. A variant of it turned up in a copper scheme prepared by the Economics Department of the well-known minerals firm, Rio Tinto Zinc.¹⁶ The de Silva proposal and its possible variants for different commodities should be studied.

- c) A complementary means by which an understanding could be reached between the different producing countries in allocating export quotas would be to operate through the contemplated Global Scheme of Trade Preferences (GSTP). The industrially more advanced countries, eg in Latin America or India, could be expected to yield part of their share of export markets in coffee and tea to the less advanced countries in Africa, as they would be likely to be the primary beneficiaries of any preferential access—through the GSTP—to markets for manufacturers. The same argument applies to those developing countries which could be expected to support the price improvement schemes even though they do not export any primary product benefiting from such an arrangement: they should, at any rate, be able to benefit from the GSTP.

¹⁵ Leelananda de Silva, *International Commodity Trade: A Scheme For Export Earnings Entitlements*, Geneva, 1983 (mimeo).

¹⁶ *Compensatory Loans for Copper Production Cut-Backs Accompanied By Stockpiling Arrangements*, London, May 1983.

- d) Finance must be available at least for the initial stocking period, however brief, as measures to control production and exports, and thus improve prices, take time. In the absence of finance, the producing countries have no choice but to sell on the market, however weak it may be.¹⁷ This point brings us to the proposal to establish a financial institution for the developing countries. It may be argued that the time is not propitious, and yet the developing countries still have enough resources to establish such an organisation, and they have little choice if they want to influence commodity markets.
- e) Target prices must not be set too ambitiously. This was an important factor in the suspension of purchases by the International Tin Buffer Stock, although there were others—for example, the insufficient size of the stock, the excessively rapid expansion of output in non-member developing countries, stock disposal by non-members and the impact of exchange rate fluctuations.

The institutional framework

Proposals exist for handling the issue of finance institutionally, both to facilitate the intra-country trade of developing countries and to strengthen their staying power in world markets and thus to help to improve their selling prices where feasible. With respect to this latter objective, the original UNCTAD Secretariat proposal for the establishment of a Bank of Developing Countries (South Bank) placed major emphasis on the provision of commodity finance as one of its central functions in order to improve the capacity of these countries for supply management.¹⁸ Inter-governmental negotiations on this proposal have moved slowly, however. The main opposition has come from several oil-exporting countries in the Gulf, essentially on the grounds that the existing institutions can fill all the gaps in finance,

¹⁷ Dr Ali Ahmed Attiga has made this point succinctly as it applied to petroleum exporting countries in: '*Options de développement des pays Arabes exportateurs de pétrole*', lecture given at the World Bank Staff Seminar, 18 December 1981, published by O.APEC, Kuwait, 1983, p 13.

¹⁸ See, Dragoslav Avramovic (ed), *South-South Financial Cooperation: Approaches to the Current Crisis—Jamaica Papers*, Francis Pinter, London, 1983; and *Report on the South Bank*, Office of the Chairman of the Group of 77, New York and International Center for Public Enterprises in Developing Countries, Ljubljana, Yugoslavia, 1983.

including commodity stabilisation finance, and, if the existing institutions are not willing, they can be reformed.¹⁹

This argument is not difficult to disprove, as stated by the Secretariat of the Brandt Commission:

... the chief reason for the lack of facilities or instruments for important types of financing is the lack of trust and the troubled relationship between developed and developing countries. The common feature of the different gaps is that they go to the heart of the economic and political relationships between the developed and developing countries. Whether it is programme lending, or commodity stabilisation, or promotion of LDC (less developed country) exports, or finance to enable them to cooperate with each other more effectively, or the development of mineral resources to their advantage, or the reorganisation of unviable debt structures, all these in their several ways, singly and together, are forms of finance which would enable the poor countries to become self-reliant and independent participants in a more equitable exchange with the rich countries. Thus they all call for a new approach to decision-making. It is this approach which has so far been lacking in North-South relations and which has so far defeated various efforts towards the reform of existing institutions in covering these gaps.²⁰

Recently, it was suggested in an OAPEC (Organisation of Arab Petroleum Exporting Countries) Bulletin editorial that long-term solutions to the problem of supply/demand fluctuations in oil 'might include broadening the scope of the OPEC Fund for International Development to cover helping those member countries that suffer most during periods of supply/demand imbalance in the oil market. It might also be worth considering the formation of a joint marketing committee within OPEC to coordinate and monitor the implementation of the member countries' marketing policies.'²¹ The same prescriptions apply to other developing country exports for which demand is price-inelastic. One of the ways of creating the South Bank would be to transform the OPEC Fund into an all-developing country financial institution. This was the proposal made by Algeria and Venezuela in 1979.

With respect to the 'intra-trade' of developing countries, a proposal for financing its expansion was made in July 1983 by the President of the Bank of Credit and Commerce International.²² The proposal envisaged the establishment of a Third World Bank—a consortium of banks of

²² Address by Mr Agha Hasan Abedi, at the Third Conference of Banks from Developing Countries, Ljubljana, Yugoslavia, 6 July 1983.

developing countries, public and private—to promote their mutual trade; to institute a mutual settlement system for this purpose, which would economise in the use of convertible foreign exchange; to provide short-term balance-of-payments and bridging finance; and to extend short-term commodity finance. In further work on this proposal, major emphasis has been placed on financing compensable trade, provision of credit covering exports for convertible currencies, and the development of a mutual settlement facility with its own unit of account. With further evolution the latter may, if successful, play a considerable role in facilitating the growth of intra-developing country trade.

The two financing approaches—the South Bank and the Third World Bank—are complementary. The South Bank would cover the financing of joint ventures and other projects, particularly in minerals, and support the payments arrangements of developing countries and their mutual trade, besides involving itself in commodity stabilisation. It would operate in the medium and long term. The Third World Bank would concentrate on short-term trade and trade-related finance. These two financing mechanisms and the proposed Global System of Trade Preferences would represent a major institutional innovation. If realised, they could lead to a broad cooperation by the developing countries in the trade and monetary and financial spheres, both in their mutual relations and in their relations with the outside world.

The long run

Professor Lord Kaldor, a long-time believer in commodity stabilisation, suggested recently that special drawing rights (SDRs) should be issued for the acquisition of commodity stocks, and stressed the importance of commodity stabilisation both for international monetary stability and to assure the supply of primary products for long-run growth. He concludes by recalling Keynes' scheme and has some poignant words on its fate and on the tortuous road of the Common Fund:

If . . . economic growth in the long run depends on the growth of availabilities of the essential 'inputs' of the industrial sector, in food, industrial raw materials and energy, the prime condition is to secure stable world prices for such commodities through a new international reserve currency that is *de facto* convertible into commodities. This, I am sure, was the thought behind Keynes' advocacy of an International Commodity Control. His proposals have thus the same intended effect as the more recent proposals for a 'Common Fund'—even though the latter is not linked to the creation of a new international currency convertible into commodities. However, since the latter scheme originated

with the 'developing' countries (members of UNCTAD), it had the same cool reception which Keynes' ideas received from the British Establishment during the War. Nobody seems to have understood that, while the proposal was prompted by the developing countries, its adoption was in the vital interest of the 'developed' or industrialised countries, since it is a pre-condition for securing adequate long-term investment necessary for sustained industrial growth.²³

A similar idea was put forward in the Secretariat of the Brandt Commission, and directly tied to the proposal for a commodity reserve currency.²⁴ A number of issues need to be dealt with in this area, including the difficult question of storage costs. There is little doubt, however, that the problems of monetary stability, growth and commodity stabilisation are closely related.

Given the enormous difficulties which confront primary producers in all countries—developed as well as developing—it is only a matter of time, in my view, before the international commodity issue will be back on the international agenda.

The present world situation in primary production has been described as follows by an expert observer:

There are huge acreages of farming land worldwide which are becoming redundant because production is exceeding economic demand. This land, and its farmers, are just as redundant as mines and steelworks and their personnel. The repercussions of this situation on the farm supply industries, and even on the political stability of the countries concerned with exporting are most serious.

To bring the argument nearer home. The EEC Commission is seeking to cut production by various means, as already seen with milk quotas. I very much doubt if slow strangulation by price restraint will cut off production for a long time. The need to take land out of farming is just as necessary in economic terms in Europe as it is in the US and elsewhere. The political question of the day is whose land is to be sterilised and how will farmers be compensated.

Suggestion of allowing prices to fall until the market recovers is not a real starter. It happened just like that in the 1930s, causing widespread destitution in rural areas and dustbowls and the like. Of course, it did work: prices eventually rose and farming got back on its feet, but it took ten years and we will never know if the war had more to do with the recovery than the *'laissez-faire'* approach.²⁵

²⁵ John Cherrington, 'Rooting out the redundant acres', *Financial Times* (London) 15 October 1985.

According to a leading French exporter of cereals, 'their prices have experienced a free-fall.'²⁶ Confirming this, Argentina's export prices of grains are reported to have fallen by 20 per cent in 1985 alone.²⁷ It is the cumulative effect of these developments, now operating throughout the world, which will lead to a change in economic thinking and international policy, before, it is to be hoped, enormous damage has been done.

Rural development in an arid region: Xinjiang

Xinjiang Uygur Autonomous Region is the largest administrative unit in China. It covers a vast area of 1.6 million square kilometres, or 16.7 per cent of China's territory. The population, however, is small—less than 14 million people or 1.3 per cent of China's population. The region is remote and inhospitable and this accounts for the low population density.

Physically, Xinjiang is divided into three sub-regions. In the south is the Tarim basin, in the heart of which is the Taklamakan desert. The basin itself is surrounded by high mountains and the climate in the basin is very dry. The fringe of the basin, however, is speckled with oases which use the melted snow from the mountains to irrigate a large variety of crops. Kashgar, the largest oasis, is located in the extreme west of the basin and has an annual rainfall of 50–60 mm on average in a range of 10 to 100 mm.

The Junggar basin occupies the northern part of Xinjiang. It, too, has a desert at its centre, but the Junggar is less arid than the Tarim although it is considerably colder. Most of the basin consists of grassland and the main rural activity is livestock raising, mostly sheep, by nomadic and semi-nomadic pastoralists. The basin is bounded in the north by the Altai Mountains, on the west by a lower range of mountains and on the south by the Tien Shan.

The Tien Shan run from west to east across the whole of Xinjiang and divide the two basins from one another. The range contains peaks as high as 7,400 metres and many of the mountains are permanently covered in snow. These provide water for irrigating the Ili Valley in the west, the state farms around the regional capital, Urumqi, in the middle of the range, and the Hami and Turpan depressions in the eastern section of the range. The oases in the Turpan depression are especially noteworthy since the depression is 160 metres below sea level and is practically rainless, yet Turpan is a major centre in China for the production of grapes and melons.

Demographically, Xinjiang is typical of China as a whole in that a high proportion (68.4 per cent) of the population lives in rural areas.

Source: Xinjiang Academy of Social Sciences

About 60 per cent of the people are not Han, but members of minority nationalities, the great majority of whom live in the countryside.¹

Politically, Xinjiang is not a province but an autonomous region. This is advantageous for two reasons. First, the Regional People's Congress in Urumqi has the authority to devise local laws and regulations that reflect its peculiar characteristics and the interests of its various ethnic minorities, and, second, Xinjiang is eligible for special assistance from the central government. Some of the taxes collected in the region are retained for its own use instead of being passed on to the centre and special funds intended for construction and investment projects in border areas have been given by the centre. The central government has also given funds direct to the county authorities to use as they think best. In aggregate the central government currently provides about 1.6 billion yuan a year² in Xinjiang in the form either of direct investment in infrastructure or as grants and loans to regional authorities. This is equivalent to about half the capital formation in the region.

¹ The national minorities of Xinjiang include the Uyghurs, Kazaks, Kirgiz, Tajiks, Ozbeks, Tatars, Dongxiang, Daur, Xibe, Russians, Mongolians and Hui, the two most important in Xinjiang being the Uyghurs and Kazaks. Strictly speaking, the Hui are not an ethnic minority; they are of Han descent and speak Chinese and differ from other Han primarily in their adherence to Islam. Most of the ethnic minorities are culturally Muslims.

² The rates of exchange in the Summer of 1985, when the research for this study was conducted, were \$1 = 2.96Y and £1 = 3.93Y.

The structure of the economy

Although most of the people in Xinjiang live in the rural areas, only 43 per cent of the gross output value originates in agriculture; the rest is produced in the industrial and mining sectors. Within agriculture the broad composition of the value of output in 1984 was as follows:

crop cultivation	70.3%
animal husbandry	18.2%
forestry	3.2%
fisheries	0.2%
sideline production	8.1%

Sideline production, including village industrial enterprises, is about half as important as in the rest of China, reflecting the remoteness of the region and dispersed settlement pattern. At first glance, animal husbandry, at 18.2 per cent of gross agricultural output value, seems rather low, given that in China as a whole livestock products accounted in 1982 for 15.5 per cent of agricultural production. The comparison, however, is misleading because in most areas of China pig production accounts for a large part of the value of output in the livestock sector, whereas in Xinjiang, a Muslim region, pig production is unusually low. The most important livestock in Xinjian are sheep and goats, of which there were 24.4 million in 1983.

Grains (maize and, above all, wheat) dominate crop cultivation and account for 69 per cent of the sown area. Grain output per head is now 739 jin³ and is higher than the national average of 701 jin in 1982. Given this, and the fact that China is now self-sufficient in grain and, indeed, has a relative surplus and a grain storage problem, it would make sense for Xinjiang to consider reducing the area devoted to wheat and maize. Some land in the plains and villages, I believe, could be used for intensive, irrigated pasture and forage production, thereby making it possible to reduce somewhat the grazing intensity on natural pastures in the mountains. The mountain areas affected could in part be reforested in order to control erosion and in part allowed to rest in order to give the grass an opportunity to recover from over-grazing. In some areas the grasslands could be re-sown with improved grasses. In a few areas tourism, properly controlled, could be developed in parallel with an afforestation programme, thereby making it possible for more people to

³ 1 kg. = 2 jin.

enjoy the mountains, rivers, lakes and reservoirs which contribute so much to the beauty of Xinjiang.

The main cash crops are cotton, sugarbeet and various types of oil-bearing crops, eg, rapeseed, sunflower and sesame. Cash crops occupy just over 19 per cent of the sown area. The rest of the land (11.7 per cent) is used to grow a wide range of vegetables and fruits, of which grapes, melons, apples and pears are probably the most valuable. The cropping pattern, as is evident from the above figures, is biased toward low value, high bulk products and it clearly would be in the economic interest of Xinjiang to shift the composition of output in favour of crops with a more favourable ratio of value to weight. In effect this means switching on the margin from grains to fruit.

Such a shift in the cropping pattern, however, will require heavy investment in transport facilities, including air transport. High transport costs and the consequent economic isolation of the farming areas of the oases virtually force each sub-region within Xinjiang to be self-sufficient in basic foodgrains. Conversely, high transport costs make it very difficult to produce specialised, high value crops for large but distant markets. The result is that for every mu⁴ devoted to fruits and vegetables nearly seven mu are devoted to grains, despite the fact that agriculture is entirely dependent on expensive irrigation systems.

Be that as it may, the rate of growth in Xinjiang has been impressive. Historically a remote, isolated and economically backward region, in recent years Xinjiang has grown faster than the rest of China, most remarkably in agriculture,⁵ and has experienced rapid improvements in average living standards (see Table 2). Although, it is true, living standards still are much lower than those in the richer provinces and

⁴ 15 mu = 1 hectare.

⁵ Over the long period 1950-84, agricultural output value in Xinjiang grew 5.63 per cent a year in constant prices.

municipalities of eastern China, the heartening thing is that agricultural incomes have risen relatively quickly and the difference between rural incomes in Xinjiang and elsewhere in China is rapidly disappearing.

The agricultural system in the oases

The rural population of Xinjiang is 9.2 million, including 1.8 million in rural townships. The rural labour force is 3.8 million, including those who work on state farms. There are about 774,000 people in the livestock sector or 264,000 workers. The rural economy of the region consists of three sub-sectors: the agricultural system of the oases, the state farms on land reclaimed from the desert and the pastoral economy of the semi-nomadic people.

In general the institutional arrangements within the oases are similar to those in the rest of China. Virtually all the production teams have switched to the household responsibility system and to production contracts. The communes have been converted to townships (*xiang*) and the brigades have largely disappeared. The teams continue to exist—although they are often called ‘villages’—and in addition to administering the contract quotas, they maintain the collective accumulation and welfare funds.

The largest oasis in China is the Kashgar prefecture and, despite its size, it is fairly typical of most oases in Xinjiang. The prefecture covers 11 counties and the city of Kashgar (or Kashi). The population is 2.31 million, of which 1.84 million live in rural areas and 470,000 in urban areas. Rural income per head in 1984 was 213.57 yuan.

Agriculture is dependent on irrigation water obtained from melted snow that is transported by rivers and canals from the Pamir Mountains. The total cultivated area is 6.6 million mu, 95 per cent of which is irrigated. The cropping ratio is low, viz. 1.09, indicating that only 9 per cent of the land is double cropped, the rest yielding a single harvest in the summer. The sown area is thus 7.2 million mu. Nearly 70 per cent of this area is devoted to grains (wheat and maize) and 19 per cent to cash crops (mostly cotton). Relatively little land is used to grow fruit, melons and vegetables. The reason is that it does not pay to do so: fruit is in surplus, there are few food processing factories and lack of transport makes it difficult to ship fresh produce to markets outside the prefecture.⁶

⁶ In the whole of Xinjiang there are only 800 km. of railway and 23,000 km. of roads. Transportation clearly merits the high priority it has been given in the most recent economic plan.

The prefecture contains 36 million mu of pasture which supports four million head of livestock, mostly sheep. It thus requires 9 mu to support one animal. Given that most of the pasture is unirrigated this is not a high ratio for an arid region, but the intention should be to increase the amount of irrigated pasture, thereby permitting an increase in herd size and an improvement in breed quality. Additional water for irrigating pastures could be made available, as we shall see, by a more economical use of existing supplies.

Livestock in Kashgar are closely integrated into farming. Four-fifths of the animals are owned by farmers who support their small flocks from the grasslands allocated to them, from controlled foraging in the forest areas and from wheat straw. A little more than 10 per cent of the animals are raised under semi-nomadic conditions, summer grazing in the mountains alternating with winter grazing in the plains. This general pattern is characteristic of livestock in the Tarim basin, and differs considerably from the nomadic patterns more common in the northern parts of Xinjiang.

The oases of the south are large, isolated, self-sufficient economies that revolve around grain and livestock. Kashgar produces all the grain it needs, imports about 12 per cent of its meat (mostly pork for the non-Muslim population) and exports cotton. Very few other agricultural products are either imported or exported to other centres.

Two elements operate as constraints on accelerated development. The first, as we have already emphasised, is transport and marketing. The second is the availability of water for irrigation. This, in turn, can be divided into two components: the size or capacity of the irrigation system and the efficiency with which a given supply of water is used.

The irrigation system of Kashgar consists of 102 reservoirs of all sizes plus 30,000 km. of canals of four different sizes. The main purpose of the reservoirs is to reduce the seasonal imbalance in the demand and supply of water. The peak demand for irrigation water is during the spring when 40 per cent of the annual requirement occurs. Yet only 12 per cent of the yearly supply of water is available in the months of March to May; 64 per cent is available in the Summer (June–August), 18 per cent in the Autumn (September–November) and 6 per cent in the Winter (December–February).

It is estimated by the prefecture authorities that there is a shortfall of 1.7 billion cubic metres of water. During the next few years, however, it is planned to build four new reservoirs. In addition, there are plans to

construct eight large drainage canals which should help to combat the problem of soil salinity.

Meanwhile, steps can be taken to use the existing water more efficiently. In general, the management of the irrigation system appears to be very good. There is no problem, common in other countries, of farmers located conveniently at the head of the system getting more than their share of water or of the richer farmers obtaining extra supplies of water through bribery.

Water is distributed throughout the system in proportion to land area, starting at the level of the prefecture and going down through the county and *xiang* until one reaches the village (or production team). At the village, particularly in the Spring when water is scarce, two persons are selected by the votes of all members of the village to oversee the distribution of water and the management of the irrigation system. Water, thus, remains under unified collective management. Irrigation water typically is allocated among households in terms of time (eg one hour of irrigation) and in proportion to the area farmed.

Management problems become more complex, however, when private wells are combined with communally owned irrigation facilities. In Turpan, for instance, about 100 wells have been dug by households and this has created a conflict of interest between the private and public sectors. Until now China has not needed a water law to regulate the private exploitation of ground water, although ground water is a public resource analogous to a common resource. However, problems have emerged in Turpan which have brought this issue to the attention of the authorities. Quite often, apparently, privately owned wells either have been placed too close to publicly owned ones and have lowered the water table or they have been drilled too close to the *qanats*⁷ and have had the same consequence. Regulations to prevent this do not at present exist and it is important to remedy this deficiency quickly before serious damage is done to the entire irrigation system.

Technically, the most obvious way to improve efficiency in the use of existing irrigation water is to reduce the amount of water lost by seepage from the canals. At present only 30–37 per cent of the water in the canals

⁷ *Qanats* (also called *kanats*, *karjin* or *karez*) are underground tunnels which carry irrigation water from the Tien Shan to the Turpan depression. There are 3,500 km. of *qanats* in Turpan, with an average length of tunnel of 3 km. They are the single most important source of water in the region and date back hundreds (perhaps a thousand) years. *Qanats* are also found at Hami and Yanqi in Xinjiang, but half of China's *qanats* are in Turpan. Iran, of course, is famous for its *qanats* and it is possible that this system of irrigation was imported into China from Iran.

system ultimately is used for irrigation; the rest disappears through evaporation and seepage. The main problem is that most of the canals are unlined earth ditches, and in these canals up to 90 per cent of the water is lost through seepage. In stone- or pebble-lined canals the seepage rate falls to 60 per cent and in the new plastic-lined canals the seepage rate is only 20 per cent. The immediate objective of the authorities is to raise the water use rate to 45 per cent, primarily by lining the general and main irrigation canals with thin sheets of plastic. This supplements, but does not supersede, traditional techniques for controlling seepage, namely, planting grass, willow trees and poplars along the banks of the canals.

An economic instrument also exists that can be used to encourage an efficient use of water, viz., water charges. At present, unfortunately, this instrument is of little significance. Indeed, water charges in Xinjiang are the lowest in China and Kashgar's charges are the lowest in Xinjiang. We thus have a paradoxical situation in which the greater the scarcity of water, the lower the charge for using it! There is almost no financial incentive in Kashgar for farmers to economise on their most precious resource. The water fee today is equivalent to about 1.5 per cent of the value of the gross agricultural output produced in the irrigated areas. This fee generated a total revenue of 6.1 million yuan in 1984, a sum that covered only 81 per cent of the running costs of the prefecture's irrigation service;⁸ no contribution was made toward the amortisation of capital. A similar situation exists elsewhere in Xinjiang.

Peasants were accustomed to paying much higher charges in the past. Before Liberation in 1949, Turpan was dominated by water-lords, and the cost of irrigation was at least four to twenty times higher than it is today. It is not suggested that water fees should be raised to pre-Liberation levels, but it is evident that present charges are too low to discourage farmers from wasting water.

Control of the desert

One quarter of Xinjiang is true desert and much of the rest is arid. A precondition for rural development therefore is control of the desert.

⁸ The prefecture's current expenditure in 1984 was as follows:

Wages and salaries	4.7 million yuan
fuel and materials	0.8
repairs and	
maintenance	2.0
Total	7.5

Alas, for many years the desert appeared to be out of control in Xinjiang. True, the amount of arable land increased from 15 million mu in 1949 to 48 million in 1985, but a third of the land suffered from salination and the problem seemed to be getting worse. In addition, 8 million mu became hard baked or heavily eroded. Finally, the forest cover contracted steadily and today accounts for only 1.1 per cent of the land area or 26.8 million mu. Xinjiang's problems, in other words, were not very different from those of other arid and semi-arid regions in other parts of the world.

The basic cause of desertification was of course the neglect of forestry. In the early years after Liberation few trees were planted, perhaps only 10,000 mu per annum, and by 1982 the problem of deforestation was very serious. It was then that a massive tree-planting programme was launched. By 1984 the programme was in full stride and 600,000 mu of forest was planted. This is the rhythm the region plans to maintain for at least the next fifteen years, and most officials are confident that in practice the target will be exceeded. Assuming the target is achieved, then by the end of this century Xinjiang will have 36.5 million mu of forest accounting for 1.5 per cent of the total area of the region.

In the past, tree planting was the responsibility either of the state farms or of the production brigades of a commune. Today, however, most of the trees are planted and cared for by individual households. The overall plan is drawn up by the Forestry Bureau of the Regional Government and this is then sent to the county governments, which are responsible for information and propaganda. Disaggregation occurs further at the township level and actual implementation at the level of the village or production team. Within the village each member of the labour force is expected to plant three to five trees a year voluntarily. Households supply their own saplings or seedlings, although in the case of very poor households these are supplied free of charge by the state. The death rate among new trees is quite low: only about 20 per cent die within a year of planting.

The most successful tree-planting programme in Xinjiang is in the Kashgar prefecture. Over the entire period since Liberation in 1949, about 1.4 million mu of natural forest have been destroyed, but 3 million mu of artificial forest have been planted, giving a net gain in the prefecture of about 1.6 million mu.

The total forest area of Kashgar is 5 million mu. This can be divided into several categories as follows:

RURAL DEVELOPMENT IN AN ARID REGION: XINJIANG

natural forest	2.0 million
windbreaks	0.7
fuel forests	1.0
orchards	0.6
anti-erosion forests	0.6
timber forests	0.1

This division is a little artificial since many forests serve multiple purposes, but it is clear from the data that the tree-planting programme recognises explicitly the need of the rural population for wood as fuel and it also recognises the connection between the provision of fuel and the control of the desert.

The success in Kashgar in mobilising 'voluntary' labour for tree planting on such a massive scale rests, in my judgement, on three pillars. First, communal institutions exist and are strong enough to organise the work force at the local level.

Second, the prefecture's Forestry Department provides technical assistance and, when necessary, the seedlings. Most important, it makes a modest cash payment to households for 'volunteering' their labour. In other words, there is a small monetary incentive to plant trees.⁹

Third, those who plant trees derive long-run benefits from their labour. Under the responsibility system, once the trees are planted their care is entrusted to individual households; these households then have the right to use the trees on an agreed basis, whether as a source of fuel, or timber, or fruit or foraging by livestock. Thus there is a direct link between effort and reward.

The oasis city of Turpan, with a population of 190,000, is protected by trees from the desert. There is an immense belt of trees five kilometres long and forty trees thick designed to protect the city from the strong north-western winds and sand storms that rain upon it during the winter months. In addition, 12,000 mu of shrubs (about five feet high on average) have been planted in the plains to fix the sand and 30,000 mu of tall trees (mostly poplars) have been planted around the sides of farms. It is intended to plant another 28-30,000 mu of trees during the next

⁹ Forests which are intended to be used jointly for fuel and feeding livestock have a planting density of 60 trees per mu. These forests often consist of plantations of Chinese 'date' trees. Sheep and goats are allowed to graze on the grass growing beneath the trees and on the leaves and 'dates' which fall on the ground in the Autumn. Wood from the trees is used for cooking. Such a forest would be irrigated three times a year, mostly in the Winter, with water surplus to requirements for crop cultivation.

fifteen years. The planting is organised by the township but the actual planting is done on a voluntary basis without remuneration.

Once the trees are planted their care is ensured in a variety of ways. In some cases specialised teams or households are created whose main task is to look after the trees and whose livelihood comes to depend on fee income earned from managing collectively owned forests. In other cases, a household enters into a contract to look after collectively owned trees. The contract would specify the number of trees (eg 10,000) and the year when they could be felled for timber or fuel (usually three to five years after planting). At the time of felling the household would pay one yuan per tree to Turpan city, who supplied the tree at that cost, and then divide the remaining sales receipts between the collective and itself in the ratio 40:60. In another variant, the collective (or state) instead of receiving 40 per cent of the net proceeds, receives a fixed sum to be paid at the time of felling. As part of the contract, the household would be required to replant the forest.

The city authorities carefully supervise those entrusted with protecting the forest. Permission must be obtained before trees can be felled and replanting is mandatory. The timing of replanting, the varieties planted and the frequency of watering are all controlled by the local government. Unauthorised destruction of trees is severely punished by fines. In addition, those guilty of such vandalism are subjected to public criticism and humiliation.

Quite apart from the oases, the state farms, particularly those located on the edge of the Tien Shan, have played an important role in reclaiming land from the desert and increasing the area under cultivation. A number of techniques have been developed since the work of reclamation began in the 1950s, but the most successful seem to entail constructing a wide zone of transition separating the desert proper from the cultivated fields. This zone of transition can itself be divided into several sub-zones.

Starting on the edge of the wilderness we have the desert of the Junggar basin, consisting of pebbles, sand and a few low sand dunes. The first sub-zone contains a belt of drought-resistant plants. These have been deliberately seeded but the plants are not watered: no one is allowed to gather fuel in this sub-zone nor are animals allowed to graze here. Next comes a belt of bushes, often tamarisk, which is planted to stabilise the sand. The vegetation in this sub-zone is irrigated once a year, usually in the winter. Behind this sub-zone of bushes and sterilised sand is a thick belt of trees, mostly poplars, which acts as a massive

windbreak and protects the land that is cultivated. The trees in this sub-zone are irrigated four times a year.

The cultivated fields sheltering behind the forest belt have, of course, been levelled and are served by a dense network of irrigation canals. Small windbreaks normally are interspersed among the fields and planted alongside the roads and canals. The area reclaimed from the desert by state farms in this way often is enormous. State farm No. 150 in the Shihezi region, for example, from which the above description is derived, covers an area of 231 km². It contains a forest area of 109,000 mu protecting a sown area of 160,000 mu and 1,183 km. of irrigation canals.

In some parts of Xinjiang attempts to reclaim the desert and expand the area under grain cultivation were carried too far, with the result that soil erosion, salination and desertification actually increased. This error is now recognised and efforts are being made to rectify the situation by converting some marginal grain land into grasslands or forests. In Kashgar prefecture, for instance, 60,000 mu of land formerly used to grow wheat was converted in 1985 into forests and orchards; another 60,000 mu of wheat is planned to be converted during the next four years.

Reforms on the state farms

There are more than twice as many state farms in Xinjiang, viz. 320, than in any other region of China, although the area cultivated (1.05 million ha.) is only 54 per cent as large as the area in Heilongjiang. The farms were started in the 1950s with the purpose not only of reclaiming the desert and expanding the area under cultivation but also of increasing population density in the sparsely settled regions along China's sensitive borders with the Soviet Union. The farms were organised by the army along military lines—with companies, divisions, etc.—and the workers were paid cash wages like any other employee of a state enterprise.

Living conditions in the first few years were harsh and uncomfortable, with workers living in tents or in pits dug in the ground, in remote, isolated areas with few services or amenities. In the 1950s many of the workers were ex-soldiers who settled in Xinjiang; then, during the period of the Cultural Revolution, many youths from the large metropolitan areas of eastern China were sent to work on the state farms; more important than both these groups, however, were peasants from other poor but densely settled regions of China. Over the last

Table 3: Land use in Kashgar Prefecture, Xinjiang
(million mu)

<i>Cultivated land</i>		6.6
irrigated	6.3	
unirrigated	0.3	
<i>Pasture</i>		36.0
natural pasture	33.8	
irrigated pasture	2.2	
<i>Forest</i>		5.0
natural forest	2.0	
artificial forest	3.0	
Total		47.6

Notes:

- (1) Only 0.6 million mu are double cropped. The sown area therefore is 7.2 million mu.
 (2) The total irrigated area is 8.5 million mu.
 (3) The grand total may contain some double counting because some of the irrigated pastures also contain trees and the land is jointly used for forestry and grazing.

thirty years, about a million peasants were moved to state farms in Xinjiang.

The organisation of the state farms remained more or less unchanged until about 1979, when reforms in the commune system throughout China began to affect thinking in the state farm sector. In the Shihez region, for example, contracts with individual companies, platoons or sections were introduced in 1979. Three years later, in 1982, the sections were sub-divided into groups and the state farm entered into contract with them. Most workers, however, still received a fixed wage equivalent to 80–90 per cent of their total income and only the residual 10–20 per cent depended on the output performance of the group. In 1983 the system was refined further and wages were linked entirely to output.

The reforms were carried a major step forward in 1984 when throughout China, the state farms were broken up into groups of household farms and agricultural wage workers were transformed into peasant cultivators or herdsmen. The nature of the contract varied slightly from one farm to another and from one economic activity to another, but the broad general outlines are clear.¹⁰

In the settled agricultural areas, contracts may be (i) with a single

¹⁰ The information in the text is based on practices followed by the Agriculture, Industry and Commerce Federation General Corporation of China, an umbrella organisation responsible for 160 state farms in Xinjiang.

household for a minimum of 50–100 mu per worker or (ii) with a small group of three or four workers for 500 mu of arable land or (iii) with a large group of, say, ten workers for anything between 1,500 and 20,000 mu depending on the nature of the land. The output quota typically is 90 per cent of the average of 1981–3 and is expected to be adjusted every five years. All output above the quota is kept by the household or group farm and once the quota is fulfilled the farmers are free to grow any other crop they want. Security of tenure is guaranteed for fifteen years. Finally, in addition to the contracted land, each household is allocated two or three mu for a private plot and house space.

In the livestock sector the arrangements are slightly different. The state farms usually do not sell the livestock to herders but simply entrust them to their care. The herdsmen are responsible under contract for meeting a quota of wool, skins, meat, etc. The households or groups are assigned a specific area of pasture in the hope that they will then have an incentive to improve the pasture by planting grass or trees and, where possible, irrigating the land with seasonally surplus water. In the good pasture areas the contract is drawn up in such a way that the state farm receives about 40 per cent of the output and the herdsmen 60 per cent. In very poor areas, however, the state farm may take nothing.

Some households, mostly ethnic minorities, specialise completely in raising animals for the state farms. The majority of households, however, particularly the Han, who are a farming people, prefer to concentrate on cultivating crops and regard livestock as a secondary activity. Such households often join together with similarly minded households to form a group to assume joint responsibility for a flock.

Finally, there are the contracts in areas being reclaimed from the desert. In these areas the state provides the roads, irrigation facilities and electric power and the individual household provides everything else. All output from newly cultivated land is kept by the household for the first three years. Thereafter the state receives a portion, the exact amount depending on the condition of the land.

The directors of farms have considerable discretion as how best to implement the reforms and this leads to variation in the degree of control exercised by the centre. For example, most land is distributed on an equal per labour force basis, but some farms (eg. state farm No. 150) allocate land on an equal per capita basis. Similarly, most directors encourage households to form groups or cooperatives in order to permit greater diversification of output and to spread risks, but some directors

are more sympathetic to small family farms. Again, most contracts now are fairly simple, concentrating on the output quota, but in a few cases (eg, state farm No. 121) the contract is very detailed, specifying not only the output quota, but also the type of seed to be used, the area of land to be cultivated, the amount of fertiliser and irrigation water and even the use of machinery. These detailed contracts are necessary, it is argued because many of the workers on state farms were highly specialised and lacked general farming knowledge and hence required careful guidance during the early years of the reform.

Lastly, the control of farm machinery varies. Some state farms continue to own and operate the major pieces of equipment; others have formed a specialised machine team or group which manages the equipment for the state under contract; while still others have sold machines to individual households or groups of households working as a cooperative. In all cases, however, the state farm is responsible for planning production of the major crops, setting output quotas providing technical assistance, transport and marketing services and managing the irrigation system. What it no longer does, and this is fundamental, is engaged in direct cultivation. In this sense, state farms no longer exist; they have been replaced by family farms and small cooperatives.

It is too early to reach a definitive judgement, but it appears that the reforms have contributed to a rapid rate of growth of agricultural output. The 18 state farms in the Shihezi region, for example, grew 11.1 per cent in 1984, the year after the reforms were completed, as compared to 8.0 per cent per annum in the period 1978-83. One year does not of course prove very much, but at least the outcome was encouraging. Similarly, average per capita income on the 160 state farms mentioned in footnote 10 rose from 460 yuan in 1983 to 570 yuan in 1984, in constant price terms, or by 23.9 per cent. Again, this is an encouraging outcome.

The effects on the distribution of income are less certain. The indications, however, are that inequality on the state farms has increased. First, the people on the state farms were workers, not peasants, and most workers had little if any experience of farm management. The specialised workers in particular sometimes found it difficult to adapt to their new role as all-round farmers and required special assistance. This, to be sure, is likely to be a problem during the transition only, and it should disappear in the long run, but meanwhile some households will experience a fall in their real income. Second

given that land usually was distributed on an equal per worker basis, rather than on an equal per head basis as in most communes,¹¹ existing inequalities would tend to be consolidated rather than reduced. Third, there are frequent reports that while 80 per cent of the people on state

¹¹ See Keith Griffin (ed), *Institutional Reform and Economic Developments in the Chinese Countryside*, London: Macmillan, 1984.

farms have experienced a substantial increase in income, about 20 per cent have suffered an absolute fall in their standard of living. Given that average incomes have risen, this almost certainly implies a less equal distribution around the average.¹²

Even so, the distribution of income within a state farm tends to be very equal. Moreover, where inequality is thought to be a problem, directors sometimes attempt to control inequality by adjusting a household's quota, as on state farm No. 121, or by adjusting the quotas of groups of households, as on state farm No. 151. Differences among state farms also appear to be relatively modest. The eighteen state farms in District No. 8 of the Shihezi region, for instance, tend to cluster within a fairly narrow range of incomes, as can be seen in Table 4.

Workers supplement their contract income with private income. Table 4 indicates that average private income is 232.76 yuan and accounts for 22.9 per cent of total income. The range of private incomes, however, is enormous and this component of total income is distributed very unevenly, as indicated by the high coefficient of variation. Unevenness in the distribution of private income, however, appears not to be reflected in unevenness in the distribution of total income. On the contrary, the range of total income is slightly smaller than the range of contract income and hence there is a hint in the data that in the Chinese institutional framework the existence of income-earning opportunities outside the collective sector may help to reduce inequality in the overall distribution of income.¹³

The pastoral economy

The pastoral economy of Xinjiang revolves around sheep, which account for two-thirds of all livestock. Next in importance come goats, followed by cattle and then horses and donkeys. In 1984 there were nearly thirty million animals in the region divided as follows:

¹² Most of the losers, however, were specialised workers and if they were paid more than the average worker, a fall in their income could conceivably be associated with a reduction in inequality. This seems to me to be rather improbable considering the narrow wage differentials one finds in China.

¹³ This hypothesis was first advanced when analysing the distribution of income in the commune sector. See Keith Griffin (ed), *op. cit.*

RURAL DEVELOPMENT IN AN ARID REGION: XINJIANG

sheep	20.00 million
goats	4.00
cattle	2.80
horses	1.00
donkeys	1.00
camels	0.16
pigs	0.70

Most of these animals, excluding the pigs, graze on natural pastures, of which there are 700 million mu suitable for grazing.

The pastoral economy is semi-nomadic. That is, the household often has a permanent base where the women and children live, but the menfolk and older boys move with the herds in well-established seasonal patterns. These patterns usually contain three grazing areas: one pasture used in the Spring and again in the Autumn, a Winter pasture and a Summer pasture. In some areas the distances covered can be vast. In Fu Yun county in the Altai region, for instance, the herds are moved about ninety times in the course of a year and travel 800–1,000 km.

The livestock economy is very extensive in its use of land and is fairly well adapted to the environment of Xinjiang. Productivity, however, is in general very low. One reason for this is an imbalance in the seasonal availability of pasture. The scarcity is partly due to natural conditions and partly to policy mistakes which resulted in grasslands being converted into wheat fields. As one authority has forcefully put it: 'In recent years, many fertile rangelands were blindly reclaimed for planting, and as a consequence the shortage of Winter–Spring seasonal pastures became acute.'¹⁴

Possible solutions to the problems of the livestock sector include (i) permanent settlement of herdsmen in towns, (ii) reconversion of marginal grain land into pastures and (iii) increased output from the existing resources employed in the sector.

Permanent settlement of the nomadic population may be a long-term solution, but for the time being it is unrealistic. An attempt forcibly to settle, say, half a million pastoralists would almost certainly lead to a decline in output in the sector and a fall in income of the pastoralists. Conversion of marginal grain land back to grazing land certainly is feasible and in fact is agreed policy. So far, however, reconversion has

¹⁴ Shen Chang-jiang, *Pastoral Systems in Arid and Semi-Arid Zones of China* (Pastoral Network Paper 13b) London: Overseas Development Institute, January 1982, p 11

been on a relatively small scale and it probably would be sensible to expand the programme considerably. It must be accepted, however, that even a large reconversion programme would not markedly alter the prospects for the livestock economy. A major improvement depends upon changes within the sector itself, and it is these changes which the economic reforms hope to encourage.

The keystone of the economic reform of the pastoral economy is the transfer through sale of livestock from collective to private ownership. Beginning in 1978, the collective units have distributed their animals to individual households on the basis of publicly agreed criteria. In most cases animals have been allocated among households in accordance with the size of household, on an equal per capita basis. In a few cases, however, allocation has been according to the size of the labour force in the household. Occasionally, too, a commune has adopted a combination of the two criteria. These reforms were virtually completed in 1984. It is noteworthy that the allocation criteria almost certainly imply a reduction in inequality among the pastoral population. The reason for this is that prior to the reforms a household's collective income was derived from work points earned by its able-bodied workers. Today, however, to the extent that livestock are allocated on a per capita basis, a household's income from grazing is a function of its total size rather than the size of its labour force. The price at which livestock are sold to households is higher than the price at which the communes could sell animals to the state but lower than the price at which households can purchase animals in the free market.

The average size of herd received by households has varied enormously from one part of Xinjiang to another. The average per household is about 100 head, but the maximum is more than 500. At the other extreme some households received as little as four animals per person, especially when the household also engaged in farming and regarded livestock as a minor activity. Predominantly pastoral households seldom have fewer than fifty animals. Once the initial distribution of collective livestock was completed, households were free to buy and sell animals as they wished.

The grasslands remain under collective ownership. Each household, however, is allocated several pieces of pasture land—one in each seasonal location—for which it is responsible under contract. The amount of land received by each household depends on the size of its herd. The location of each household's pieces of land—an important consideration in a semi-nomadic society—is decided by the collective in

public discussion. Often groups of households pool their land and manage their herds as small cooperatives and in this way they are able to take advantage of economies of scale in grassland management and improvement schemes.

The reformed livestock sector thus has three levels of organisation and ownership. The animals are privately owned by households. The pastures, although allocated to individual households, in practice frequently are managed by cooperatives, while the land itself continues to be collectively owned.

The contract between a household and its collective has two parts. First, the household must pay to the collective one or two yuan a year for each sheep or other animal it owns. This is intended to cover the collective's tax liability and its management costs and to sustain the collective accumulation and welfare funds. Second, the household is required to sell to the state 7–8 per cent of its animals each year at the state purchase price. The state marketing rate is not fixed, but is determined periodically after discussion between state organs (at region, county and township levels) and, ultimately, households. Statistically, the gains have been impressive. The number of animals has increased from 24 million in 1978 to 30 million in 1984, an increase of 25 per cent in six years. The average weight of a sheep during the same period rose from 13 kg. of dressed meat to 15 kg., a rise of 15 per cent. The marketing rate increased by nearly a third, from 9.9 per cent in 1978 to 13 per cent in 1984, and the marketing rate of livestock sold on the free market (where prices are much higher) rose from 2–3 per cent to 5–6 per cent, ie, it probably doubled. As a result of these changes, living standards among the pastoral population have increased considerably and the acute poverty that once afflicted the nomadic people is rapidly disappearing.

Conclusions

Xinjiang demonstrates that arid regions are not necessarily condemned to poverty and backwardness. Its experience shows yet again that deserts are partly man-made. Poor economic policies, neglect and abuse of the natural environment, can lead quite quickly to erosion, degradation of the soil, destruction of the forest cover and even micro-climatic change. Happily however, Xinjiang also shows that these processes can be reversed. It requires enormous effort and

progress inevitably is slow, but the desert can be reclaimed and a viable and prosperous economy created.

The success in Xinjiang is due in part to support from the central government, and particularly to the generous provision of resources necessary to sustain high rates of investment in mining, transport, power and irrigation. The institutional arrangements that have evolved in recent years all appear to have been successful. Households are now responsible for farming throughout most of the region, but communal institutions still exist and seem to function reasonably well. They are particularly important in managing irrigation systems and ensuring an equitable distribution of water and, as voluntary cooperatives, in managing collectively owned pasture land.

Clearly, from the point of view of efficiency and growth, the current economic policies are superior to those, say, of the mid-1970s. Growth, however, is not the only consideration, although it obviously is an important one. We are interested, too, in poverty and inequality.

In China as a whole we know that in the period 1978 to 1984, the real income of peasants rose very much faster than the real income of workers, viz., 15.0 per cent per annum as compared to 8.2 per cent. As a result, rural-urban inequalities diminished sharply.¹⁵ Even so, the overall distribution of household income became less equal, although the degree of equality in China remains very great compared to most other Third World countries. Official data indicate, for example, that the Gini coefficient[†] for household income rose from 0.237 in 1978 to 0.264 in 1984.¹⁶

Table 5: The distribution of income among households
(Gini coefficients)

	1978	1984
Peasants	0.250	0.288
Workers	0.185	0.169
All households	0.237	0.264

Source: Li Chengrui, 'Réforme du système économique et amélioration du niveau de vie', *Beijing Information* 23(29) 22 July 1985.

¹⁵ Li Chengrui, 'Réforme du système économique et amélioration du niveau de vie', *Beijing Information* 23(29), 22 July 1985, pp 18-24.

¹⁶ Note, however, that the coefficients refer to total household income not income per head. If households with large incomes also tend to be households with a relatively large number of members, as seems likely, the coefficients in the text exaggerate the degree of inequality among persons. It is less likely, however, that changes in the coefficients are misleading as to trends in inequality.

[†] A measure of the degree of inequality.

Within the urban areas the wage reforms seem actually to have reduced inequality among households of workers, but inequality among peasant households increased during the six-year period¹⁷ and it is this that accounts for the rise in the overall Gini coefficient.

Unfortunately, it is not possible to be precise about trends in the rural areas of Xinjiang. As indicated above, it is likely that in the pastoral economy the economic reforms have contributed to a reduction in inequality. On the state farms, in contrast, inequality has probably increased. Not every state farm worker has proved to be a good peasant farmer and consequently the income of some households has fallen considerably. The result, inevitably, has been a greater variation of incomes around a higher average level of income.

The situation in the oases is even more complex. Collectively owned land was distributed among members of communes largely on a per capita basis and hence the initial impact of the reforms was strongly egalitarian. Recently, however, the rules governing employment of labour by households and private accumulation of the means of production have been relaxed and this has created opportunities for enterprising households to establish large and sometimes very profitable businesses.

For example, one household visited in Turpan established a grape-canning factory in July 1985. At the time of our visit in September there were eighty employees, with an additional twenty employees expected to be hired in the near future. The design capacity of the factory was 100,000 jars of grapes a day and the planned profit was 300,000 yuan a year. This, obviously, was an unusual and perhaps even unique case. It is significant, however, in that large private factories are now allowed, whereas previously factories of such a size would have been organised as a cooperative.

High private profits from factories owned by households will, of course, result in a few very high incomes at the top end of the distribution. The profits mentioned above are truly exceptional, but rich peasant households—in the so-called 10,000 yuan households—are

¹⁷ Li Chengrui, *op cit*, does not contain Gini coefficients for peasant households. We have therefore inferred the values using the formula

$$G_t = 0.2G_w + 0.8G_p,$$

where G = Gini coefficient and the subscripts t , w and p refer to total, worker households and peasant households, respectively. (Note that in 1982, 20.8 per cent of the population lived in urban areas.)

Table 6: Measures to reduce poverty in Turpan

<i>Type of assistance</i>	<i>Amount of assistance</i>	<i>Number of beneficiary households</i>
(1) Increase production		
(i) Cotton and wheat seeds	110,000 jin	900
(ii) Fertiliser	70 tonnes	370
(iii) Small agricultural implements	n/a	300
(iv) Sheep	400 head	100
(v) Donkey carts	900 carts	900
(vi) Interest-free loans	300,000 yuan	n/a
(2) Maintain consumption		
(i) Food grains	300,000 jin	Enough to support fully 750 persons
(ii) Cloth	60,000 yuan	n/a
(iii) Free medicines and medical care	n/a	1,470
(iv) Excused payment of agricultural tax and contribution to collective accumulation and welfare funds	n/a	1,470

not uncommon, and their presence is a clear signal that greater average prosperity has been accompanied by greater inequality.

One must be careful, however, not to exaggerate the changes that have occurred in the distribution of income. Dramatic gains by a tiny minority of very prosperous households are highly visible, whereas improvements at the bottom end of the distribution can easily be overlooked. The community still assumes responsibility for meeting the basic needs of all families and the five-guarantee programme[†] still operates. Moreover, the level of support to poor households has been increased broadly in line with the rise in average incomes.

A distinctive feature of Chinese policies to combat poverty is the emphasis placed on increasing the production potential of households; relatively less emphasis is placed on transfer payments designed to maintain the level of consumption. Consider, for instance, the case of Turpan city (see Table 6).

As can be seen in the table, assistance given to 'difficult households' to increase production took several practical forms, and not listed, from August 1985 the city decided to give members of 'difficult households' priority in employment in state enterprises and, additionally, to help 'difficult households' to transform themselves into 'specialised households'. The objective of the city is to solve the problem of poor households within two years.

The final impression, thus, is that in Xinjiang the economic reforms have been accompanied by some increase in inequality in the rural areas, particularly on the state farms, but the incidence of poverty has clearly declined. Compared to other arid regions in the world, above all, of course, to the arid regions of Africa, Xinjiang has done exceptionally well. Where many countries have experienced agricultural stagnation, declining incomes of the peasantry and mass famine, Xinjiang has enjoyed rapid rural development. Success has owed little to the generosity of nature. Indeed, in few places on earth is the natural environment less promising or the achievements more impressive. Xinjiang shows that a prosperous countryside can be created under unfavourable circumstances and this demonstration can be a shining example to many millions of people everywhere.

[†] These are: 1) adequate nutrition 2) sufficient clothing 3) shelter 4) basic education 5) a decent burial.

Dependency, land and oranges in Belize

Logwood, mahogany and land tenure¹

Lacking mineral resources and concentrated centres of population, and placed ambiguously between the jurisdictions of the Captains-General of Yucatán and Guatemala, Belize in the mid-seventeenth century was of little interest to the Spanish colonial empire. It therefore formed a perfect base for British buccancers raiding Spanish shipping. After the 1660s the settlers turned their efforts to the exploitation of logwood, a large shrub much in demand by the European wool industry for use in dyeing, which commanded a price of £100 per ton.²

The Spanish Crown finally recognised the right of the settlers to cut logwood in 1763, by which time the enterprise was in decline due to overstocking in Europe. The 'Baymen', as the settlers were known, turned instead to mahogany logging. The Convention of London of 1786 recognised the claim by the Baymen to exploit mahogany as well as logwood (within territorial limits which in practice were already being ignored) but precluded permanent settlement or agricultural production.

The first logwood cutters determined land ownership by 'location', by which they meant simple occupation of a plot of land. When greater formalisation became necessary in 1767, a Public Meeting agreed that locating a hut in an uninhabited logwood area, invariably on a river since there was no other means of transport, would establish rights over 1,000 yards of river bank to each side, reaching back halfway to the next navigable river, provided that the logger held no other location on the same river. Despite this rule, an inquiry by the Superintendent twenty years later revealed that fifteen individuals had secured title to four-fifths of the logwood locations by the expedient of registering the

¹ This and subsequent historical material follows the accounts in N Ashcraft, *Colonialism and Underdevelopment: Processes of Political Economic Change in British Honduras*, New York: Teachers College Press, 1973, Chapters 3-5; N Dobson, *A History of Belize*, London: Longman 1973, chapters 3, 4 and 8; C H Grant, *The Making of Modern Belize*, Cambridge University Press, 1976, chapters 1 and 2.

² Grant *op. cit.*, p 30.

land in the names of their servants. The rules were altered to allow two holdings per river, and in view of the greater forest area needed for the exploitation of mahogany, the river frontage was increased to a total of three miles.

A commission appointed by the superintendent of the colony in 1820 found that all the valuable 'works' (as the larger mahogany locations were called) had been allocated, and that some individuals still controlled eight to ten holdings. Ownership by location was abolished, and existing tenants were granted the freehold, other land reverting to the Crown. In subsequent years a number of larger grants of Crown Lands were made, a policy which further concentrated the pattern of land tenure as smaller holdings 'by location' showed a tendency to be swallowed up by larger grants surrounding them. Boundary disputes continued until the establishment of the Lands Title Registry in 1859, but even by 1838 the large landowners were strong enough to ignore a proposal to introduce a fee for land grants since they already possessed the freehold on all the most valuable land in the country, the accessible and mahogany rich lands to the north, and could do without further grants.

The rise of the merchant elite

Forestry dominated the early nineteenth-century economy. Logwood continued to make some contribution, but the 'crop of dependency' was mahogany. Demand was kept buoyant by shipbuilders and the fashion for Chippendale-designed furniture, but even by 1810, when exports reached over 7¼ m board feet,³ there were signs that the haphazard destruction of the forest along the rivers would lead to difficulties in the future. In 1805, the loggers had been forced to import oxen from Honduras to aid in extracting timber from the more inaccessible areas to which they were driven. These operations raised costs, and rendered the loggers more exposed to periodic fluctuations in prices. The landowners were therefore always eager for sources of further income, and since there existed a constant need to import foodstuffs for the forestry labour force, import/export trade provided obvious possibilities.

After the Central American Federation achieved independence from Spain in 1823, Belize provided the main trading route to Europe for twenty years. One estimate puts the proportion of Central American

³ Dobson *op. cit.*, p 129.

trade passing through the settlement as high as three-quarters. In 1839 Under-Secretary James Stephen commented that it 'carries on a very large and valuable smuggling trade with Central America. This constitutes the real value of the place.'⁴ Equally significant was the entrepôt trade with the Yucatán. The volume of business was sufficient to attract a number of London merchants into partnership with the landowners, so that the elite acquired a dual basis of domestic forestry and metropolitan mercantile interests.

As the republics of Central America became more securely established, the importance of Belize declined, so that by the 1840s trade revenue was falling. In addition civil war in the Yucatán from 1846–8 further disrupted the market. Although some Belize City merchants attempted to make the best of the situation by selling arms to the Santa Cruz Maya rebels, it was the boom in demand for mahogany caused by the expansion of railways in Europe which postponed the inevitable conflict of interest between the domestic and metropolitan elites. In 1846 mahogany exports reached 13 m board feet.⁵ Depression again gripped the settlement in the 1860s. The peak of railway development had passed, and trade with the US was disrupted by the Civil War (1861–5) (which did however provide a further opportunity for profitable gun-running) and by Belize's transition to colonial status in 1862, which brought it fully within the ambit of Britain's system of imperial preference.

In 1871 the monopoly power exercised by the landowning elite throughout the history of the settlement by means of its dominance of the Public Meeting and the locally elected Legislative Assembly was broken, when executive power was devolved to a Legislative Council directed from London as part of the transition to Crown Colony status. Economically, this development was paralleled in the after-effect of the collapse of European mahogany prices. Without mercantile revenues to cushion the shock, many of the trading houses found themselves in difficulty. As the strong foreclosed upon the weak in the wave of bankruptcies which followed, land ownership became increasingly concentrated under the control of the metropolitan merchants.

By 1870 the bulk of private land was in the hands of 4 owners, the two largest, Young, Toledo and Co. and the British Honduras Company holding some two million acres. The latter was based upon the holdings

⁴ Dobson *op. cit.*, pp 139–41.

⁵ Ashcraft *op. cit.*, p 37.

of James Hyde, one of the original monopolists identified in 1785. In the 1820s the firm became linked with James Hodge of London, the partnership passing into the hands of the powerful London banking family of Hoare in 1875, changing its name to the Belize Estate and Produce Company (BEC). When Young, Toledo and Co became insolvent in 1880 the bulk of its lands were purchased by BEC.⁶ Thus, by the turn of the present century forestry and trade were dominated by a single company, alien-owned, whose holdings encompassed one-fifth of the total land area of the country, one-half of the lands in private ownership, and almost all of the prime mahogany forest.⁷

Commercial agriculture and the Great Depression

Enforcement of the ban on agriculture in the treaties with Spain suited both the British government, anxious to avoid unnecessary diplomatic wrangles, and the forestry elite, who saw it as a threat both to the labour force for the mahogany works and to the profitable trade in foodstuffs imported for their commissaries. The first serious attempts at agricultural production were the result of two waves of immigration, the first by Garifuna⁸ from the Bay Islands into the south of the country in the 1820s, and most importantly by mestizo and Maya refugees from the civil war in the Yucatán in the 1840s. By 1861, the population of the northern Corozal district exceeded that of Belize City. These new populations, marginal to the interests of the forestry elite and accustomed to agricultural labour, quickly seized upon the developing market opportunities abroad. Few of the enterprises lasted long; the sugar industry in the north was doomed by low prices in the 1880s. Coconuts provided a more durable source of revenue; it was not until after World War II that falling prices, neglect of the plantations and hurricane damage led to the decline of the industry from its peak export figure of 8,268,530 nuts in 1915.⁹

The development of a banana export industry around the Stann Creek valley was at first most successful. In 1891 half-a-million stems were despatched to the US through the United Fruit Company, and by 1906 the total had risen to three-quarters of a million stems of bananas

⁶ P Ashdown, 'The Belize elite and its power base', *Belizean Studies* 9(5 & 6) 1981, pp 38-9.

⁷ Grant *op. cit.*, p 37.

⁸ *Garifuna*: descendants of intermarriage between escaped slaves and Carib Amerindians

⁹ D H Romney (ed), *Land in British Honduras*, London: HMSO, 1959, p 119.

and 2 million of plantain, the latter for the most part produced by Garifuna farmers on small plots. In 1911 United Fruit began production on its own account on 12,500 acres, but two years later the plantations were struck by an outbreak of Panama disease, and thereafter the industry went into decline. United Fruit's production, 887,000 stems in 1917, had fallen to a mere 79,000 by 1932.¹⁰

Agricultural exports remained merely a palliative as successive slumps struck forestry exports, sinking the colony deeper into depression.

A brief resurgence of logwood exports in the 1880s preceded the entire collapse of the trade due to competition from cheaper aniline dyes. The supporting role of logwood in the forestry economy was taken by chicle, the processed sap of the sapodilla tree used for chewing-gum base. Mahogany exports surged upwards once more at the beginning of the century following an increase in demand in the US, but soon fell back once more. The introduction of tractor haulage in 1924 enabled previously inaccessible stands of timber to be reached, but unit costs remained uncompetitively high compared with alternative sources of hardwoods in Brazil and Africa. Mechanisation also accelerated the reduction of labour employed in forestry, reinforcing the domestic effects of the slump. As early as 1921 the balance of trade moved into deficit,¹¹ where it has remained to the present. The collapse of mahogany and chicle prices in the 1930s had a catastrophic effect, accentuated by the disastrous hurricane which struck Belize on 10 September 1931. The extent of the crisis can be gauged by the fact that in 1929 10 per cent of the revenue of the administration was derived from duties on whisky destined to be smuggled into the US, which was under Prohibition from 1920 until 1933.¹² By 1931-2, the proportion had risen to 11.75 per cent of revenue and fully 75 per cent of export duties.¹³

Despite the critical revenue situation, the landowners successfully pressed for a reduction in the tax on chicle in 1933, by which time BEC had established the country's first sawmill, using BH\$200,000 of hurricane relief loans. Loans for agriculture, on the other hand, were hard to raise. In the following year, the tax on sawn lumber was abolished. As BEC's operations pressed deeper into the inaccessible

Hillbank area, the villages of Indian Church, Xaxe Venic, San José and Yalbac were depopulated.¹⁴ When the administration attempted to raise land taxes in 1931, BEC and the other large owners simply refused to pay; in 1934 BEC settled its debt (of \$115,000) by making over to the government some land 'of indifferent value.'¹⁵ After a slight remission in 1939, recession deepened still further when the US entered World War II in 1941, which led to further restricted exports and rocketing food prices. The immediate post-war years were no better, reaching a nadir in 1949 after a severe drought. The British decision to devalue the British Honduras dollar on 31 December 1949 somewhat eased the competitive position of exports, but the widespread hardship caused by the further increase in food prices was a major influence, as has been well documented,¹⁶ in the formation of a political movement pressing for independence.

The struggle for independence: the domination of sugar

Politically, the forty years following the end of World War II were characterised by the hegemony of the People's United Party (PUP) under its leader, George Cadle Price, and the struggle for self-government and independence, finally granted on 21 September 1981. In the economic sphere, the decline of the forestry-based economy dominated by the BEC was mirrored by the rise of an economy based upon sugar as the crop of dependency under the control of the British multinational Tate and Lyle.

Commercial sugar production was reintroduced in the 1930s on the initiative of Governor Kittermaster, over the opposition of the timber elite and the Colonial Office. 'Your coolness towards these proposals,' he complained in 1934, 'is contrasted unfavourably in the local mind with your attitude last year in urging on the Legislative Council the advisability of making a loan to Sir Samuel Hoare's Belize Estate and Produce Company.'¹⁷ A second-hand factory was installed at Pembroke Hall (now Libertad) near Corozal in 1935. After the war, while timber revenues remained static at around BH\$3.5 million per annum, sugar exports expanded rapidly. In 1960 over 12,000 tons went to Britain under the Commonwealth Sugar Agreement; in the following

¹⁴ Romney *op. cit.*, p 205.

¹⁷ Quoted in A Ford, *Telling the Truth*, London: Karia Press, 1984, p 4.

year with export revenue of BH\$4,022,000 from 27,577 tons, sugar permanently replaced timber as the country's primary export earner.¹⁸ The company was bought by Tate and Lyle, who renamed it Belize Sugar Industries (BSI). The Libertad factory was overhauled and a new plant built at Tower Hill. Production topped 50,000 tons in 1966-7 and 100,000 tons in 1977-8.¹⁹ Revenue that year (BH\$47,719,000) represented 54 per cent of exports, while timber and chicle combined contributed a mere 3 per cent.²⁰ Over the same period acreage of cane harvested quadrupled to 60,000 acres.

The old forestry and mercantile interests continued to control the land. Of the land in private ownership in 1954, only 10 per cent of 'readily farmable soil' was in use for permanent cultivation, with a further 30 per cent leased for *milpa*.²¹ Large holdings accounted for 94 per cent of privately held land. Since mahogany profits had been reinvested abroad, especially in the US, the owners not only lacked capital but often were 'unable' to meet their annual land tax payments. The British Government Land Survey concluded: 'It is difficult to suggest a remedy which does not involve cutting down the size of the estates severely.'²² By 1966, 90 per cent of privately owned lands were in the hands of foreigners. Of the 365 owners whose acreage exceeded 100, almost half were foreign and their holdings totalled 2,136,000 acres. The Belizean majority held only 234,000 acres. Of the 2 million acres owned in lots of 10,000 acres or over, only three out of fifty owners were Belizean.²³ Still pre-eminent was BEC, which had been acquired in 1947 by the British timber combine, J Glicksten and Sons.²⁴ The company sold some land, but in lots of over 5,000 acres at a speculative price which put it beyond the reach of domestic farmers. The new owners, for the most part from the US, continued to hold the land in speculative inactivity.²⁵ By 1968 BEC's lands had been reduced to 872,412 acres. In the 1970s Glicksten was itself acquired by the International Timber Company (ITC). Shortly before merging with Montague L Meyer to form Meyer International, ITC sold BEC along

with its other tropical timber operations 'considering that there was no future in them.' (Meyer International still owns the Sibun Land Development Company.²⁶) The purchaser, for a price of US\$4.7 million, was a financier from Georgia, F W Bellote.²⁷

The government's first attempt to exert some degree of control over land speculation, a tax on undeveloped land introduced in 1966, had little effect. Of wider importance was the Aliens' Landholding Ordinance (No 31 of 1973) which prevented the acquisition by non-Belizeans of more than ten acres of rural land, except where the Minister of Natural Resources had used his discretion to 'grant to an alien a licence to acquire and to hold an estate in land subject to such terms and conditions in the licence as he may think fit for the development of the said land.' (Section 6(1)) The following year, the government passed legislation enabling it to acquire land in the public interest.²⁸ The government's greatest success in the recuperation of land was in 1972 in persuading Tate and Lyle to sell its lands, on which it had grown 50 per cent of its sugar cane requirements, to small farmers in return for a levy on cane deliveries.²⁹

The government also encouraged agricultural expansion in other areas. Under the stimulus of producer cooperatives, exports of fish, especially lobster, expanded rapidly, reaching 10 per cent of exports by the 1980s.³⁰ Banana exports resumed in 1975 through United Fruit/Fyffes; despite transport difficulties and falling production since 1979, revenues have remained good due to favourable prices in Britain. A third growth area was citrus.

A cooperative exporting fresh fruit had existed in the Stann Creek area, which is perfectly suited for citrus, before World War II when lack of markets finished it. The enterprise was based around the plantation of the Jamaican company, Sharpe Bros, and local growers turning away from bananas. The industry revived after the war due to a ten-year contract with the British Ministry of Food. Acreage under citrus increased from 100 acres in 1950 to 6,000 acres in 1965, stimulated especially by the planting of a 2,000 acre grove by Salada Foods of Canada. A mini-boom in the 1960s, caused by severe frosts in Florida, benefited for the most part only the five or six largest growers and the two

foreign-owned processing plants; the small growers, unable to bear the costs of maintenance in years of low prices, tended to allow their grove to deteriorate. Nevertheless, by 1982 acreage was up to 10,000 acres and citrus also contributed 10 per cent of export revenues.³¹

A further 10 per cent was contributed by the garments exported by the US-owned Williamson Industries, an 'offshore' plant established in 1961.

The economy in 1984-5

Despite these successes in diversification, when the PUP left office in the General Election of December 1984 the economy remained in deep crisis. The 1984 trade deficit of Bze\$69.4 m represented an imbalance of imports to exports of 4 to 3, almost a quarter of imports being accounted for by food and beverages.³² Sixty per cent of productive agricultural land remained foreign-owned and largely unexploited.³³ Critical levels of unemployment and poverty were only kept at bay by emigration of large numbers of Afro-Belizeans to the US, and their remittances home of US dollars. Estimates for the scale of the migration range from a commonly accepted 30-50,000 to 90,000.³⁴ In a natural succession to the bootlegging of the 1920s and 1930s, some Belizeans began to exploit the ready market in the US for marijuana, especially during 1984 when domestic political pressures forced the Price government to stop the aerial spraying of plots with paraquat herbicide. Estimates put the value of the trade at at least \$100 m, equal to the total legal exports, though few of the profits remain in the country. By early 1985, Belize was believed to be the fourth largest producer of marijuana in the hemisphere.³⁵

Debt repayments forced Belize to the IMF for the first time in mid-1984. In order to stave off imminent devaluation, the new United Democratic Party government of Prime Minister Manuel Esquivel quickly negotiated a US\$13 m loan from USAID, in addition to US\$7 m in Special Drawing Rights from the IMF. The former

committed it to the abolition of quantitative import controls and to the generation of a volume of extra trade with the US equal to the value of the loan.³⁶

Legal exports remained dominated by sugar, which accounted for approximately half of export revenue and arable land acreage and a quarter of employment and GDP.³⁷

With the world market price of sugar at an all-time low, the industry was reliant upon quota sales to the US and EEC. In volume terms, the 42,000 ton EEC quota under the provisions of Lomé III was most important, yielding an average of Bze\$600.63 per ton compared with Bze\$236.54 on the open market in 1984–5, but the depreciation of the pound sterling against the dollar since 1980 gave rise to a notional loss in revenue over the period of Bze\$200,000 compared with constant 1980 exchange rates. In revenue terms, the US quota introduced for the 1982–3 season and reduced to 24,500 tons for 1984–5 and 16,500 tons for 1985–6 was more significant, yielding an average Bze\$841.49 per ton.³⁸

The contraction of the Belize sugar industry was spectacularly swift, and followed the decision by the new government not to carry through a Letter of Intent signed by the previous administration to buy out Tate and Lyle's majority shareholding in BSI. Negotiations proceeded through May and June 1985, the multinational pressing extremely harsh terms backed up with a threat to close the industry completely. The Libertad factory was closed, and reduced production of 80,000 tons was transferred to Tower Hill. All but 10 per cent of Tate and Lyle's holding was transferred to a trust on behalf of the remaining employees in return for any dividends declared over ten years. The multinational retained a management contract, and acquired a licence to import 5,500 tons of plantation white sugar in 1985–6 to satisfy the domestic market.³⁹ As the Minister of Trade commented, 'Tate and Lyle are in a position to make demands on the government and the resources of the country, and the government has little alternative but to go along.'⁴⁰ For its part, the company claimed that the sale 'has allowed necessary commercial decisions to be taken that would have been extremely difficult for foreign owners of such a key industry in the Belizean economy. In

addition, the industry could now qualify for assistance from international lending agencies.⁴¹

The disastrous effect of the closure of the Libertad factory on the relatively prosperous Corozal district was received rather stoically. A former union official at the factory summed up the historical situation succinctly: 'Just like mahogany, chicle has its time, sugar has its time—and it's come already.'⁴²

As can be seen from Table 2, all of the alternative export industries are heavily dependent on the US market. Two crops at present insignificant but with growth potential—cacao and winter vegetables—are 100 per cent US controlled. The cacao programme is managed by the Hershey Corporation, which buys all the crop, and the vegetable trade is a development of the Caribbean Basin Initiative and puts Belize into direct competition with most of the other nations of Central America and many Caribbean Islands. Exports in the first season (1984–5) totalled 344,624 pounds, making the sector the fastest growing in the economy; proceeds were a mere Bze\$23,700 due to adverse transfer pricing by Miami corporations.⁴³ Tourism, another growth area, is also dependent on the US, both for visitors and the development of resort facilities.

The only possibility for short-term expansion lay in citrus. The structure of the industry had changed little since the 1960s. Of the Citrus Growers Association's 375 members, 90 per cent farm under four acres, while 36 per cent of the groves are owned by the processors.⁴⁴ Salada had passed through the hands of Kelloggs into the ownership of the Swiss giant Nestlé (Belize Food Products), while in 1983 Sharpe Bros sold 90 per cent of their interest in the Citrus Company of Belize to a consortium headed by the Citrus Growers Association of Trinidad (50 per cent) and local farmers, effectively resolving a damaging price dispute between growers and processors. Between 1979 and 1983 exports almost doubled, with acreage rising by 1000 per year. Loans for citrus development accounted for 22 per cent of all agricultural loans (Bze\$3.5 m), increasing by 8 per cent at a time when agriculture loans as a whole dropped by almost one-third.⁴⁵

⁴⁵ *Inforpress*, 24 January 1984.

The British Overseas Development Administration finances an agronomist and a programme for the improvement of neglected groves, drainage and fertiliser projects and a nursery.⁴⁶ The aid package negotiated in London in July 1985 included a feasibility study for a 30,000 acre grove in the southern Toledo district (compared with the 9,000 acres in Stann Creek.)⁴⁷

Two factors contributed to the boom. Severe frost damage in Florida from 1980 to 1984, together with the reappearance of citrus canker, led to soaring prices for orange juice concentrate, which reached a high of US\$1.75 per lb in January 1985. In addition, the provisions of the CBI removed a 30 per cent tariff from Belizean exports to the US, enabling Belize to compete for the first time with the world market leader, Brazil. But during 1985, the pace slackened as the Florida industry recovered and world prices fell. Belizean production for the second quarter was only 0.6 per cent down on the same period in 1984, but revenue fell by 14 per cent.⁴⁸ By the end of the year, Brazil had cut its export price by one-third and the New York delivery price had fallen to below US\$1 per lb, while production in Florida was expected to be up by 27 per cent.⁴⁹ As in the 1960s, the effects of the price fall seem likely to hit the small growers the hardest; an article contributed to the newspaper *Amandala* complained of domination of the Citrus Growers Association by large growers and representatives of the processors under a regulation which restricts membership of the Board of Directors to growers who have produced 'at least 15 per cent of the fruit delivered for processing during the previous year.'⁵⁰

In October 1985 the whole pattern of both the citrus industry and the Belizean economy was radically altered, once again through the agency of the lands of the Belize Estate and Produce Company.

The 'Coca Cola' land deal

The US owner of the BEC lands found the burden of land taxes too great; in 1982 he sold out to a Belizean businessman, Barry M Bowen, head of a substantial trading empire, for \$7 m including \$2 m in back

⁴⁶ Minister of Natural Resources, Speech to the Citrus Growers Association, *The Beacon* 21 September 1985.

taxes. During the post-war period a logging railway had been extended to beyond Gallon Jug to facilitate mahogany extraction, but the area still contained an estimated 4,592,700 cubic metres of exploitable timber including 444,000 cubic metres of primary hardwoods and the country's 'richest reserve of mahogany'.⁵¹ The Gallon Jug settlement was abandoned in 1965.

Bowen intended to clear 120,000 acres over six years to fuel a wood-burning power station and a pulp mill, replanting 20 per cent with fast growing species such as eucalyptus and selling off the rest as cattle pasture or for citrus. When backing for the scheme from international agencies was not forthcoming due to profound concerns over environmental damage and doubts as to the scheme's economic viability, Bowen found himself in difficulty servicing the US\$4.8 m loan he had taken out from the Banco Metropolitano SA of Panama to finance the purchase.⁵² In February 1985, the Supreme Court of Belize ruled him liable for the debt, rejecting an intervention by the Attorney General who argued a prior claim by the government in lieu of unpaid taxes.⁵³ The implications of the rescue negotiated by Bowen and finally announced on 2 October 1985 were enormous.

A US\$6 m deal involved the whole of the BEC lands, 686,186 acres, 'the largest single piece of potentially arable land in the whole of Central America,' one-eighth of the land area of Belize. The US involvement represented both the largest investment from abroad since independence and the largest single foreign investment by a US company in a nation covered by the CBI.⁵⁴ 50,000 acres were bought outright by Minute Maid, Coca Cola's juice subsidiary; 50,000 acres by a partnership between two Houston businessmen, Walter Mischer and Paul Howell; and 50,000 acres was retained by Bowen himself. The remainder, over half-a-million acres, is owned jointly on a 30:30:40 basis. In addition, lands in the New River Lagoon area were made over to the government to cover some B\$800,000 in land taxes.⁵⁵

Coca Cola will establish a 5,000 acre citrus nursery, rising over seven years to 25,000 acres. Total investment is estimated to reach US\$120 m, close to the present GDP of US\$158 m. In the short term, exports of citrus are expected to quadruple.

DEPENDENCY, LAND AND ORANGES IN BELIZE

The multinational will benefit in a number of ways. Minute Maid, the US market leader in orange juice with a market share of 20-25 per cent, is the largest grower in Florida with 22,000 acres, supplementing its needs with imports primarily from Brazil. The Belize operation will be free from fears of frost and disease problems, and will also escape the producer/processor disputes which affect Brazilian output since no plans have been announced for the company to purchase fruit from Belizean growers. Its shipments of fruit for processing at its two Florida plants will benefit from the CBI tariff advantages, worth almost \$2 per box, a reduction also applicable to the output of the processing plant it may establish in Belize after 1990 if production warrants it.

Belize will benefit from such swift replacement of the gap left by Tate and Lyle, and, in the words of Prime Minister Esquivel, be an 'example to other companies and firms looking for a good environment in which to locate their projects',⁵⁶ since the foundation of the UDP's economic strategy is the attraction of private foreign investment. The project will also impart stability to the citrus sector, at present vulnerable to price

* *The Beacon*, 5 October 1985.

changes and dependent on the CBI, due to expire in 1996, for competitive advantage. But the clear danger remains that the involvement of Coca Cola will be limited to that of an offshore agro-industry reminiscent of the plantation economies of colonial times. Officially the direct benefits are listed as 'improvement in infrastructure, increase in employment and the training of specialised skills to nationals.'⁵⁷ The government will generate most of the infrastructure improvements itself, using part of the British loan of June 1985; employment at full production will be 800 permanent and 1,500 casual staff, while the training requirement is a condition for the granting of a fifteen-year tax holiday, any application for which would reduce severely the revenue from the investment to the hard-pressed Treasury, under Belize's investment incentives laws.⁵⁸

A new elite?

The main concern over the transaction is that other than for half of Coca Cola's holding, it appears that no announcement has been made of development plans for any of the rest of the land, giving rise to fears that it may remain once again unused, or be exploited in environmentally destructive projects. The government has not explained this departure from the usual practice under the Aliens Landholding Ordinance.

The BEC lands have a complex pattern of soil types and drainage patterns, leading a recent study to conclude it unsuitable for large monocrop agribusiness, but ideal for agroforestry development,⁵⁹ while a 1954 survey indicated as a major development constraint 'ownership by a company not ready to sell the land in small lots.'⁶⁰

Bowen is reported to be negotiating with the Hershey Corporation with a view to establishing cacao; he has also expressed interest in continuing exploitation of mahogany, and in developing the tourist potential of the area's Maya ruins. An unsuccessful bidder for the land had intended a wildlife reserve and tourist complex with citrus and cacao at the perimeter. Bowen still maintains enthusiasm about the power-station project, but this is unlikely to be any better received than before.⁶¹ (When asked for his view of wood-burning as an energy source

in an interview for the government magazine *New Belize* the Minister of Natural Resources ducked the issue, claiming that he understood that 'only a limb or two from those trees would be used.'⁶²

Cattle farming for low-grade hamburger beef, is a strong possibility. This most destructive use of shallow forest soils may have consumed one-third of Central America's forests over the last thirty years. 'Of all tropical countries, Belize may have the least depleted soil resources.'⁶³ To the north-east and south of the BEC lands Mennonites (an immigrant community of fundamentalist Christians from North America) use cleared forest to support the country's commercial dairy industry. Livestock has been expected to expand for some years; the Belize Meats Ltd abattoir, owned 51 per cent by the government and 49 per cent by the US Contris Bros corporation, operates at 20 per cent capacity and received US Department of Agriculture certification (for export) in April 1985. A month later, the government suppressed a profitable export trade in live cattle to the French Caribbean.⁶⁴

Politically, the question is the extent of the influence the economic power of the Houston investors has enabled them to win over the government. Bowen's link with Coca Cola is longstanding, since he has held the Belize bottling franchise since 1960. After a courtesy visit to the opening of the Grenada parliament, Prime Minister Esquivel's first foreign trip was to Houston at the invitation of its Chamber of Commerce.⁶⁵ Of the other investors, both Houston-based, Paul Howell's oil company has interests in promising test wells in the north of Belize,⁶⁶ and sponsored an unsuccessful scheme to save the Libertad factory by buying molasses from BSI for conversion into ethanol. Howard Mischer, a prominent Republican property developer and banker, joined the board of Howell Petroleum in 1983. Both men are reported to be linked in an enterprise named Belco (surely an acronym for Belize Company) with Keith Jackson, another Houston businessman who owns Maya Mariculture, a US\$10 m shrimp hatchery project which represents the best prospect for expanding marine products revenue. Williamson Industries is based in Fort Worth, Texas, while a number of Houston investors are involved in hotel construction on the fast expanding tourist resort Ambergris Caye. Coca Cola Foods, the parent of Minute Maid, is itself based in Houston.

Conclusion

The export economy of Belize is becoming increasingly dependent on the US market. In addition, all sectors of growth or potential growth are US-controlled; all save cacao, and including the largest tract of private owned land, are under the control of a small group of Texas-based businesses.⁶⁷ The domestic factors contributing to the hegemony of the new metropolitan elite are the rapid collapse of the crop of dependent sugar between 1980 and 1985, and long-term structural problems

⁶⁷ *Belize Briefing*, October and December 1985; *Insight*, November 1985.

agricultural underdevelopment, balance of trade deficit and underemployment. The dangers to the country of too open an attitude towards foreign investment are illustrated by reports that another Houston businessman, the major partner in a scheme to establish a detergents industry, was wanted in his home state on fifteen fraud charges.⁶⁸ There are indications that the new UDP government, as it gains the political experience denied it by the 30-year monopoly of power by the PUP, is becoming more wary of dependence on the US. Proud of its record in combatting the marijuana traffic, it was profoundly angered by US pressure to resume aerial spraying, a sentiment expressed in a powerful speech by the Minister of Foreign Affairs to the UN General Assembly in October 1985.⁶⁹ In January 1986, the 'Gone Abroad' columnist of the UDP newspaper complained of the 'surprising arrogance' of USAID, warning their Belize representative of 'the anti-American sentiment which is already in danger of mushrooming in Belize.'⁷⁰ In its 10-point 'Highlights of the UDP Year in Review' the paper did not include the Coca Cola land deal, although it had previously described it as 'the most significant foreign investment made in Belize.'⁷¹ It is to be hoped that Belize, after a history of dependence on logwood, mahogany and sugar controlled from London, may yet escape dependence on citrus controlled from Houston. For the government itself it is a political conundrum: the citrus groves planted now should just be reaching production in time for the next General Election in 1989.

Aquino's elite populism: initial reflections

The passing of the old order in the Philippines yielded dramatic scenes reminiscent of 1789 in France and 1917 in Russia.

But did the accession of the Aquino government have the same significance for the people of the Philippines as the two European revolutions had for the French and Russians? Despite the unrestrained use of the word 'revolution' by Aquino partisans, what took place in those glorious February days was not a revolution but essentially a transfer of power from one faction of the Philippine elite to another. The dictator may have fled and liberalisation may be the order of the day but, as in Raul Alfonsín's Argentina, the old social structure is still in place.

An elite government, but a complex one

And yet this government does not simply represent a return to the formal democratic system that preceded the imposition of the Marcos dictatorship in 1972. Emerging after fourteen years of harsh repression, the government has a very strong anti-fascist strain. And inheriting a treasury debauched by the kleptocratic practices of Marcos and his cronies, Cory Aquino and her closest associates have launched a moral crusade against the old corrupt and extravagant ways of the Filipino ruling elite.

Cory Aquino herself is the embodiment of these strains and just how strong they are was manifested in two of her first acts in office: she ordered the release of all political prisoners, including top leaders of the left, over the objections of the military and she decreed that Malacanang, the presidential palace, be converted into a 'Museum of Decadence'. There is in this a spirit something akin to revolutionary puritanism, and it is one of the sources of Aquino's immense popularity.

Another feature of this government that dilutes its ruling-class character is its dependence on massive popular mobilisation or 'people's power'. It came to power, not through elections, but through extra-parliamentary means on the back of a military but largely spontaneous people's movement. Elite interest groups surround Aquino, but she

herself is situated not by a political machine but by this direct charismatic relationship to the masses. 'I will not allow myself to be stopped,' she has declared, 'The people are on my side and I can still draw large crowds in the squares.'¹

Keeping this relationship alive and strong will entail enacting policies which are likely to step on the toes of the conservative elite forces. As many of her elite backers have already discovered, 'revolutionary legitimacy' is a double-edged sword.

A third critical feature of the Aquino administration which offsets the dominance of ruling-class interests to some degree is its ambivalence toward the US. Success has many parents, and among those now claiming paternity of the new government is the US.

This claim is dubious: President Reagan did not desert Marcos until after the Filipino dictator had already been defeated by a people's uprising and a military mutiny. Nevertheless, many Washington officials, especially at the State Department, are congratulating themselves for having pushed Marcos to liberalise and to hold elections, which resulted in his losing control. Some see in the Philippine developments a successful implementation of the 'Doctrine of the Third Force' which has allegedly replaced the 'Kirkpatrick Doctrine', which stood for firmly backing authoritarian allies like Marcos. According to Charles Krauthammer, one of the doctrine's most ideologically strident proponents, the Third Force concept is simple. 'In friendly countries ruled by dictators, America should use its influence to support a "Third Force", a democratic alternative to a pro-American despot on the one hand and communist insurgencies on the other. A Third Force strategy means not settling for the lesser of two evils, but trying to help build and support a middle, democratic way.'²

Cory Aquino's movement is seen as such a Third Force. But whether it will accept or effectively play the role Washington wants it to assume is open to question. Though they were definitely receiving encouragement from the US Embassy and State Department officials prior to the elections,³ Aquino's forces were receiving other signals

¹ 'Aquino interviewed on commitment to change,' *La Repubblica* (Rome), 11 March 1986, p. 3. Reproduced in Foreign Broadcast and Information Service, *Daily Report Asia and Pacific*, 13 March 1986.

² Charles Krauthammer, 'Bringing a third force to bear', *Time*, 10 March 1986, p. 84

³ Shortly after Marcos announced the snap presidential elections, the US Embassy *charge d'affaires*, Philip Kaplan, gathered key opposition leaders, including José Cojuangco, Cory Aquino's brother, and Butz Aquino, her brother-in-law, for a breakfast meeting with Richard Holbrooke, former Assistant Secretary of State for East Asia and Pacific Affairs. Those present were urged

from the White House. Reagan's notorious claim that there was 'fraud on both sides' and his hanging on to his old ally, Marcos, until the end, angered Aquino, who already resented the shabby treatment that Washington had accorded to her husband when they were in exile in the US in the early 1980s. Aquino and many other members of her cabinet may not be leftists but they have been victims of Washington's opportunistic diplomacy and it is something of which they are very wary.

While the US continues to exercise significant influence over key elements within the new government (such as Vice-President Salvador Laurel and Defence Minister, Juan Ponce Enrile) that influence is not as dominant as it was under Marcos.

An unstable coalition of elite factions

The US nevertheless has a lot of room to manoeuvre, since a prime characteristic of the new government is its being an unstable coalition of sharply competing elite factions or tendencies. Dominant among these are the elite reformists, many of whom were disenfranchised under Marcos by his imposition of martial law in 1972. While favouring the restoration of formal democracy, the elite reformists retain a strong interest in maintaining the country's landlord-dominated semi-feudal agrarian structure and keeping the economy structurally tied to the US. Aquino is, by blood and marriage, linked to two of the most prominent landlord families in Central Luzon, while Salvador Laurel is the chieftain of the most powerful landlord political dynasty in Southern Luzon.

Aquino's conservative instincts are manifest in her views on land reform, the principal social issue confronting her government. 'It is not so much a matter of distributing land,' she recently said, 'but of enabling people to share profits. By sharing out the land, you only create more problems because sugar cultivation, for instance, is definitely uneconomic if carried out in small plots.'⁴ The desire not to disturb the economic status quo is also reflected in her choice of two staunchly pro-Western businessmen, Jimmy Ongpin and Jose Concepcion Jr, as

by the Americans to field one presidential candidate and were advised not to press for the legalisation of the Communist Party or to raise the issue of the US bases since this 'would not play well in the US' Confidential cable from US Embassy Manila, to Secretary of State, 6 November 1985.

⁴ 'Aquino interviewed . . .', *op. cit.*

her chief economic lieutenants. A devout Catholic, she pays special attention to the extremely influential Cardinal Jaime Sin and to a coterie of Jesuit priests noted for their strong anti-communist sympathies who are actively searching for ways to outmanoeuvre the left in gaining popular backing for conservative social reform.

Next in terms of influence within the governing coalition is the militarist faction headed by the Defence Minister, Juan Ponce Enrile, and the Armed Forces Chief of Staff, Fidel Ramos, who defected from Marcos. After fissioning into 'loyalists' and 'rebels' during the four-day February uprising, the Armed Forces of the Philippines have fused together again. 'Over-staying generals'—most of them pro-Marcos—have been retired in the military's effort to gain a new image as the 'New Armed Forces of the People', as General Ramos put it. Yet, it is the same old army, with scores of officers and military units from top to bottom implicated in the fourteen-year repressive rule of Marcos. Enrile was instrumental in planning the imposition of martial law in 1972, and he has allegedly enriched himself by pillaging the treasury just as other Marcos cronies have before he was marginalised from the regime's inner circle when his presidential ambitions clashed with those of Imelda Marcos. As head of the national police, the Philippine Constabulary, General Ramos presided over that branch of the armed services which compiled the worst record of human rights abuses during the Marcos period. Many leaders of the 'Reform the Armed Forces Movement' are field commanders who initiated counter-insurgency campaigns which took a high toll of innocent civilian lives.

Aside from serving as a vehicle for Enrile's overweening ambitions, the overriding goals of the militarist faction are to pursue the counter-insurgency drive against the leftist New People's Army, to retain the military's influence in politics and to protect it from being subject to judicial prosecution *à la* Argentina. But most important, being solidly pro-US, the militarists serve as the key conduit of US influence into the governing coalition.

A potential source of support for the Enrile-Ramos group is the old Marcos political machine, which is currently in disarray. This mixed bag of local warlords, regional strongmen, and technocrats, however, is not likely to disappear. Yet Enrile's wooing of his former comrades is likely to be disputed by Laurel, a skilled political operator who himself was part of the Marcos bloc until 1980.

Perhaps the weakest grouping within the administration is that formed by elite or middle-class nationalists—classified as 'liberal

democrats', or LDs, by the left. The liberal democrats are not only strongly anti-fascist, but they also espouse nationalist policies aimed at sharply reducing US political and military influence. Among these individuals are former Senator Jovito Salonga, head of the Commission on Good Government, an elite politician who evolved into a strong nationalist after the imposition of martial law; former Senator Jose Diokno, chairman of the Human Rights Commission, who is one of the most uncompromising critics of US bases and transnational corporations in the Philippines; and the Minister of Labour, Augusto Sanchez, noted not only for his nationalist credentials but also for his anti-capitalist views.

There are other appointees, who are considered even more radical, such as the Minister of Social Services, Mita Pardo de Tavera, and the Human Rights Commissioner, Sister Mariani Dimaranan, head of the prestigious Task Force for Detainees. It is with this grouping of liberal democrats and progressives that the US is most uncomfortable, for most of them are not known for putting expediency ahead of political principles. They are not an immediate threat, however, for though they are in highly visible positions, they are eclipsed in numbers and influence by the traditional elite reformists and the militarists. Their presence, nonetheless, lends the government an image of being progressive.

The composition of the ruling coalition is a response not only to the profound anti-dictatorial sentiment of the population, but also to the fact that the centre of gravity of mass political opinion has moved left in the last two decades, towards nationalism and egalitarianism. In a very real sense, there cannot be a return to the conservative elite democratic system that existed prior to 21 September 1972. The long Marcos rule created a deep-seated popular revulsion against elite exploitation, arbitrariness, extravagance, corruption, patronage, and warlordism—all of which were ruling-class political practices during the parliamentary republic which Marcos and his gang merely appropriated and developed to a cosmic scale. Likewise, the steady US backing for Marcos contributed immeasurably to the weakening of the 'colonial mentality' and the spread of a mass nationalism which was hardly appeased by President Reagan's last-minute ditching of Marcos.

The current coalition government represents a very messy method by which the elite reconstruct its hegemony among the Filipino masses, but given the heightened state of political mobilisation, which cuts across all classes, it has few other options.

Destabilising conflicts

The conflicts *within* and *among* the factions and tendencies making up the governing coalition are likely to be destabilising, especially as the overwhelming tasks of political and economic reconstruction get under way. Already, the traditional conflict over the spoils of political office has emerged among the elite reformists. Aquino supporters, Laurel's UNIDO Party and the PDP-Laban Party of the populist politician, Nene Pimentel, are currently locked in struggles not only over cabinet appointments but also over the apportionment of provincial and municipal posts. With cases of two or three appointments to the same public office coming to light, many Filipinos are beginning to wonder if the new government can, in fact, escape being smothered by the 'spoils system' that sapped the legitimacy of the pre-martial law republic and destroyed the dictatorship.

The tensions between the elite reformists and liberal democrats, on the one hand, and the militarists, on the other, will intensify. The first few weeks of Aquino's rule were marked by sharp, though muted, conflicts with the military over the release of leftist political prisoners and over the government's strategy toward the insurgency. Aquino's staging of a two-million strong demonstration a few days after the military had protested about her release of the alleged Communist Party founder, Jose Maria Sison, and other leftists was meant partly to show who was boss. After Enrile warned that the Armed Forces Reform Movement would 'have a say' if Aquino were to replace him, she responded by forming a Human Rights Commission whose members vowed to investigate and prosecute all 'official terrorists' all the way to the top of the military hierarchy. And against Enrile's and Ramos' strong preference for a mailed-fist approach toward the insurgency, Aquino unveiled a counter-insurgency programme which placed the emphasis on 'reconciliation' and reformist co-optation. The alliance between Enrile and Aquino is indeed a very fragile one, and it is unlikely to survive a determined effort by Aquino to bring human rights abusers to justice and to drive the military back to the barracks.

Aquino's group and the militarists, however, are likely to find themselves on the same side, struggling against the nationalists and liberal democrats when it comes to policies toward the US and US capital. The Human Rights Commission Chairman, Jose Diokno, has already raised once more the nationalists' demand that the bases be withdrawn soon. While Finance Minister Ongpin has laid out a

programme promising free enterprise and welcoming foreign capital, the Labour Minister, Augusto Sanchez, has called for tough restrictions on multinational firms and stronger measures to protect labour from 'dirty capitalists'. The nationalists are also already making life hard for the reformist elite and pro-Western technocrats on two issues: the International Monetary Fund austerity programme, which they want ended immediately and the \$26 billion foreign debt, a large part of which they want to repudiate outright.

The economic time-bomb

The instability and conflicts within the governing coalition will be exacerbated by a number of developments, but principal among these is the conjunction of a deepening economic crisis with heightened expectations of economic relief. Over the last two years, the GNP has fallen by 10 per cent. However, there is no relief in sight, for the crisis of the Philippine economy is not simply due to plunder by Marcos and his cronies. Nor is it merely a conjunctural problem associated with the international recession. It is a structural crisis associated with the economy's colonial, export-oriented character at a time of global recession, reduced demand for its traditional agricultural exports, and rising protectionism in the West against its newer, labour-intensive manufactured exports such as garments. The lack of a dynamic industrial sector based on an expanding internal market has meant the absence of a countervailing mechanism against the depression of the export sector. Thus, even without a Marcos plundering the Treasury and even if the international banks were to grant some relief from the onerous payments for the country's \$26 billion debt, it is unlikely that the economy will stop contracting in the next few years.

Aquino's strategy so far has been to buy time by exposing the full extent of Marcos' pillaging of the economy, kindling some hope in recovering the wealth kept in overseas banks and US real estate and calling for sacrifice in the months ahead.

The limits of such a strategy, however, are likely to be reached very soon, especially with people who have experienced nothing but the erosion of their living standards for the last fourteen years. At a time of great concern over the US budget deficits, it is unlikely that massive amounts of aid can come from Washington, although the international banks might temporarily ease their debt repayment terms and the IMF might relax its austerity programme.

That the popular radicalisation spawned by the economic disaster would continue after Marcos' departure had, in fact, been foreseen by Aquino's slain husband, and his words contain a grim warning for her:⁵ Look, you have a situation when Marcos falls, you come in, the Communists back off, and people expect you to make miracles. How do I put back three million jobs? How do I bring down the price of gasoline, for Pete's sake . . . So the people will say, 'Jesus Christ, you're the guy we waited eight years for? You're even worse! . . .' The thing I can say is, the first guy that will come in will be blown out in six months. Then a second guy will come in and he'll be blown out in six months.

Aquino and the Left

The future of the Aquino Administration will be greatly dependent on her relations with the Left. Has Aquino decisively outmanoeuvred the Left and marginalised it, as some analysts have claimed? Or is Aquino's glorious February Uprising merely a prelude to a Red October?

The conventional view propagated by the *Wall Street Journal* and the *New York Times* is that the Left was a big loser in the recent events since it lost its 'best recruiter', Marcos. Moreover, by choosing to boycott the 7 February elections, the Left—represented by groups such as Bavan, the largest popular opposition grouping, the Nationalist Alliance, and the outlawed National Democratic Front—is said to have lost the opportunity to gain a position of significant influence within the new administration.

Aquino's forces did not need the Left to win and her key advisers knew this right from the beginning. Moreover, explicit support from the Left, they feared, would play right into Marcos' hands by allowing him to paint Aquino as the 'candidate of the NPA', which he tried to do nonetheless, unsuccessfully. But most important, the Aquino forces were conscious that they were not only fighting to oust Marcos but also trying hard to outmanoeuvre the Left and prevent a real revolutionary solution to the Philippine crisis.

The Cory Aquino movement is a genuine populist phenomenon, but its leadership is provided by the elite and its main base is the urban middle class. It is the latest manifestation of the political mobilisation of

⁵ 'The Philippines: the more things change, the more they remain the same, an interview with Benigno Aquino', *Multinational Monitor*, February 1981, p 17.

the middle class which was sparked by the Aquino assassination in August 1983. This spontaneous movement absorbed the ineffectual elite opposition, then challenged the leading role of the mass-based, cause-oriented opposition which the National Democratic Front had helped to forge in the previous decade. The middle-class movement and the Left opposition coexisted uneasily until the National Assembly elections of May 1984, when the middle class threw its weight behind candidates of the elite opposition while the Left-led 'cause-oriented' opposition boycotted the polls.

It was not, however, until Cory Aquino's candidacy that the various elite and middle-class political factions pulled together, with Cardinal Jaime Sin of Manila and the Catholic Church hierarchy playing a decisive role in the process. Cory's ability to combine the image of suffering widow with that of a determined, courageous Joan of Arc image succeeded in bringing out on to the streets millions of the unorganised working masses—the great mass of struggling lower middle-class clerks, small stall-owners and vendors, small transport operators, unorganised workers and the vast number of residents of the cities' ever-expanding shanty towns. The organised forces of the Left within the lower classes could not match this spontaneous, populist wave, and, in fact, Bayan and the other organisations did not wage an active boycott campaign.

Aquino's populist success shows how far the Left has to go in its organising work among the urban masses. Ironically, however, it is success built on appropriating the tactics of the Left—pushing the limits of legality through militant confrontations and shaking the foundations of the regime through the extra-parliamentary mobilisation of the people. Indeed, Aquino's successful seizure of power would not have been possible without the groundwork that had been laid in the previous fourteen years by the Left's uncompromising opposition to Marcos, and without the 'space' for open opposition in the cities that had been created by the countless demonstrations staged by the Left in the 1970s which the regime had unsuccessfully tried to repress with violence.

The common goal of overthrowing the Marcos order, however, has so far overshadowed the competitive dimension in the relationship between Aquino and the Left. In a number of conciliatory statements, the National Democratic Front (NDF) has recognised Aquino as president, pledged support for 'positive measures' like the release of political prisoners, and urged her to make moves toward land reform and greater independence from the US. Indeed, the Left assesses

Aquino's ascendancy as a 'crack in US imperialism's hold on the Philippines.'⁶

Aquino, for her part, has initiated a policy of 'reconciliation' with the Left, aimed at integrating it into the 'democratic mainstream'. The release of all political prisoners, including the top leaders of the Left (including the alleged founder of the Communist Party, Jose Maria Sison) and the naming of nationalists and some progressives close to the mass movement to cabinet positions are gestures in this direction.

Competition, however, is not far from the surface. Like her slain husband, Aquino and her closest advisers see bringing the Left into the parliamentary process as a way of taming it, confident that, as in Europe and Japan, the revolutionary Left would remain a minority if it enters the bourgeois democratic arena. The Left, for its part, views the 'democratic space' created by the new regime as providing an opportunity for it to experiment with new tactics and new forms of organisation to win over the unorganised masses and 'middle forces' which have been activated by the Aquino candidacy and the February uprising.

In the immediate future, the state of relations between Aquino and the Left will depend greatly on resolving the status of the New People's Army (NPA), the main armed wing of the NDF. Aquino has offered a cease-fire and an amnesty for insurgents who lay down their arms, coupling this with a warning that 'those who do not [heed the call to reconcile] will face a reformed and reinvigorated fighting force dedicated to the protection of democracy and the honour of our country'. In response, the NDF and the general staff of the NPA have stated that '[with] just, sincere, and prudent moves of the concerned parties, a negotiated ceasefire [is] possible on a nationwide scale.' They add, however, that 'objective conditions at the present time do not permit the surrender of the people's right to bear arms in the defence of their revolutionary gains in the past 17 years'.

Just negotiating a ceasefire will be hazardous, for the Left will demand measures to guarantee its safety, including the dismantling of military units guilty of human rights abuses, meting out justice to military men implicated in such abuses, and the withdrawal of military units from large areas of the countryside under NPA control. Cory Aquino might just be receptive to these conditions, but it is unlikely that Enrile and the military will agree to them. Indeed, even as Aquino

⁶ National Democratic Front International Office, 'Statement on the new government', 27 February 1986.

announced the policy of reconciliation, the military was carrying out search and destroy missions in various parts of the country and redeploying several battalions from the cities to areas of the country marked by high levels of insurgency.

For the Left, in fact, the main threat does not come from Aquino's policy of co-optation but from the militarist faction of the government, which it sees as waiting in the wings, waiting to reassert its dominance at the appropriate time, with backing from the US government, whose main interest continues to be the eradication of the Left through a military solution. One NDF document describes the government as highly unstable and sketches what it sees as the likely scenario in the next few months or years:⁷

The instability and conflicts in the governing coalition will be exacerbated by the continuing economic crisis, the growing popularity of demands for fundamental solutions to the Philippines' basic problems, and the advance of the national democratic movement. The new regime has raised expectations of swift, widespread, and thorough political and economic changes which it cannot possibly fulfill, given its essential character as a government of the ruling class. In the face of mounting dissatisfaction . . . the government will find it increasingly difficult to maintain a policy of trying to coopt the revolutionary movement. This will make the US prescription of a vastly stepped-up counter-insurgency program more attractive to the government. The US has, in fact, made it quite clear that its continued support for the Aquino government is contingent on its capacity to implement a more effective counter-insurgency effort than that which took place under the Marcos regime.

These measures will inevitably translate into a consolidation of the fascist machinery, a resurgence of the military's influence in politics, the blunting of democratic reforms, even more intense splits within the ruling coalition—all of which could result in the ascendancy of the fascist faction.

A prolonged political honeymoon between Cory Aquino and the Left would, despite their differences, go a long way toward moving the country toward a more progressive political order. The US and the Philippine military, however, will never allow a *modus vivendi*, while the elite political parties seem determined to bring back the old politics of patronage. To complete her already limited programme of democratic reform, Cory Aquino will have to break with the US and with the elite. She has, indeed, consistently and pleasantly surprised the country with her progressive moves. But there are limits to elite populism.

North-South Monitor

UN SYSTEM

International Fund for Agricultural Development (IFAD)

Governing Council: Ninth Annual Session

Time, 21-24 January 1986

After eight rounds of consultations, lasting a period of two and a half years, an agreement was reached among donor countries on the second budget replenishment of IFAD II. The agreement, reached when negotiations resumed in Rome in January 1986, was endorsed by the 141-member Governing Council.

The negotiations, which began in June 1983, had been prolonged by a dispute between members of the Organisation of Petroleum Exporting Countries (OPEC) and the Organisation for Economic Cooperation and Development (OECD), chiefly over their relative budget contributions. IFAD, which targets concessional loans to poor farmers in developing countries, was founded on a partnership of OPEC and OECD countries, which had resulted in their funding IFAD in a ratio of OPEC to OECD contributions. OPEC members' efforts to reduce their contributions owing to falling oil revenues had, however, met with opposition from the US, which insisted on retaining the original ratio.

An agreement was reached on IFAD II after the US lowered its objections to a reduction in OPEC's proportionate contribution from 42 per cent to 40 per cent. The level of funding agreed upon was, however, much lower than had been sought. A replenishment of \$500m over the three years 1985-7 was agreed upon, constituting a 10 per cent budget drop from previous funding levels, amplified by taking inflation into account. (The original fund agreed in 1977 had been \$1bn and IFAD I, agreed in 1980, had been \$1.1bn, with 56 per cent from the OECD, 41 per cent from OPEC and 3 per cent from non-oil exporting developing countries.) At the time of the Council meeting, only \$460m had actually been pledged by donors (\$276m from OECD countries and \$184m from OPEC countries). Since a further \$24m was to come from non-OPEC developing countries, OPEC and OECD members agreed to make up the remaining \$16m by 19 February 1986, on the basis of a 2:3 ratio. The disappointing level of the replenishment was partly offset by the Council's approval of a separate budget of \$300m for IFAD's Special Programme for arid and semi-arid African countries affected by drought and desertification. The programme, focusing on small-scale agricultural and irrigation projects in the arid zone, was a departure from IFAD's usual funding arrangements, in that it was financed mainly by OECD countries. The total amount pledged at the time of the meeting was \$200m.

In view of the difficulties experienced in securing IFAD II, IFAD's President, Georges Izzi, established a committee of experts to study ways of financing IFAD in the future, without abandoning its 'special character' and governing structure, which gave equal voting power to the three groups of countries (twenty OECD, twelve OPEC and 109 other developing countries.) The committee was to begin work in February 1986 and to prepare a report for the next meetings of the IFAD Executive Board and the Governing Council. The decision was also taken, at the suggestion of Idriss Mahdoui, to reduce IFAD's already low operating costs by 8 per cent.¹

North-South Monitor

● 'We had to wait nearly two years to achieve a consensus among the members of the Fund on the Second Replenishment of IFAD's resources and another eleven months to evolve from consensus to unanimity . . . In the end, members have come forward with the necessary flexibility and determination to secure the future of the Fund at least for the time being. We must now translate this confidence and resolve of the member-countries into the efficient utilisation of the resources at our disposal and into charting a more permanent basis for the future operations of the Fund.' Idriss Jazairy, President of IFAD, following the securing of IFAD II. *UN Press Release IFAD/287*, 24 January 1986.

'We felt we needed to have a lifestyle appropriate to an organisation whose role is to deal with poverty.' Idriss Jazairy, commenting on IFAD's decision to cut its operating costs. *Financial Times* (London) 29 January 1986.

▲ Commission on Transnational Corporations (TNCs)
Reconvened Special Session
New York, 20-31 January 1986

■ The special session of the Commission was reconvened to discuss the draft code of conduct on TNCs, most of which had been approved at previous meetings, but which remained the subject of residual disagreements.² An extensive exchange of views on the outstanding issues in the draft code was reported to have clarified the opposing positions involved, but to have proved inconclusive. It was decided that a one-day resumption of the session would be convened, after further informal consultations.³

▲ UN Conference on Conditions for the Registration of Ships
Fourth Session
Geneva, 20 January-7 February 1986

■ After four sessions of the conference, conducted under UNCTAD's auspices since July 1984, the hundred participating countries adopted a convention on conditions for the registration of ships. The twenty-one article treaty, aimed at curbing some of the worst abuses associated with open registries or 'flags of convenience', is the first international legal instrument which identifies the components of the 'genuine link' supposed to exist between a ship and the flag it flies.

The three main economic conditions for the registration of ships, concerning ownership, management and manning, had largely been agreed upon at the third session of the conference, in July 1985.⁴ Yet to be decided had been their legal status. The fourth session determined that of the three central articles in the treaty, that on management should be mandatory, while states should have to satisfy either the conditions on ownership or those on manning, or both. The Chairman of the conference, and Merchant Marine Minister of the Ivory Coast, Lamine Fadika, explained that the choice was to take account of different conditions prevailing in flag states. Some might lack sufficient manpower among their nationals or residents to create a genuine link through satisfying the manning requirements, while others

North-South Monitor

might lack sufficient capital to participate through ownership. Flag states were, however, required to ensure that the crews of their ships were sufficiently competent to guarantee the application of international standards of safety. The terms and conditions of employment were also to be checked for conformity with international standards, by the state of registration. Labour-supplying countries, which include the Philippines and South Korea, were also expressly encouraged to conclude bilateral agreements with flag states to protect their nationals.

The mandatory article on management in effect makes the flag state responsible for ensuring that those accountable for managing the ships they register are also capable of discharging any financial obligations they may incur through damages. Another key article in the convention provides for the establishment of 'national maritime administrations' in flag states, to check for compliance with international regulations, particularly those on safety and marine pollution. A further provision obliges flag states to ensure that their ships are adequately identifiable, and therefore fully accountable, particularly for the purpose of identifying and punishing maritime fraud.

The convention fell short of the aspirations of some developing countries, which had argued that flags of convenience were preventing them from expanding their own merchant shipping fleets, by allowing Western companies to recruit low-wage foreign crews. It was thought that the open registry system was unlikely to disappear as a result of the convention, which would in any case not enter into force until it had been ratified by forty states, accounting for at least 25 per cent of the world's gross tonnage. Lamine Fadika expressed the hope, however, that the treaty would become operational within five years, but predicted that its effects would be gradual and progressive.⁵

INTERNATIONAL MONETARY FUND/WORLD BANK

▲ International Development Association (IDA)

Meeting of Donor Countries

Paris, 27-28 January 1986

■ The thirty-four donor countries to the IDA met for their first round of negotiations for its eighth replenishment (IDA VIII).⁶ IDA, the soft loan affiliate of the World Bank, provides long-term, virtually interest-free loans to the poorest countries, with per capita incomes of below \$790 per annum.

According to Moeen Qureshi, the IDA Senior Vice-President chairing the negotiations, the donor country representatives had fixed a negotiating range of between \$10.5bn and \$12.5bn. They appeared, however, to have determined a \$12bn target for the three years beginning in July 1987, when IDA VII runs out. Such a sum would constitute the same in real terms as IDA VII plus the Special Fund for Africa (the special fund provides \$1.3bn for sub-Saharan Africa by fifteen industrialised countries who were disturbed by the low figure of \$9bn insisted upon by the US for IDA VII in January 1984). The proposed \$12bn would, however, be substantially less in real terms than IDA VI, which ran from 1981-4.

The Chairman of the negotiations also reported the tentative response of the donor

North-South Monitor

countries to US proposals for changing the terms of IDA loans. They accepted the suggestion to reduce the maturity of loans from fifty to forty years, provided that the replenishment was large enough. They were generally favourable to using some of IDA's resources in association with the IMF Trust Fund. They considered the possibility of reviewing specific loans after a twenty-year period, to assess any improvements in a country's financial position, but were not prepared to countenance higher interest rates on the loans, as the US was advocating. Though the representatives agreed that IDA's priority should be aid to sub-Saharan Africa, they were in favour of maintaining the current nominal levels of concessional flows to India and China. Both these countries were eligible for IDA funds, but were threatened by US efforts to secure changes in the distribution of loans.

Further meetings of donor countries were scheduled for April and June 1986, to prepare for the completion of the replenishment negotiations by the time of the annual IMF and World Bank meetings in September 1986.⁷

COMMODITIES

▲ UNCTAD Committee on Commodities

Eleventh Regular Session

Geneva, 2-13 December 1985

■ Some one hundred participants on the committee concluded their regular session with agreement on three substantive issues: the role of International Commodity Agreements (ICAs); international action on commodities not covered by ICAs; and the participation of developing countries in the processing, marketing and distribution (PMD) of the commodities they export.

The committee had begun to assess the role of ICAs, negotiated under the Integrated Programme for Commodities (IPC), at a special session in June 1985.⁸ No consensus had been reached then, but draft texts had been submitted by the Group of 77 (G77) and the industrialised countries respectively, which were considered by the committee in December 1985. The ICAs examined were the eight negotiated or renegotiated under UNCTAD's auspices: cocoa, jute, natural rubber, olive oil, sugar, tin, tropical timber and wheat. (The ICA on coffee was concluded within the UN, but renegotiated outside UNCTAD.) The conclusions adopted could be seen as a renewed commitment to ICAs as a fundamental component of the IPC, despite the pessimistic forecasts for commodity agreements due to the collapse of primary commodity prices since 1980, and specifically to the 'tin crisis'. As a result of the failings of certain agreements, a number of recommendations were made for the success of ICAs:

- Price stabilisation measures, either buffer stocks, export quotas or other supply management measures, applied singly or in combination, should be capable of defending 'floor' and 'ceiling' prices with equal effectiveness.
- There must be adequate financial resources to ensure that a buffer stock operates effectively.

North-South Monitor

- Supply management measures should be supported by the vast majority of important producing and consuming countries.
- Agreed price levels should be 'market-related and compatible with dynamic market conditions'. There should also be price adjustment mechanisms (where possible automatic or semi-automatic) to take account of market conditions. Price ranges structured to include discretionary zones, to defend floor and ceiling prices more effectively are recommended.
- The ICA should have the participation and support of as many producer and consumer countries as possible, and they should strictly observe the balance of rights and obligations under the agreement.
- Producers and consumers should make use of industry advisers in approaching the negotiations.
- The potential importance of the Common Fund for Commodities for the IPC was noted, and committee members urged to ratify the agreement establishing it.⁹

The eleven IPC commodities not covered by ICAs (six agricultural: bananas, cotton, hard fibres, vegetable oils, tea and meat; and five mineral or metal: bauxite, copper, iron ore, manganese and phosphates) were the subject of a report by the UNCTAD Secretariat.¹⁰ Intergovernmental work on these commodities was said to be at a virtual standstill. On the basis of the report's suggestions, and of a G77 proposal, a resolution was adopted by the committee. Ad hoc intergovernmental meetings on non-ICA commodities under the IPC, and on hides and skins (over which the committee had previously expressed concern) would be held if prior consultations between the UNCTAD Secretary-General and principal and interested producer and consumer countries registered a 'perceived need' for them, a need confirmed by UNCTAD's Trade and Development Board, after reviewing these consultations at its session in March 1986. These ad hoc meetings would review the problems in the world market for each commodity, and the present state of intergovernmental work on it, before recommending some form of international cooperative action, prior to the UNCTAD VII conference.

The issue of developing country participation in the processing, marketing and distribution (including transportation) of their export commodities had been considered at a special session of the committee in January 1985.¹¹ No common ground had been found between G77 and industrialised countries on frameworks of international cooperation on PMD. At the December meeting, a measure of agreement emerged on the frameworks, though the main body of work on their substantive content remains to be completed. The committee agreed that the frameworks should be mutually acceptable principles for global cooperation, but specific to each commodity sector, and aimed at expanding the processing and exporting of primary commodities in developing countries, and increasing their participation in the marketing and distribution of them. It was also recognised, in deference to the view of the industrialised countries, that the issue of criteria for those frameworks should be given importance. It was not determined whether the mutually acceptable principles referred to would encompass specific measures.¹²

North-South Monitor

▲ Inter-African Coffee Organisation
Ministerial Meeting
Abidjan, Ivory Coast, 11 January 1986

International Coffee Organisation (ICO)
Executive Board Meeting
London, 20-24 January 1986

■ Representatives from eight consumer countries and eight producer countries of the seventy-member International Coffee Agreement (ICA) met to consider two main issues: whether to suspend the ICA's export controls before their automatic suspension in mid-February 1986, in order to reverse the recent dramatic rise in coffee prices; and how much of the ICO's market-control machinery to retain once export quotas were removed.

At the time of the meeting, average coffee prices had risen to over 60¢ above the \$1.20-\$1.40 per pound range which the ICA seeks to defend. The price rise was the result of speculation on the likelihood of a shortage of supply of export-quality coffee, following the drought affecting the 1986 coffee crop of Brazil, normally responsible for one-third of the world's coffee production. It occurred despite the ICO having increased its 1985-6 global export quota by 5m bags, to its maximum of 63m bags.¹³ In response to this rise in prices, President Belisario Betancur of Colombia, the world's second largest coffee producer after Brazil, had launched an initiative to support the ICA and lower prices to within the target range. In a letter at the end of December 1985 to fifteen heads of state of coffee-producing countries in Latin America, Africa and Asia, he called for the immediate suspension of the ICA's export quotas, before their automatic lapse under ICA rules on 19 February 1986.¹⁴ (The ICA determines that quotas should be suspended if the average coffee price remains above \$1.50 per pound for forty-five consecutive market days.)

This initiative was supported by the twenty-five members of the Inter-African Coffee Organisation, of producer countries. At their meeting in Abidjan, the organisation's Chairman, Ivory Coast's Agricultural Minister, Denis Bra Kanon, said that the recent price rise was 'artificial', since there was sufficient coffee to meet demand, and African countries, which account for thirty per cent of the world's production, could easily meet their 1985-6 export quotas of roughly 15.6m bags. While coffee exporters were enjoying the benefits of high prices in the short-term, they were wary of the eventual collapse in prices, bound to follow from reduced consumption and falling demand, as had occurred after the 1975 frost disaster in Brazil. They were also anxious to safeguard the future of the ICA, which represented their long-term security as producers, in the face of increasing disenchantment with the agreement and its failure to defend its price ceiling, among consumer countries. The US in particular had already threatened to withdraw from the ICA, over its failure to secure penalties against exporters' undershipment of their quotas, and the related problem of sales to non-ICO members.¹⁵ In the context of this disaffection with the pact, the producers' move to suspend their ICA quotas and increase exports in order to lower the price of coffee could also be construed as a political gesture towards placating consumer countries.

The position of producer countries at the ICO Board meeting was summarised by their spokesman, Jorio Dauster of Brazil. He said that they were prepared to

North-South Monitor

anticipate the suspension of export quotas, provided that ICO export and import monitoring controls were retained. These controls, such as the provision of certificates of origin, were seen as vital in enabling the ICO to reimpose quotas once the price had fallen, though producers may also have seen them as a means of preventing traders in free ports from entering the market once ICO quotas were removed.

The response of the consumer countries, particularly the US, West Germany and the Netherlands was, however, sceptical. They were apparently against setting a precedent for early suspension of quotas, which could then be applied to their early reimposition when prices fell. No agreement was reached at the meeting to suspend quotas, which were left to lapse automatically on 19 February 1986.¹⁶

The next meetings of the International Coffee Council and Executive Board were scheduled for 21 April–2 May 1986.¹⁷

▲ UN Cocoa Conference 1984

Fourth Part

Geneva, 10 February–4 March 1986

■ Representatives from some seventy cocoa producer and consumer countries made a fourth attempt to negotiate a successor to the International Cocoa Agreement (ICCA). The agreement expires on 30 September 1986, and having been extended twice, the last time in July 1985,¹⁸ its terms preclude its further renewal. Previous negotiations had foundered over disagreements on the two key issues of price levels and price adjustment mechanisms, which continued into the current talks and necessitated their extension beyond the initial deadline of 28 February 1986. The negotiations received their decisive setback, however, when the representative of the Ivory Coast, the world's largest cocoa producer, announced its refusal to join a new agreement.

During the session, the consumer countries presented a proposal for the automatic adjustment of price levels, in line with buffer stock operations and currency fluctuations. There were three parts to their proposal:

- If over a given period the average indicator price remained outside the given price range, and should the International Cocoa Organisation (ICCO) Council be unable to agree on a revision within ten days, a formula would automatically be applied to bring the average price within the required range.
- If buffer stock purchases or sales exceeded a given tonnage over a specified period of time, a Council session would be held. If the Council were unable to determine a price change within five working days, and if the indicator price were outside the given range, prices would automatically be adjusted by a fixed amount.
- A special Council session would be convened if the value of the US dollar (in which the prices in the ICCA are fixed) deviated from a basket of currencies by a given percentage over a given period.

Producer countries put forward alternative proposals. They wished price revisions to be confined to an annual review, and to a movement of US 4¢ per pound in either direction, if the Council was deadlocked after ten days of meetings, if the indicator price was outside the given range, and if 100,000 tons of cocoa had been bought or sold within any six consecutive months since the last annual review.

North-South Monitor

The discussions were effectively halted by the Ivory Coast's decision to remain outside any cocoa pact. The Ivory Coast, representing twenty-six per cent of the world's output, had not joined the last ICCA in 1980, and then as now had objected that an agreement would not ensure long-term price stability. The representative of the EEC, the largest consumer, then suggested aborting efforts to negotiate the economic provisions of a new pact, confining it merely to an administrative agreement. Leading consumers, particularly the 'hardline' British and West German governments, have always insisted on the need for full producer participation in a new pact.

A consensus decision was taken to continue consultations at the ICCO Executive Committee meeting on 2-6 June 1986 in London, to finalise arrangements to replace the ICCA by the end of July at the latest. The conference would be resumed on 7-11 July 1986 in Geneva. Consumer countries appeared to assume that these arrangements would focus on an administrative agreement, the gradual running down of the existing 100,000 ton buffer stock, and the division between producers and consumers of the \$234m in collected levies to the ICCO. Producers, however, attempted to ensure that the wording of the consensus decision did not preclude the future arrangement of an agreement with effective economic provisions.¹⁴

● 'We have reached the moment of truth. We are all subject to the arbitrary decisions of the exchanges in New York, Chicago, London and Paris. Nobody can guarantee us a minimum price,' Denis Bra Kanon, Ivory Coast Minister of Agriculture, disclaiming the power of commodity agreements to protect cocoa producers from speculation on prices. *Financial Times* (London) 27 February 1986.

▲ International Wheat Council

One Hundred and Fourth Special Council Session and Conference
London, 10-13 March and 14 March 1986

■ A new International Wheat Agreement was successfully concluded, to replace the existing one which expires on 30 June 1986. It again comprises two separate elements: the Wheat Trade Convention and the Food Aid Convention.

The new Wheat Trade Convention is designed to reinforce international cooperation between grain exporting and importing countries, and its scope has been widened to include other grains, such as maize and barley. It aims to promote trade in grains and to combat protectionism and discriminatory practices particularly those affecting the interests of developing country members. It also aims to contribute towards world food security and stable markets. It was to come into effect on 1 July 1986, for five years, ending on 30 June 1991. The Council may, however, end it before its expiry date, or extend it for successive two-year periods.

Negotiation for a new Food Aid Convention was completed by the Food Aid Committee on 13 March 1986. Its objective remains the achievement of the World Food Conference target of at least 10m tons of grain per year as food aid to developing countries. The special emergency needs provision, enabling the committee to advocate the supply of increased amounts of food aid to members, was broadened to enable it to respond to food production short-falls in particular regions,

North-South Monitor

such as sub-Saharan Africa or South Asia. The Food Aid Committee acquires increased powers under the agreement, such as those for requesting information on low-income food-deficit developing countries, grain surpluses in developing countries, available for cash purchase, and the possible effects of food aid on grain production and consumption in recipient countries. The agreement was to remain in effect for three years, or be extended by the committee for successive two-year periods, with members' annual contributions subject to review prior to the extension.²⁰

▲ International Tin Council (ITC)
Resumed Special Session
14 January 1986–14 March 1986

Sixteenth Ordinary Session
19–21 March 1986

■ The ITC resumed its series of special sessions which had begun after the suspension of its buffer stock operations on 24 October 1985, and had been adjourned on 20 December 1985, without having found a solution to the 'tin crisis'.²¹ During the recess, however, a new plan was devised in Britain which formed the basis for discussions amongst ITC members and creditors over the next few months.

The new plan, formulated by Peter Graham, Senior Deputy-Chairman of Standard Chartered Bank, and Ralph Kestenbaum, Joint Managing Director of Gerard Metals, in December 1985, was based on the creation of a new company. This company, 'Newco' as it was dubbed, would take over the ITC's assets and liabilities, including tin stocks, and contracts to purchase tin. (The ITC's debts at the time its buffer stock ceased operation were estimated at £350m to banks, and a further £1bn in forward deals to purchase tin from brokers.) The remaining ITC buffer stock of 85,000 tons was then to be sold off gradually, over a period of three years, to prevent a sudden fall in tin prices, hence minimising losses. The company would require funds of £270m, with £200m to come from the ITC's twenty-two member-governments, £50m from brokers and £20m from banks. The plan would absolve ITC members' obligations to the Council, in return for their commitment to share 'Newco's' losses with brokers and banks.

The initial outcome of the ITC's deliberations in informal sessions with creditors and a full Council session, was that the six ITC producers were willing to negotiate with creditors on the basis of the 'Graham-Kestenbaum Plan', while the consumers were divided. The division stemmed from differences between EEC countries, which had been unable throughout the crisis to agree a common position. While Britain was one of the few member-governments to have accepted legal responsibility for the ITC's debts, France, West Germany and the Netherlands refused to accept liability or to give the EEC a mandate to negotiate with creditors. With regard to the new plan, they were seeking a deal whereby the banks and brokers would contribute

North-South Monitor

more, with producers also providing more finance than consumers, and were adamant that the ITC should not have full negotiating powers with creditors. (The voting power in the ITC was divided equally between its six producer and sixteen consumer countries.) During this discussion, a Japanese adaption of the Graham-Kestenbaum Plan was also proposed, whereby 'Newco' would be funded by changing the status of the sixth International Tin Agreement (ITA). Provisional since its inception in 1982, the ITA would be rendered definitive, thereby committing governments (regardless of the question of legal liability) to contributing between £60m and £100m, according to various calculations.

Following a period of intense diplomatic pressure on the dissenting EEC countries (notably by Britain, which feared for the future of the London Metal Exchange (LME) and for London as a financial and commodity centre if the tin crisis was unresolved) the positions of the three countries softened. On 23 January 1986, following a meeting in Brussels, the EEC announced that it had reached unanimous agreement on the principle of holding negotiations with creditors, though it remained divided on the terms of a desired settlement: Britain dissented from the majority view that even £100m was too great a contribution for the ITC to make towards the setting up of 'Newco'. Once the EEC agreement was conveyed to the ITC, the Council announced on 29 January 1986 that it had agreed to start negotiations with creditors.

The first round of talks between ITC representatives and creditors began on 31 January 1986, with the ITC accepting the principle of 'Newco', but unable to agree on its funding. On 5 February 1986, a consensus emerged whereby the ITC would contribute £60m (far less than the £200m suggested in the original plan), with consumers and producers each giving £30m. The next day, Britain announced a conditional offer of a further £25m if the other twenty-one members of the ITC would raise their contribution to £100m, which they then accepted, or a further £50m if they would provide £120m, which they declined to do. Britain had also agreed to give a government guarantee for the first £50m. On 7 February 1986, creditors suggested they might raise their own contribution from £70m to £100m, while pressing the ITC to give £120m, which in turn would trigger Britain's larger offer.

Differences also emerged in the negotiations on legal and technical aspects of the plan. With regard to 'Newco's' strategy for selling the ITC's buffer stock, the creditors favoured selling in regular lots over three years, regardless of price, and while consumers tended to agree, producers favoured more flexibility, with selling over a longer period to keep prices buoyant. While Ralph Kestenbaum had advocated the retention of tin export quotas for the duration of 'Newco', the producers wanted to end the restriction of output to 60 per cent of capacity. Agreement on a legal formula to give 'Newco' and share-holding governments immunity from prosecution also proved elusive. Notwithstanding these differences, on 22 February 1986, a confidential Memorandum of Understanding emerged from the negotiations, in the form of a draft settlement, to be submitted to ITC member governments for approval.

The provisional agreement was understood to have posited a new company, now called 'Tinco', which the negotiators agreed would require £270m in funds, and a further £50m in loan guarantees, with £120m (still disputed within the EEC) coming from the ITC, £50m from Britain and £100m from creditor brokers and banks. Buffer

North-South Monitor

stock sales would take place over three years, at an average price of £6,000 per ton (as compared with the ITA's official price of £8,140 per ton) though, as a concession to producers, 'Tinco' could delay sales if prices were too low.

The ITC initially failed to endorse the Memorandum of Understanding owing mainly to dissatisfaction with the clause on legal immunity from prosecution. On 5 March 1986, however, the EEC countries were persuaded to give their unqualified backing to the deal, making consumer countries unanimous in their support, though they wanted certain minor modifications included. The next day, the Tinco plan collapsed, after the Indonesian representative declared that it was unacceptable. Indonesia objected that the plan could not effectively prevent excess tin from non-ITC producers, such as Brazil and China, from reaching the market and lowering prices, and that its own contribution of £15m was excessive. Of the producers, only Australia, and at the last minute, Malaysia, had backed the plan, while Thailand, India and Nigeria reserved their positions.

Following the failure of the latest rescue plan, the sixteen banks holding 45,000 tons as collateral on loans worth £350m considered themselves free to sell their stocks, whatever the effect on prices. Meanwhile, the LME set a single settlement price of £6,250 per ton for all outstanding contracts to buy from brokers, and debts of £150m were settled by its deadline of 12 March 1986 without defaults. Tin trading remained suspended.²²

The sixteenth ordinary session of the ITC decided not to extend the current export controls beyond their expiry date on 31 March 1986, on the grounds that the fall in the price of tin to £3,600 per ton would itself limit production levels.²³

● 'It is now clear that the ITC's evasive position is being led by the West Germans and the French—both of whom have been aware for at least two years that the ITC was likely to run out of funds with huge debts as a result of the operations the ITC was authorising . . . If a company knowingly traded in this manner it would be a criminal: that European sovereign states should renege on their obligations in this way shows an irresponsibility and cynicism which leads one to believe that it was deliberately allowed to occur in order to damage the reputation and financial strength of the UK's financial and commodity markets.' Ralph Kestenbaum, spokesman for the brokers, and co-author of the 'Newco' Plan, in a statement issued prior to the EEC decision to accept the principle of negotiations with creditors. *The Guardian* (London) 17 January 1986.

'Some consuming member nations are prepared to put up limited amounts of money. But they do not want to give the impression that putting up money could be seen as accepting legal liability for the claims . . . We think those who have the greatest interest in the matter should bear the largest part of the burden.' Onno Ruding, the Dutch Finance Minister, indicating a softening of attitude towards the possibility of a financial deal, but insisting on sovereign immunity for the ITC's member-governments, and, in a suggestion strongly repudiated by Sirman Widiamo, the chief Indonesian delegate to the ITC, asserting that the ITC producers should contribute more than the consumers. *Financial Times* (London) 21 January 1986.

North-South Monitor

DISARMAMENT

▲ Soviet Union–United States

Arms Control Negotiations: Fourth Round

Geneva, 16 January–4 March 1986

■ The Soviet and US negotiators met for their fourth round of nuclear and space talks, committed by the Gorbachev–Reagan Summit communiqué of November 1985, to ‘accelerate’ their negotiations.²⁴ The previous three rounds had largely been deadlocked owing to differences over the US Strategic Defense Initiative (SDI). During the third round, however, Soviet and US proposals had been tabled which covered all three areas of the talks: strategic nuclear weapons; intermediate-range nuclear weapons; and space and defensive weapons.²⁵ It had been expected that the fourth round would entail a detailed examination of these existing proposals. Instead, much of the new round was spent in the elaboration of further Soviet and US formulae for arms control. Notwithstanding the agreement of confidentiality on matters of substance at the talks, the two sides’ proposals were widely publicised.

On 15 January 1986, just prior to the resumption of the talks, Mikhail Gorbachev announced on Soviet television a new initiative for ‘Nuclear Disarmament by the Year 2000’. The content of the announcement was then formally conveyed at the Geneva talks by the chief Soviet negotiator, Viktor Karpov. The fifteen-year timetable for the ‘complete elimination of nuclear weapons throughout the world’ was to be followed in three stages:

- stage one, lasting from five to eight years, involved a mutual 50 per cent reduction in US and Soviet strategic nuclear weapons, to leave no more than 6,000 strategic nuclear charges each. It also involved the elimination of the two sides’ respective intermediate-range nuclear forces (INF) within range of Europe; a freeze on the nuclear forces of the European nuclear powers (Britain and France); and a ban on the transfer of strategic weapons from the superpowers to their allies.

- stage two, starting in 1990, and lasting five to seven years, would involve the participation of the other nuclear weapon states (Britain, China and France). There would be a freeze on all their nuclear weapons, and the continuation of the superpowers’ cuts until the Soviet Union and US reached their target of 50 per cent mutual reductions. At that point all tactical nuclear weapons (with a range of up to 1,000 kilometres) would be eliminated. Meanwhile, the space weapons programmes of all countries would have been terminated.

- stage three, beginning not later than 1995, and lasting till the year 2000, would involve the elimination of all remaining nuclear weapons, and the enacting of a universal ban.

All stages were to entail special procedures for dismantling and verification, including on-site inspection. All proposals were to be contingent on a mutual renunciation of space strike weapons. Mikhail Gorbachev also announced a three-month extension of the Soviet Union’s unilateral nuclear testing moratorium, which had expired on 31 December 1985. It was now to run until 31 March 1986, and beyond that, with appropriate verification including on-site inspection, if the US would join it.²⁶

North-South Monitor

While the US formally rejected the invitation to join the extended nuclear test ban, on the basis that the Soviet Union had completed its own tests prior to announcing its moratorium, initial reactions to Gorbachev's plan were guardedly welcoming. It was the first Soviet proposal which did not insist on the retention of Soviet SS-20s in Europe to match British and French nuclear forces. It became apparent, moreover, that the Soviet offer on eliminating INF from Europe was not made conditional on the termination of SDI, but was 'free-standing'.²⁷ After consultations with its allies, however, major problems were discerned by the US in the Soviet proposal. Representatives of Japan, Australia and China voiced serious concern over the absence of any initial reduction in mobile Soviet SS-20s based in Asia. Britain and France were concerned at the requirement that they cease to enlarge or modernise their forces (which would include Britain's forgoing the new Trident missile system), and insisted on negotiating separately with the Soviet Union, after the superpowers had enacted their strategic weapon reductions. Other Western European representatives were reported to have expressed concern for their own countries' security, if US INF were to be removed from Europe, and a ban placed on receiving US strategic nuclear weapons. Fears were raised of the 'political de-coupling' of Western Europe from the US.

The official US response to Gorbachev's proposal came in a letter to the Soviet leader, the content of which was conveyed at the Geneva talks on 24 February 1986. President Reagan chose to focus on the INF element of the offer, proposing his own three-stage plan for the global elimination of INF within the next three years.

- the first year would involve a reduction of INF in Europe to 140 launchers each, with a proportionate cut in Soviet SS-20s in Asia.
- in the second year the numbers remaining would be halved again.
- by 1989, more than 200 US-built Pershing-2 and cruise missiles in Europe, and more than 400 Soviet SS-20s in Europe and Asia would have been removed.

The plan would also involve the withdrawal of Soviet short-range SS-22s and SS-23s from East Germany and Czechoslovakia. The freeze on British and French nuclear forces was rejected on the basis that the US could not negotiate on behalf of its independent allies. Also rejected were the suggestions of a ban on the transfer of US missiles to its allies, and of a test ban. No attempt was made to match Gorbachev's strategy for the elimination of strategic nuclear weapons by 2000, but the US offer of 50 per cent cuts in strategic forces was emphasised.²⁸

The US proposal was not discussed in detail at the talks, but the initial Soviet reaction, as expressed by Mikhail Gorbachev in his address to the Soviet Communist Party Congress appeared hostile.²⁹ The negotiations were further complicated by a suggestion from Gorbachev that the holding of a further superpower summit in the summer or autumn of 1986, could be dependent on progress at the Geneva talks, particularly on the issues of INF in Europe, and the nuclear test ban. At the close of the talks, the US negotiator, Max Kampelman, said that both sides were committed to a separate agreement on INF. Serious differences remained, however, concerning the nature of such an agreement as well as the remaining areas of strategic and space weapons, and test banning.³⁰

● Instead of wasting the next 10-15 years by developing new, extremely dangerous weapons in space, allegedly designed to make nuclear arms useless, would it not be more sensible to start eliminating those arms and finally bring them down to

North-South Monitor

zero?' Mikhail Gorbachev, the Soviet leader, in his statement on Soviet television. *Soviet News* (London) 22 January 1986.

'Many elements contained in the response are unchanged and continue to cause us serious concern. There are others that at first glance may be constructive.' US President Ronald Reagan's initial reaction to the Gorbachev proposal. *Armament and Disarmament Information Unit (ADIU) Report* (Sussex) January-February 1986.

'In our view the total elimination of nuclear weapons will require at the same time the correction of the conventional and other force imbalances, full compliance with existing and future treaty obligations, peaceful resolution of regional conflicts and a demonstrated commitment by the Soviet Union to peaceful competition.' President Reagan's considered response to the Soviet proposal, contained in his letter to Mikhail Gorbachev. Quoted in *Financial Times* (London) 25 February 1986.

'It is hard to detect in the letter we have just received any serious preparedness of the US Administration to get down to solving the cardinal problems involved in eliminating the nuclear threat.' Mikhail Gorbachev in his speech to the Soviet Communist Party Congress. *IHT* (Paris) 26 February 1986.

NORTH ATLANTIC TREATY ORGANISATION (NATO)

▲ Nuclear Planning Group (NPG)

Würzburg, West Germany, 20-21 March 1986

■ NATO defence ministers met in closed session for their biannual review of nuclear issues. The discussions were reported to have been dominated by the US Strategic Defense Initiative (SDI).

General James Abrahamson, the US Director of SDI, apparently briefed the NPG on advances in fibre optics, lasers and infra-red detectors. He also told the ministers that a decision on the deployment of SDI might be expected before the projected date in the early 1990s. Following the meeting, Caspar Weinberger, the US Defense Secretary, told a press conference that he had assured the NPG that SDI would not be bargained away in return for arms reductions at the Geneva talks. (See above: Geneva Arms Talks)

The ministers apparently discussed the possibility of a system related to the US SDI, which would protect Europe against attacks from shorter-range nuclear missiles. General fears had been expressed for the security of Europe if SDI were to render the present system of nuclear deterrence ineffectual, while failing to protect Western Europe from attack. The West German Defence Minister, Manfred Wörner, had been reported as having advocated a specifically European defence initiative to parallel SDI. At a press conference following the meeting, however, he agreed that SDI would provide defence for Europe against Intercontinental Ballistic Missiles (ICBMs), medium-range and some shorter-range missiles. The system being discussed in the NPG related simply to a more efficient system of defence against shorter-range tactical missiles and aircraft. The US invited companies in all NATO countries to tender 'European architecture studies' detailing designs for the

North-South Monitor

defence of Europe against such threats. At the time of the meeting, only Britain had concluded a formal, governmental agreement of participation in SDI, but just prior to the meeting, Caspar Weinberger and Chancellor Helmut Kohl announced a basic agreement for private West German companies to participate in the programme.

The closed meeting was also reported to have discussed the Rogers Plan for modernising tactical weapons in Europe, and specifically Britain's plans for modernising its nuclear deterrent through the acquisition of the US Trident D5 system, and new battlefield weapons. Details of the discussions on these issues were not disclosed.³¹

● 'Strategic Defence is one of the very highest priorities of our government and one of the highest priorities of our President . . . It is not a bargaining chip. It will not be set aside in response to any demand in connection with any arms reduction agreement.' US Defense Secretary, Caspar Weinberger *IHT* (Paris) 22-23 March 1986.

WARSAW PACT

▲ Foreign Ministers' Committee Meeting

Warsaw, 19-20 March 1986

■ Foreign ministers from the seven Warsaw Pact countries (Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania and the Soviet Union) met for the first time since the Soviet leader, Mikhail Gorbachev, announced his plan for nuclear disarmament by the year 2000, on 15 January 1986. (See above: Geneva Arms Talks.)

According to their final communiqué,³² the ministers fully endorsed Gorbachev's programme for liquidating all arsenals of nuclear and chemical arms before the end of the century. They stressed a number of points:

- Alarm was expressed at the continuing deployment of US medium-range missiles in Western Europe. The ministers advocated the complete elimination of Soviet and US medium-range missiles—both ballistic and cruise missiles—in Europe. Such a measure, they said, would require a US commitment to refrain from transferring its strategic and medium-range missiles to Europe, and a pledge by Britain and France not to increase their nuclear arsenals. Once US missiles were eliminated in Europe, they said, there would be no further need for Soviet tactical missiles of enhanced range.
- The Warsaw Pact countries supported proposals for nuclear-free zones in Nordic Europe, the Balkans and the Central European corridor dividing 'East' from 'West', and for chemical weapon-free zones in Central Europe and the Balkans.
- They said that the elimination of nuclear weapons should be accompanied by 'an appropriate reduction of conventional armaments and armed forces'.
- They stated that preserving a peaceful outer space is the necessary prerequisite for carrying out far-reaching cuts and eliminating nuclear weapons. They also pointed out what they saw as dangers entailed in projects such as the 'European Defence Initiative', a space weapons programme related to the US SDI, advocated in some European countries.

North-South Monitor

- They reaffirmed the need for an end to nuclear testing, calling on the US to match the Soviet Union's unilateral testing moratorium, which had been extended till 31 March 1986.
 - They reemphasised their peace proposals, advanced at the Warsaw Pact summit in Sofia in October 1985.³³
 - It was stressed that the forthcoming superpower summit should concentrate on paving the way towards arms agreements, particularly on the two issues of test banning and eliminating nuclear missiles in Europe.
- The next foreign ministers' meeting was to be held in Bucharest.³⁴
-

THE NORTH

▲ Group of Five (G5)

Meeting of Finance Ministers
London, 18–19 January 1986

■ Finance Ministers and Central Bank Governors from the five major industrialised countries (Britain, France, Japan, US, West Germany) met for the second time since their New York agreement in September 1985. Dubbed the 'Plaza Pact', that agreement was to reduce the value of the US dollar by means of intervention in the exchange markets.³⁵

Billed as a 'private and informal' meeting, the full agenda of the discussions was not revealed. However, the participants were understood to have expressed satisfaction with progress on the lowering of the dollar, and to have been in favour of resisting any subsequent rise in its value. A brief, vaguely worded communiqué said that 'they agreed that their cooperation should continue and that the progress that had been made should not be reversed'. There was, however, no explicit commitment to further major currency intervention in the manner presaged by the September 1985 agreement.

The participants were understood to have discussed the possibility of collective action to lower interest rates. While G5 was not averse to members reducing interest rates unilaterally, it ruled out a Japanese proposal, supported by the French, for a form of concerted 'interest rate disarmament'. The British and West German representatives were known to be wary of such a move. It was also reported that while the US Treasury Secretary, James Baker, may have been in favour of lowering interest rates (not least to relieve pressure on debtor countries) the US Federal Reserve Chairman, Paul A Volcker, was concerned not to do so at a time when the US economy was strengthening. It was reported that the meeting had simply held that the prospects for falling inflation would contribute to a favourable climate for lower borrowing costs. No mention of interest rates was made in the communiqué.

The G5 meeting was understood to have discussed the 'Baker Plan' to assist indebted developing countries,³⁶ and to have lent it its support.³⁷

Soon after the London meeting, some members of G5 lent support to the possibility of its being joined by Italy and Canada. Both countries, members of the seven-nation Western Economic Summit, had complained of their exclusion from G5 meetings in which international monetary decisions affecting their own economies were taken.³⁸

North-South Monitor

NORTH-SOUTH

▲ European Economic Community (EEC)—Southern African Frontline States
Meeting of Foreign Ministers
Lusaka, 3–4 February 1986

■ Foreign Ministers from the Southern African frontline states (Angola, Botswana, Mozambique, Tanzania, Zambia and Zimbabwe) met for the first time with a ministerial delegation from the twelve EEC countries. The EEC had been invited to open a political dialogue with the frontline states focusing on efforts to end apartheid and accomplish reform in South Africa, following an initial proposal in April 1985 from the then President of Tanzania, Julius Nyerere. The European delegation was led by the Netherlands' Foreign Minister, and current Chairman of the EEC Council of Ministers, Hans van den Broek. He was accompanied by the British Foreign Secretary, Sir Geoffrey Howe, and by junior ministers from the other EEC countries.

The chief area of contention at the meeting was the issue of economic sanctions against South Africa. President Kaunda of Zambia appealed to the European countries to apply comprehensive economic sanctions, warning that their investments in South Africa would 'go up in flames' in the imminent conflagration. The African ministers were unanimously dismissive of the announcement made by President Botha in the South African Parliament on 31 January 1986. The South African President had proposed reforms including the abolition of influx control regulations, the restoration of South African citizenship to citizens of the 'independent' homelands, and measures to involve black communities in 'decision-making'.³⁹

Hans van den Broek announced that the EEC was not prepared to move beyond the sanctions it had already agreed in September 1985, and which had just come into force on 31 January 1986. There was, however, a split between countries within the EEC delegation. Britain, which had isolated itself at the Commonwealth summit in Nassau, in October 1985, by standing against comprehensive economic sanctions,⁴⁰ was arguing against increased international pressure against South Africa. Sir Geoffrey Howe, while criticising Botha's recent proposals for failing to address the central issue of power-sharing, argued that punitive measures should not be applied just as Pretoria was indicating signs of change, even though the pace was 'desperately slow'.⁴¹ Britain was supported in its opposition to a strongly worded final communiqué by West Germany. The representatives of Denmark, Greece, Ireland and Spain, however, led by the French Deputy Minister of Energy, Martin Malvy, called for stronger restrictive measures against South Africa, and a bold declaratory communiqué.

A final joint communiqué called on South Africa to stop destabilising its neighbouring countries, and dismantle apartheid, urging the international community to apply further pressure to this end. A five-point plan for peace in South Africa advocated:

- 1 The lifting of the state of emergency;
- 2 The recognition of banned political parties such as the African National Congress.

North-South Monitor

- The release of Nelson Mandela;
- The freeing of all political prisoners and detainees;
- The opening of dialogue between Pretoria and all political leaders, including blacks in detention.

Britain conceded to the statement that the EEC would consider further 'restrictive measures' against Pretoria if the current European sanctions failed to have the desired results. In return for this concession, Britain secured support from the meeting for the Commonwealth Group of Eminent Persons, which had been set up at Nassau to promote political dialogue between the opposing groups in South Africa. An attempt by Britain to include mention of the need for a cessation of violence on both sides, in support of the Group's mediation efforts was, however, rejected. The frontline states' ministers, while expressing satisfaction with the joint communiqué, were reported to have been disappointed that no condemnation was secured of the recent welcome afforded by Washington to the South-African backed Angolan rebel leader of UNITA, Jonas Savimbi.⁴²

● It seems that Europe does not 'care about what is happening in this region so long as their multinationals continue to earn huge profits from their investments in South Africa because of the black man's cheaper labour. They regard South Africa as stable and therefore safe for their investments. How else can we interpret the reluctance and in some respects strong opposition to economic sanctions as a suitable instrument for peaceful change in South Africa?' President Kenneth Kaunda of Zambia in his opening address. *The Guardian* (London) 4 February 1986.

▲ First International Conference on Trees and Forests Paris, 5-6 February 1986

■ Representatives from sixty-two countries, including ten heads of state or government, participated in the conference, entitled 'Silva', which had been initiated by the French government. International organisations, such as the European Economic Community (EEC), the Organisation of African Unity (OAU), the UN Food and Agriculture Organisation (FAO) and the Intergovernmental Authority on Drought and Desertification (IGADD) were also represented. The dual focus of the conference was the danger posed to the forests of Europe by atmospheric pollution and forest fires, and the problem of desertification in Africa, caused by drought, the excessive use of fuelwood, overgrazing and bush fires. The issue of tropical forests was excluded from the conference, but may form part of a later meeting.

The President of the EEC's Commission, Jacques Delors, presented the conference with statistics on the depletion of forests, saying that every year from the South Sahara to the north of West Africa, 3.6m hectares of forest disappear (an area equivalent to the size of Belgium), while only 0.1 hectares is planted with new trees. President Mitterrand of France stressed the need for rapid corrective action, given the length of time required for trees to grow to maturity. Edouard Saouma, Director-General of FAO, cited the need for international cooperation to combat the loss of forests, involving East-West cooperation to tackle the problem of acid rain, which particularly affects Central European forests, and North-South collaboration in tackling desertification.

North-South Monitor

The conference participants made firm commitments to protecting forests, calling for increased education and information, the mobilisation of increased funds, the coordination of the institutions concerned and the intensification of forestry research. They advocated the halting of the spread of desert, through the development of substitutes for fuelwoods and through the prevention of overgrazing. President Thomas Sankara of Burkina Faso emphasised in this context the need to tackle the problem at village level, rather than imposing grandiose schemes from above. A fund-raising plan was launched as part of the 'Paris Appeal' and several industrialised countries pledged increased aid for research and re-afforestation programmes. France promised to double its forestry assistance to the Sahel to 500m French Francs over the next five years, and other pledges followed from West Germany, the Netherlands and Japan. A proposal from the OAU Chairman, President Abdou Diouf of Senegal, to divert one per cent of research credits from space to more urgent forestry research was not, however, taken up.

Despite general agreement that the problems of the Sahelian and Sudanese drylands were more urgent than those of Europe, European problems appear to have received more constructive attention from the conference. More precise identification of forest decline was called for; the twenty-one parties to the 1985 Helsinki Convention, aiming to reduce sulphur emissions by thirty per cent, were encouraged to comply with its provisions, and others to ratify it; and a French proposal invited the participants of the conference to establish an 'advanced research network on arboreal physiology in Europe', to be called 'Eurosilva'.⁴³

● 'Trees are endangered, our environment is threatened and natural resources are being irreversibly destroyed. The consequences of this crisis are planet-wide and only the wholesale mobilisation of public opinion, with massive political backing, will enable us to tackle them.' Edouard Saouma, Director-General of FAO, to the conference. *UN Press Release PR 86/6*, 5 February 1986.

'The deforestation of today is the drought of tomorrow and the famine of the day after.' President François Mitterrand of France, to the conference. *Development Forum* (New York) April 1986.

▲ First International Francophone Summit Paris, 17-19 February 1986

■ The first ever francophone summit was attended by heads of state and government, or high-level representatives, from thirty-nine countries 'having in common the use of French'. These countries, representing a combined population of 120m people, ranged from those where French is a dominant or official language, to Caribbean states such as Dominica, Haiti and St Lucia where a French patois is spoken, and former British colonies or protectorates with a substantial French influence such as Canada. There was, however, no separate representation for remaining French territories, so that while Mauritius, the Seychelles and Vanuatu were represented, Martinique, Guadeloupe and Réunion were not. Laos, Vietnam and Switzerland attended only as observers, and notable absentee Arab countries included Algeria and Syria. Cameroon also declined to participate, on the basis that the country was officially bilingual rather than francophone.⁴⁴

North-South Monitor

The idea of a francophone summit had first been mooted in the early 1960s, notably by President Léopold Senghor of Senegal and President Habib Bourguiba of Tunisia. Its progress had been thwarted partly by initial reservations on the part of the French President, Charles de Gaulle, and partly by continuing disputes over the role of Quebec in such a summit. The former Canadian Prime Minister, Pierre Trudeau, had rejected French and Québécois demands that Quebec be seated at any conference, perhaps concerned that Quebec's international image might be enhanced at the expense of that of the federal government in Ottawa. A compromise between the Canadian Prime Minister, Brian Mulroney and the Québécois, reached late in 1985 and subsequently accepted by the French government, removed the remaining obstacle to the convening of a summit. Quebec was to be seated at the conference, but given a limited right of intervention which encompassed linguistic, cultural and communication matters, while broad international political and economic issues were to remain the prerogative of the federal representative. The Paris summit was accordingly attended by separate delegations from the federal government and from the Canadian provinces of Quebec and New Brunswick. Belgium, too, had separate representation for its French community, bringing the number of delegations at the summit to forty-one.

The focus of the summit was on improving cooperation between francophone states in the fields of development, education, research and communications, and in creating French terminology to keep abreast of scientific and technological advances, fast becoming the exclusive preserve of the English language. In his opening speech, President Mitterrand appealed for the preservation of linguistic diversity, and for the use of the French language to help fight poverty and hunger. In the political realm, a Canadian resolution on apartheid was passed, calling for its termination, the release of Nelson Mandela, and the lifting of the ban on the ANC. Despite calls for the application of mandatory sanctions against South Africa by Senegal's President, Abdou Diouf, Chairman of the Organisation of African Unity (OAU), economic sanctions were not seriously discussed. Equally, discussion of Chad and Haiti, from which former President Jean-Claude Duvalier had just fled to France, remained informal. Prime Minister Walter Lini of Vanuatu, the only Pacific territory represented, did, however, protest against France's nuclear testing policy in the South Pacific. His speech, though, was delivered not in French, but in his native language, Bislama.

Twenty-eight practical measures were approved by the summit to encourage the use of French, of which the focal point was the creation of a television agency for the world-wide broadcasting of French-language programmes, the Agence Internationale Francophone d'Images de Télévision (AITV), which was to have an initial three-year budget of 16m French Francs. 'Francophone' programmes for France's four television channels in 1987 were to be encouraged, and the new French cable channel, TV5, used for broadcasts to North America and Africa. Other projects included:

- the creation of a working group on linguistic data banks, to extend and coordinate the use of French language data banks
- a study on the use of French videodiscs for medical teaching
- a biennial francophone book fair in Paris
- an international prize for French linguistic innovation

North-South Monitor

- a francophone international baccalauréat
- the founding of agronomic institutions in the Third World
- African energy studies for the Sahel.

These projects were largely backed by French and Canadian resources, and Canada announced a further 350 scholarships for students from francophone countries. The summit also created a follow-up committee consisting of ten countries, including Mali, Senegal and Zaire.⁴⁵

The next biennial francophone summit was scheduled for Quebec, in 1988.

● 'The South like the North is in danger of by-passing French if it should cease to assert itself as an instrument of scientific and technical communication. It is the fate that other languages have known when they ceased to live in their time. Let us make sure it does not happen to the French language.' Brian Mulroney, Prime Minister of Canada, to the conference. *West Africa* (London) 3 March 1986.

SOUTH-SOUTH

▲ Islamic Conference Organisation (ICO or OIC)
Sixteenth Islamic Foreign Ministers' Conference
Fez, Morocco, 6-10 January 1986

■ Foreign ministers from the ICO's forty-five member-states considered US-Libyan tensions, the Gulf war and the Palestinian question among other issues on the annual meeting's ninety-point agenda.

In a statement, the ministers declared their solidarity with Libya, and their support for its efforts to defend its land and territorial waters. They drew the attention of the international community to 'the continuing provocations and aggressive escalation carried out by international imperialism and the Zionist entity' against Libya, and the consequences of this escalation for world security. They considered the 'Zionist-imperialist threat' directed against Libya as a threat to all Islamic states.⁴⁶ The statement was reported, however, to have been less radical than the original Libyan proposal from which it was derived, owing to an intervention by the Iraqi Foreign Minister, Tariq Aziz. In an apparent reference to Egypt, Tunisia, Chad and Sudan, Tariq Aziz had accused Libya of interference in neighbouring Islamic states, as well as in other countries.

A later resolution of the conference specifically named the US, in condemning its economic sanctions against Libya (imposed in January 1986) as contrary to international laws and practice. Reiterating its solidarity with Libya, the conference called on the US to revoke its measures, and on Islamic countries to 'adopt whatever measures they deem necessary to face up to these arbitrary American measures'.⁴⁷ No specific measures to counter US sanctions were agreed upon, despite reported attempts by the Libyan Foreign Minister, Ali Abdessalam Treiki, to secure a Muslim boycott of US goods, and a withdrawal of Arab investments from the US.⁴⁸

Despite extensive discussions on the Gulf war, no statement on the conflict could be agreed upon. The final statement contained references to other issues. On the Palestinian question, the ministers condemned the Israeli attack against the PLO

North-South Monitor

offices in Tunisia, and reaffirmed their commitment to the principles on which they believed any solution must be founded, such as the need for a complete withdrawal from the Occupied Territories, and the restoration of the natural rights of the Palestinian people. They welcomed the suggestion of the UN General Assembly for an international conference on the issue, under the auspices of the UN, with the participation of the PLO and the permanent members of the UN Security Council, including the US and the Soviet Union. The conference condemned US support for Israel, the Israeli decision to annex Jerusalem and the Syrian Golan Heights, the Israeli occupation of parts of Southern Lebanon and the resumption by some countries of diplomatic relations with Israel. They warned that such a re-establishment of links could have a negative effect on relations with Arab and Islamic countries.

The Conference heard a report from a representative of the Afghan Mujahideen, and praised their struggle for national liberation against the Soviet occupation of the country. It also considered the question of various Muslim minorities in the world, declaring its sympathy with the Turkish Cypriots, the Turkish Muslim minority in Bulgaria, and the Moro National Liberation Front as the legitimate representative of the Moro Muslims in the Philippines. Support was also lent to proposals for nuclear weapon-free zones in Africa, the Middle East and South-East Asia, to the South African and Namibian liberation struggles, and to the countries experiencing drought in the African Sahel.

During the meeting, Nigeria was admitted as a full member of the ICO (bringing the membership to forty-six) having previously had only observer status.⁴⁹ Efforts to question Egypt's readmission to the ICO in 1984 (it was suspended in 1979 following the conclusion of the Camp David Accords) failed. Iran, Libya and Syria had called for Egypt to sever its continuing relations with Israel, or be suspended from the organisation. Attention was drawn by the ICO Secretary-General, Syed Sharifuddin Pirzada, to a growing financial crisis within the body. He called for budget contributions to be made wholly obligatory, rather than leaving a portion of them voluntary, as roughly half of the 1985 budget's \$9m was still outstanding.

The next ICO summit was scheduled for Kuwait in January 1987.⁵⁰

● 'Libya continues to threaten neighbouring Islamic countries as well as other countries further afield.' Tariq Aziz, Iraqi Foreign Minister. *BBC Summary of World Broadcasts* (London) ME/8152/A/1, 9 January 1986.

'The majority of the international community is now opposing the US threat against Libya.' Ali 'Treiki, Libyan Foreign Minister, speaking after the first conference statement on Libya. *The Guardian* (London) 8 January 1986.

▲ Permanent Committee for Arab-African Cooperation
Ministerial Conference
Damascus, 17 January 1986

■ The twenty-four African and Arab countries participating in the meeting issued a statement condemning US actions against Libya, and stressing the illegality of the

North-South Monitor

economic measures imposed. They called on members of the OAU, Arab League and all international organisations to oppose them.

According to a press conference given after the meeting by the Arab League Secretary-General, Chedli Klibi, and the Organisation of African Unity (OAU) Secretary-General, Ide Oumarou, the ministers also discussed the situation in the Occupied Territories, Southern Africa, and the Gulf war. Israel's policies in the Middle East were denounced, particularly its practices in the Occupied Territories and its occupation of Lebanon. The conference demanded a halt to the Iran-Iraq war. It also denounced the South African regime, and its imposition of an embargo on all trade to and from Lesotho, and called for support for the Namibian liberation struggle.

Two agreements were signed by the OAU and Arab League Secretaries General, involving cooperation between the two organisations, and the reinforcing of the political and economic boycott against Israel and South Africa. An educational agreement was also signed between the OAU and the Arab Organisation for Education, Culture and Science, and further steps taken towards economic cooperation: the ministers agreed to establish a coordination committee for the important economic bodies of the OAU and the Arab League, and one for the two secretariats, to implement economic cooperation policies.

A second Arab-African summit was planned for 1987, ten years after the first one took place in Cairo, in 1977.⁵¹

▲ Arab League

Council of Foreign Ministers

Extraordinary Session and Eighty-fifth Regular Session

Tunis, 31 January 1986 and 24-27 March 1986

■ At their meeting in March, foreign ministers from the twenty-one member-states of the Arab League focused on tensions between the US and Libya, which had been the subject of an earlier special session, and on recent developments in the Gulf war.

The emergency Council session in January 1986 had been convened at the request of Libya to discuss hostile US actions against her. On 7 January 1986, President Reagan had announced a trade embargo against Libya, and ordered virtually all US citizens to leave the country, apparently in response to terrorist attacks on Rome and Vienna airports in December 1985, in which the US believed Colonel Gaddafi of Libya to be implicated. The US Sixth Fleet had also conducted air and sea manoeuvres near the Gulf of Sidra, in the last week of January 1986. The Arab League Council had adopted a resolution condemning the US boycott and military manoeuvres, and had affirmed its support for Libya.⁵²

The Council's regular session in March coincided with further hostilities between the US and Libya, over the disputed Gulf of Sidra, involving the exchange of fire, and successful US attacks on Libyan patrol boats and a missile site in Libya. The Council passed a unanimous resolution supporting Libya against what it termed US

North-South Monitor

aggression, which threatened the security of all Arab countries. It called on the government to cease its military operations against Libya, and warned of the danger of such antagonism. It also called on Arab countries to extend assistance to Libya each according to its means, to repel US attacks, and to request a UN Security Council meeting to discuss the situation in the Mediterranean. Kuwait and Jordan were reported to have expressed reservations on the resolution. The ministers were also reported to have rejected, in their closed session, a Libyan request for the imposition of economic sanctions on the US.⁵³

The Council made a separate statement on the Gulf war, adopted with reservations on the part of Syria and Libya. The statement expressed solidarity with Iraq and profound anxiety over continued 'Iranian aggression and occupation of Iraqi territories'. It also expressed concern over what it took to be an Iranian threat to all the Arab Gulf states, particularly since Iran's recent offensive, and it renewed appeals to Iran to respond to international peace initiatives. The Council decided to remain in continuous session, and requested that the Arab League Secretary General, Chedli Kheib, provide it with a report on further developments in the conflict, in order for it to take appropriate action.⁵⁴

▲ Arab League Council

Special Session of the Committee on the Gulf War
Baghdad, 12 February 1986

■ The seven-member committee of the Arab League Council assembled for an emergency meeting following a new Iranian offensive in the East Basra and Shatt al-Arab areas, during which Tehran claimed to have blocked Iraq's access to the Gulf. The committee, established at an emergency session of the Arab League, on 1 March 1984, is composed of the foreign ministers of Saudi Arabia, Kuwait, Jordan, Tunisia, Morocco, North Yemen and Iraq.

In a statement,⁵⁵ the committee strongly condemned Iran's 'new large-scale aggression' against Iraq, which it said was aimed at occupying more Iraqi territory and threatening the security, sovereignty and territorial integrity of the whole Arab Gulf region. The committee reaffirmed its solidarity with Iraq, warning Iran that aggression against an Arab League member would force the Arab states to reconsider their relations with Tehran. It accordingly appealed to Iran to cease attacks against Iraq.

The committee called upon the UN Security Council to hold an urgent meeting to review the developments in the Gulf war, and to seek a peaceful settlement to the dispute.⁵⁶

▲ Gulf Cooperation Council (GCC)

Council of Foreign Ministers: Eighteenth Session
Riyadh, 1-3 March 1986

■ Foreign ministers from the six GCC states (Bahrain, Kuwait, Oman, Qatar, Saudi Arabia and UAE) reviewed developments in the Gulf war following the receipt

North-South Monitor

Iranian offensive in the Faw peninsula. In their final communiqué,⁵⁷ they condemned 'Iran's occupation of portions of Iraqi territory', and called on Iran to withdraw its forces immediately to international borders. The statement signalled the end of a brief period of tentative rapprochement with Iran, initiated at the GCC summit meeting in Muscat in November 1985.⁵⁸ During that summit, the GCC leaders had appeared to favour a more neutral stance in the war, in contrast to their previous firm alignment with Iraq.

At its Riyadh meeting, the Council also censured Iranian threats against GCC countries, in apparent reference to Iranian warnings that the Gulf states should abandon their support for Iraq, and alter their oil policies. The threats, the communiqué said, expanded the scope of the conflict and further undermined the security and stability of the region. The ministers noted that the GCC's rapid intervention force, the Peninsula Shield, was ready to move to any site affected by recent developments in the war. Following the Council session, GCC Chiefs-of-Staff met in Riyadh to prepare contingency measures.

The Council decided to intensify its contacts with Arab and other states in an attempt to contain the war.⁵⁹

● 'The Iranian presence in Faw . . . is a direct threat to member states of the GCC.' Youssef Al Alawi, Omani Minister for Foreign affairs. *Kuwait Times* (Safat) 5 March 1986.

▲ Organisation of Petroleum Exporting Countries (OPEC)

Ministerial 'Market Share' Committee

Vienna, 3-4 February 1986

Ministerial Monitoring Committee (MMC) and Extraordinary Ministerial Conference

Geneva, 15 March and 16-24 March 1986

OPEC-Non-OPEC Oil Exporting Countries

Geneva, 19-21 March 1986

■ The seventy-seventh ministerial conference, attended by oil ministers from OPEC's thirteen member-states, ended in profound disagreement over two related issues: the overall level of OPEC oil production to be determined; and the percentage share, for individual members, of the proposed output.

OPEC's previous ministerial conference in Geneva, in December 1985, had decided to 'secure and defend for OPEC a fair share in the world oil market consistent with the necessary income for member-countries' development'.⁶⁰ It was, however, uncertain as to what constituted this 'fair share', and how OPEC members could remain united behind this policy in the face of the price collapse prompted by their decision, in effect, to abandon curbs on production. A ministerial committee, consisting of Indonesia, Iraq, Kuwait and UAE and chaired by Venezuela, was unable at its meeting in Vienna to recommend a definite output level. It merely suggested that the 'fair share' would be higher than OPEC's existing production ceiling of 16m barrels per day (b/d). It also advocated cooperation between OPEC and non-OPEC producers in stabilising the market.⁶¹

North-South Monitor

A division, barely concealed even at the December 1985 meeting when the original policy decision was taken, emerged between the Gulf oil states (such as Saudi Arabia, Kuwait and UAE) and the so-called 'radical' states (Algeria, Libya and Iran). The Gulf states, best equipped to withstand the effects of a price war, by reason of their spare, low-cost production capacity and financial resources, generally remained in favour of securing agreements with non-OPEC producers to curb production, as a means to restoring oil prices.⁶²

The radical states, on the other hand, had coordinated their positions at meetings in Tripoli on 6 February 1986, and Algiers on 17-18 February 1986.⁶³ They advocated that OPEC, and particularly Saudi Arabia, the largest producer, bear the whole responsibility for restoring the official OPEC price of \$28 per barrel, by sharply cutting production. Nigeria, too, was discovered to favour this position.⁶⁴

There appeared to be a general agreement that OPEC's production ceiling would have to be lowered, in line with projected demand. The MMC had estimated that demand for OPEC oil would be 16.3m b/d in 1986, against the nominal ceiling of 16m b/d agreed in October 1984, and the actual OPEC output level of around 17.5m b/d. Disagreements arose, however, over the way in which the necessary cut in output would be shared between OPEC members. Several countries, including Iraq, Ecuador, Nigeria and the UAE, had long been insisting on increases in their individual output quotas, and were reluctant to accept cuts in production, at least unless they were made from the higher levels they were demanding.

The Indonesian Oil Minister, Dr Subroto, presented a plan to the conference, suggesting a means of distributing the burden between members of a cut to 16m b/d in 1986, reduced to 14m b/d in the second quarter. He called for a 20 per cent cut in the Saudi Arabian quota, in the spring of 1986, with most other quotas being cut by 12.5 per cent, and by less for Iraq, the UAE, Gabon, Nigeria and Ecuador. A second Subroto plan suggested a Saudi Arabian cut of 16 per cent, and an overall reduction to 14.5m b/d in the spring. Neither plan proved acceptable to the conference, both Saudi Arabia and Venezuela categorically refusing any cut in production and only Kuwait, Indonesia and Qatar declaring themselves in favour of the proposals. A major impediment to any solution was the acrimonious dispute between protagonists of the Gulf war. While Iraq pressed its claim for a higher quota on the grounds that its ceiling was an 'artificial' one, determined at a time when its capacity was temporarily affected by war damage, Iran opposed any increase in Iraq's quota. Iran insisted on its own quota being increased by two barrels for every one granted to Iraq.

While the conference remained in deadlock, OPEC ministers held talks with ministers from five non-OPEC oil producing countries: Angola, Egypt, Malaysia, Mexico and Oman, accounting for a combined production of around 4.5m b/d. The key North Sea oil producers, Britain and Norway, who were refusing to cooperate with OPEC in lowering their output, were not present, nor was the Soviet Union. Brunei, though invited, declined to send a representative. The ministers discussed possible strategies for joint output cuts in order to raise prices, but the non-OPEC countries summarily dismissed an initial OPEC proposal that they cut their production by 20 per cent. The two groups nevertheless issued a memorandum of understanding, pledging cooperation to restore and defend the official OPEC price of \$28 per barrel. They agreed, however, that the cooperation of other, non-OPEC oil producers was required to achieve this end. They also advocated a more durable

North-South Monitor

and closer relationship between all oil producers in order to ensure long-term price stability in the oil market.⁶⁵

Unable to reach agreement, the OPEC conference adjourned until 15 April 1986, in Geneva.⁶⁶

● 'If we fail to conclude an agreement today, then we will be forced to strike a deal in two months, but all of us will be losers by then.' Sheikh Ali Khalifa al-Sabah, the Kuwaiti Oil Minister, speaking just prior to the end of the conference. *IHT* (Paris) 24 March 1986.

'I think that without the help of the outsiders, we will never be able to bring order into OPEC. Member-countries cannot reduce any further in reality.' Sheikh Ahmed Zaki Yamani, Saudi Arabian Oil Minister, speaking of the need for an agreement with non-OPEC oil exporters. *The Guardian* (London) 25 March 1986.

▲ Middle Country Debtors' Conference

San José, Costa Rica, December 1985

■ Government representatives from Latin American and Caribbean 'middle' and 'small' debtor countries met on the initiative of the Costa Rican government, to discuss the problem of the region's foreign debt. The countries attending were Bolivia, Costa Rica, Dominican Republic, Ecuador, El Salvador, Guatemala, Honduras, Nicaragua and Panama. Together, they accounted for a combined debt of more than \$30bn. Uruguay and Jamaica, which could also be classed as middle country debtors, did not attend.

In a joint communiqué, the representatives agreed that they experience more stringent conditions on their loans, and have a harder task in renegotiating them, because of their powerless status as individual small countries, in contrast to the region's major debtors, such as Mexico and Brazil. They called for 'greater understanding from the international community' and the establishment of a concerted position, in order to strengthen their collective negotiating power.⁶⁷

● 'We're suffering from the small debtor syndrome . . . Whichever way you look at it, the small debtors have proportionately the highest debt service in the world, we face the toughest conditions and we have the least capacity to pay; the renegotiation of the debts of small countries excites little international interest.' Ennio Rodríguez, Costa Rica's Special Adviser on External Debt, quoted in *IHT* (Paris) 27 January 1986.

▲ Cartagena Consensus

Emergency Ministerial Committee Meeting

Punta del Este, Uruguay, 28 February 1986

■ The Ministerial steering committee of the 'Cartagena Group' of Latin American debtor countries⁶⁸ met in an emergency session to review developments in the region's debt problem. The committee, composed of the finance and foreign ministers of Argentina, Brazil, Colombia, Mexico and Venezuela, and joined at the

North-South Monitor

Punta del Este meeting by Uruguayan ministers, was formed at the meeting of signatories to the Cartagena Consensus in Montevideo on 16–17 December 1985. It was set up to monitor the implementation of measures proposed by the Group in response to the 'Baker Plan'.⁶⁹

The emergency session of the committee was convened at the suggestion of Presidents Miguel de la Madrid of Mexico and Jaime Lusinchi of Venezuela, during their two-day summit in Cancun on 30 January–1 February 1986. They were particularly concerned with the effect on debtor countries of the fall in oil prices, following the OPEC Ministerial Conference in December 1985.⁷⁰ Their proposal for a meeting was supported by President Raúl Alfonsín of Argentina, after consultations with President José Sarney of Brazil.

The ministers reviewed developments in the region's \$370bn foreign debt, interest rates and commodity prices. They tacitly endorsed Mexico's attempt to negotiate an emergency financial agreement on its \$96bn debt, following the decline in its revenue, since the oil price collapse in January 1986. The focus of the ministers' efforts to reduce debt payments was on limiting interest rates. They fell short, however, of collectively determining a specific target interest rate level below current market rates, and Mexico was reported to have discouraged collective measures which could prejudice its own negotiations with creditors. Instead, the ministers agreed to support, after consultations, unilateral efforts by Cartagena members to reopen negotiations and to limit interest payments. The committee stated in its final communiqué that in the case of individual debtor countries, 'substantial modifications to existing debt agreements could no longer be postponed, in particular with regard to current interest rate levels'. It was understood that efforts to secure better terms in consultation with other Cartagena members, would have the backing of the whole group.⁷¹

● 'It is clear that the Baker Plan was overthrown by events and is not enough to deal with the crisis faced by Mexico and others.' Enrique Iglesias, Foreign Minister of Uruguay. *International Herald Tribune* (Paris) 3 March 1986.

▲ Contadora Group--Lima Support Group

Meeting of Foreign Ministers

Caraballeda, Venezuela, 11–12 January 1986

Contadora Group--Lima Support Group--Central American Countries

Meeting of Foreign Ministers

Guatemala City, 13–14 January 1986

■ The eight foreign ministers of the Contadora Group (Colombia, Mexico, Panama and Venezuela) and its Lima Support Group (Argentina, Brazil, Peru and Uruguay) met to establish guidelines for the continuation of the peace process in Central America. They assembled after a decision taken in December 1985 to suspend negotiations on the Contadora draft Central American peace treaty until May 1986, to await the outcome of forthcoming elections in Honduras, Guatemala and Costa Rica.⁷²

The ministers adopted the Caraballeda Message for Peace, Security and

North-South Monitor

Democracy in Central America, containing a ten-point statement of peace principles for the region, and a plan of action.⁷³ The ten principles were:

- a Latin American solution to the problem should be found, rather than construing it as part of a global East-West strategic conflict
- self-determination in the choice of each country's social and political system, establishing a government freely chosen by the majority
- non-intervention in each countries' internal affairs
- territorial integrity
- pluralistic democracy
- no stationing of weapons or military bases
- suspension of international military manoeuvres
- departure of all foreign troops and military advisers
- an end to foreign support for irregular forces operating in the region
- respect for human rights.

The Caraballeda Message relayed the ministers' plan to initiate diplomatic negotiations aimed at realising these principles, and leading, as soon as possible, to the signing of the Contadora peace treaty. In particular, they urged the resumption of the bilateral 'Manzanillo' talks between the US and Nicaragua, which had been suspended by the US in January 1985. They offered to mediate in these talks, and to promote 'national reconciliation' in internal conflicts within Central American countries. Finally, the two groups supported a proposal by the Guatemalan President to establish a regional parliament in Central America.⁷⁴

The eight foreign ministers subsequently held their first combined talks in Guatemala City with the foreign ministers of the five Central American countries (Costa Rica, El Salvador, Guatemala, Honduras and Nicaragua). They were attending the inauguration of the President-elect of Guatemala, Vinicio Cerezo, on 14 January 1986. The Central American ministers issued the 'Guatemala Declaration' after the meeting, in which they expressed support for the principles, objectives and initiatives contained in the Caraballeda Message.⁷⁵ Significantly, the message was endorsed by the three US allies in the region, Costa Rica, El Salvador and Honduras, despite its advocating US-Nicaraguan talks, and containing elements pointedly hostile to US policy. These included the explicit reference to US aid for the anti-Sandinista 'contras' contained in the opposition to foreign aid for irregular forces, and the call for a suspension of military manoeuvres in the region. The five ministers also endorsed the proposal for a regional parliament, and agreed to hold a regional summit meeting in Esquipulas, Guatemala in spring 1986. The Contadora and Support Group ministers determined to deliver their Caraballeda Message to the remaining countries with interests and ties in the region, including the US, Canada and Cuba, as well as to international organisations such as the UN, the Organisation of American States (OAS) and the European Economic Community (EEC).⁷⁶

● 'The best diplomacy is the art of speaking the truth although it appears a little harsh.' Augusto Ramirez Ocampo, Colombian Foreign Minister, referring to the outspoken nature of the Contadora Group's document. *The Guardian* (London) 14 January 1986.

North-South Monitor

▲ Contadora Group—Lima Support Group

Meeting of Foreign Ministers

Punta del Este, Uruguay, 27–28 February 1986

■ The eight foreign ministers discussed developments in Central America and assessed progress towards the objectives contained in their Caraballeda Message.

In a fourteen-point communiqué,⁷⁷ they expressed satisfaction that their message had been endorsed by the international community, and specifically by the five Central American governments. They welcomed the meeting between the deputy foreign ministers of Costa Rica and Nicaragua, held in Managua on 24 February 1986, with the participation of the Contadora Group foreign ministers. At that meeting, the Contadora Group had supported the creation of a border commission to contain hostilities between the two countries. The details of the international civilian peace-keeping force were to be devised at a meeting of Central American foreign ministers in San José on 12 March 1986.⁷⁸

The Punta del Este communiqué reaffirmed the principles of the Caraballeda Message, which it insisted were all necessary, and should be carried out simultaneously, not selectively, nor with conditional links between them. In particular, the ministers reiterated their opposition to external support for insurrectionist forces in the region, in an obvious reference to US President Reagan's plea in the US Congress on 25 February 1986 for \$100m in aid to the 'contras'. The Groups reaffirmed their willingness to mediate in efforts towards national reconciliation in the region. They also endorsed the suggestion of a regional Central American parliament, and welcomed the forthcoming Central American Presidents' summit in Esquipulas, Guatemala.⁷⁹

● 'The death of Contadora has been predicted many times, but it has shown a capacity to be reborn from the ashes.' Uruguayan President, Julio Sanguinetti, in his inaugural speech to the meeting. *BBC Summary of World Broadcasts* (London) ME/8196/D/1, 1 March 1986.

'We cannot accept the interference of support for armed groups in a country.' President Sanguinetti, in his opening speech. *The Guardian* (London) 28 February 1986.

'We hope there will be a chain reaction of this magnificent idea in the region.' Bernardo Sepúlveda, Mexican Foreign Minister, speaking of the Costa Rican–Nicaraguan border commission, and the hopes of the Contadora Group that a similar mechanism could be established between Nicaragua and Honduras. *The Guardian* (London) 1 March 1986.

▲ Kampuchea—Laos—Vietnam

Twelfth Regular Conference of Foreign Ministers

Vientiane, Laos, 23–24 January 1986

■ The Indochinese foreign ministers confirmed in a final communiqué⁸⁰ that the previously proposed withdrawal of 'Vietnamese volunteer forces' from Kampuchea would be completed by 1990. They also reconfirmed their positions on the political settlement of the Kampuchean question, as stated at previous meetings.⁸¹

Distinguishing between the internal and the international aspects of the question,

North-South Monitor

they said that the Kampuchean government was prepared to enter into talks with opposition Khmer, in order to achieve national reconciliation on two conditions: the removal of the 'Pol Pot clique'; and the holding of free general elections following the Vietnamese withdrawal from Kampuchea. It was said to welcome mediation to this end. An international settlement, they continued, would entail an agreement on Vietnamese withdrawal, together with an end to material and military aid to Pol Pot and 'other reactionary Khmer forces', to their use of Thai territory as sanctuary, and to military and other outside intervention in Kampuchea.

The communiqué expressed appreciation of the meeting in 1985 between the Indonesian and Vietnamese foreign ministers, as representatives of the Association of Southeast Asian Nations (ASEAN) and the Indochinese nations respectively. The meeting, together with the Indonesian-Vietnamese working group, aimed to promote a dialogue on the settlement of the Kampuchean problem.⁸² The Indochinese countries expressed a willingness to hold peace talks with Thailand, and Kampuchea declared itself ready to negotiate on the repatriation of Kampuchean refugees from Thailand. The progress in Lao and Vietnamese cooperation with the US in the search for missing Americans ('MIAs') was welcomed (with reservations about US reticence in the matter), and support declared for Vietnamese efforts to resume talks with China on normalising their relations. Finally, the ministers advocated setting up a zone of peace and cooperation in Southeast Asia.⁸³

▲ Organisation of African Unity (OAU)

Council of Foreign Ministers: Forty-third Meeting

Addis Ababa, 25 February–4 March 1986

■ The annual meeting of OAU foreign ministers included on its draft agenda various items on the dispute between the US and Libya over the Gulf of Sidra, and on the conflict in Chad.

President Hissène Habré of Chad had called on the Council to discuss the recent Libyan-backed offensive against the south of the country, launched by the forces of Goukouni Oueddi. He had called for wider backing among African countries of the French intervention on his country's behalf, which so far had received support only from the Ivory Coast, Senegal and Tunisia. President Habré, however, expressed scepticism as to the OAU's power to mediate effectively in the conflict. In the event, the Libyan delegation to the Council agreed to withdraw its draft resolution condemning French intervention in Chad, and though the Chadian delegation was allowed to present its case, there was no formal debate on the conflict at the meeting.

The Council issued a declaration of solidarity with Libya in the face of what it deemed to be hostile activity on the part of the US. The US, contending that the Gulf of Sidra constituted international waters, which should not be closed by Libya to international shipping, had conducted naval manoeuvres off the Libyan coast, and had been involved in confrontation with Libyan aircraft over the Gulf. It had also imposed economic sanctions against Libya in January 1986. The OAU Council appealed to the US government to end what it considered to be its boycotts, threats and provocations against Tripoli.

The Council adopted a budget of \$25m for the OAU Secretariat, for the period

North-South Monitor

1986-7, and urged member-countries to honour their financial commitments to the organisation by paying their arrears. It was also agreed in principle to cut posts and close three regional offices (in Kampala, Bangui and Accra), as proposed by the OAU Secretary-General, Ide Oumarou.

A report of the OAU's permanent steering committee, elaborating a programme for Africa's economic recovery in the years 1986-90, and incorporating country profiles by joint OAU/Economic Commission for Africa (ECA) missions, was adopted by the Council.

The ministers debated a report by the forty-fifth ordinary session of the Coordinating Committee for the Liberation of Africa, held in Lagos on 27 January 1986, which covered the following points:

- Renewed appeals were made for member-states to settle their arrears to the Liberation Committee's Special Fund, as thirty-two states, together with Morocco, owed a total of \$14m to the fund, as of January 1986.
- On Namibia, the report called on US President Reagan to respect international public opinion by allowing the unconditional implementation of UN Security Council Resolution 435 of 1978. It also stressed the need for increased financial and material assistance to SWAPO.
- The Council commended the increased resistance to Pretoria within South Africa, since the ANC's call to make apartheid unworkable. The increased military activities of Umkhonto We Sizwe (Spear of the Nation) were also commended.
- The report noted that opponents of sanctions against South Africa, who claimed to favour peaceful change, were willing to apply sanctions where they felt that their interests were served by them, citing US measures against Libya, Nicaragua, Afghanistan and Poland, and Britain's embargo against Argentina. Paradoxically, the report continued, South Africa also favoured sanctions, as was demonstrated by its policy towards Lesotho. Several Council members advocated that Africa apply sanctions against Pretoria, whatever the consequences.

The Council also adopted a report of the OAU Secretary-General on the implications of the repeal of the US Clark Amendment, prohibiting assistance to the Angolan rebel movement, and on the US Bill on sanctions against South Africa. The OAU's twenty-first summit in July 1985 had expressed concern over these two issues.⁸⁴ The consensus in the Council was that a five-member OAU delegation should visit the US in order to mobilise opinion against the US policy of 'constructive engagement' with South Africa. The OAU Chairman, Abdou Diouf, was also mandated to approach the US government, requesting assurances against future US military support for destabilising forces in Angola.

The Council adopted other resolutions appealing for increased emergency and rehabilitation assistance for refugees and returnees in Africa; suggesting further expert studies on using the maritime resources of Africa's exclusive zone; calling for further Afro-Arab cooperation; and criticising the French government for its indifference towards negotiations with the OAU *ad hoc* seven-member committee on the issue of reuniting the island of Mayotte (presently under French administration) with the Islamic Republic of Comoros.⁸⁵

The forty-fourth Council meeting was scheduled for Addis Ababa on 21-25 July 1986, and the OAU summit for 28-30 July 1986.

- We have clearly declared our support for Libya in this conflict. We call on both

North-South Monitor

sides, the US and Libya, to exercise restraint in this unprecedented, untimely and dangerous conflict.' Ide Oumarou, OAU Secretary-General, on the US-Libyan dispute. *International Herald Tribune* (Paris) 27 February 1986.

'The OAU has so far not settled a single conflict and it would be a miracle if it could resolve the question of Libyan aggression.' President Hissène Habré of Chad, speaking on the conflict in Chad. *Financial Times* (London) 5 March 1986.

▲ Intergovernmental Authority for Drought and Development (IGADD)

First Summit

Djibouti 15-16 January 1986

■ Leaders of six countries in eastern Africa (Djibouti, Ethiopia, Kenya, Somalia, Sudan and Uganda) adopted an agreement establishing IGADD, and expressed their determination to cooperate in combating drought and desertification in the sub-region, and in fostering development.

The first IGADD summit followed preparatory expert and ministerial meetings in Djibouti in February, May and November 1985. It was addressed by President Abdou Diouf of Senegal, the OAU Chairman, who was attending as an observer (along with representatives from the UN and other international organisations). He reviewed the devastating effects of successive droughts on Africa, and their crippling effect on African economies, which combined with huge foreign debts to retard the continent's development. Calling on the participants to help IGADD reach its objectives—the coordination of programmes against drought and desertification and of development efforts, in short- and medium-term plans—he cited the need for emphasis on food production and on regional cooperation.

The authority, as stated in a final communiqué,⁸⁶ was to consist of an assembly of heads of state and government, a council of ministers and an executive secretariat, based in Djibouti. A plan of action for IGADD was adopted at the summit, identifying emergency measures for immediate implementation, and priorities for strategies for development and for halting environmental degradation. IGADD was to be responsible for arranging short-term emergency aid for drought victims, as well as for coordinating research, including the development of an early-warning system against drought.

President Hasan Gouled Aptidon of Djibouti was elected Chairman of IGADD till 1987, with Mekonen Kibret, Head of Public Relations in the Ethiopian Ministry of Agriculture, to become Secretary-General.⁸⁷

▲ Southern African Development Coordination Conference (SADCC)

Annual Consultative Conference

Harare, 30-31 January 1986

■ SADCC's annual conference was attended by over 450 delegates. They included ministers from the nine SADCC countries (Angola, Botswana, Lesotho, Malawi, Mozambique, Swaziland, Tanzania, Zambia and Zimbabwe), as well as participants from thirty-seven donor countries, including, for the first time, Eastern European countries. Twenty-five international organisations were also represented, as were Southern African liberation movements, such as the African National Congress

North-South Monitor

(ANC), South West Africa People's Organisation (SWAPO) and the Pan-Africanist Congress (PAC).

The conference met to review progress since SADCC's inception in 1980, towards its goal of securing economic independence from South Africa for its nine member-states. Modest progress towards independence was noted, particularly in the fields of agriculture, small energy projects, trade, transport and telecommunications. South Africa itself remained the chief obstacle to further progress, notably through its policy of destabilising neighbouring countries, costing them, in SADCC's estimate, \$10bn over the past five years. The opening session of the meeting was marked by criticism not only of South Africa, but of Western countries, for their limited support for the frontline states and allowing investment in South Africa to continue by refusing to apply stringent economic sanctions. Zimbabwe's Prime Minister, Robert Mugabe, appealed in his opening speech for the imposition by the international community of economic sanctions against Pretoria, whose 'naked aggression' had, he said, shackled its neighbours in economic dependence. Michael Sefali, the Minister of Economic Planning and Finance of Lesotho, following its coup of the previous week, criticised South African apartheid, declaring that Lesotho would not bow to South African pressure. Lesotho remained committed, he said, to a policy of accepting refugees from political persecution in South Africa. Regarding the goal of food self-sufficiency in the region, the conference noted that despite the improved rains since the 1982-4 drought, Angola, Botswana and Mozambique had still not fully recovered.

Noting that only \$4.1bn of the \$8bn needed to implement SADCC's existing projects had been received, the organisation's Executive Secretary, Dr Simba Makoumi appealed for increased financial assistance. The World Bank Vice-President for the Eastern and Southern Africa Office said that the Bank would fund twenty projects per year for the next two to three years, raising its annual commitment to SADCC to \$500m. He said that the Bank would lend an additional \$300m from its Special Facility for Africa to help African countries reconstruct their economies. EEC Director-General for Development, Dieter Frisch, signed a \$165m agreement with Dr Makoumi, to provide aid to promote transport, communication, food security, and human resource development among ACP countries (which include all of SADCC's members). The funds were to be distributed during 1986-9, under Lomé III. Other pledges were made by Canada, Britain, Italy and West Germany. SADCC also signed a joint declaration with the five Nordic countries, to identify priority areas for expanded cooperation between two regions. The banking and commercial sectors, the secretariat and sectoral coordination units were to be strengthened, and inter-regional trade promoted.

The conference closed with a strong condemnation of the welcome provided by the Reagan Administration for Jonas Savimbi, the leader of the UNITA rebel movement in Angola which, according to Botswana's Vice-President and Chairman of SADCC, Peter Mmusi, ran counter to the US's professions of friendship and cooperation with SADCC states.⁸⁸

● 'We do not know how much it costs South Africa to inflict this damage on us but we know that its abilities to carry the cost are underpinned by its economic relations with the rest of the world.' Peter Mmusi, Vice-President of Botswana and Chairman

North-South Monitor

- ⁴¹ On the first day of the meeting, Britain held its first formal direct talks with representatives of the African National Congress (ANC). The meeting, a departure from the previous British policy of refusing to talk to groups which were considered to have advocated violence, was sanctioned by Sir Geoffrey Howe. John Johnstone, the Assistant Under Secretary at the British Foreign and Commonwealth Office, met Thabo Makatini, the ANC Information and Publicity Secretary; Johnstone Makatini, ANC Secretary for External Affairs; and Pallo Jordan, ANC Deputy Director of Information. The British representative was understood to have expressed concern at the escalating violence in South Africa.

- ⁷⁸ The Nicaraguan and Costa Rican deputy foreign ministers, together with the foreign ministers of the Contadora Group, decided at their 12 March meeting that civilian inspectors and security advisers would come from Contadora countries. About ten members and staff of the commission would be based along the frontier. Contadora and other countries would be asked to provide financial assistance, and technical advice and equipment. The agreement reached in San José had yet to be ratified by the Costa Rican Parliament before becoming effective. *T* 14 March 1986.

Third World Foundation News

*Each year, in addition to the publication of **Third World Quarterly** and the annual **Third World Affairs**, the Third World Foundation initiates and encourages a range of activities in its capacity as a forum for research, debate and independent publishing. These activities are linked by the common thread of their contribution to the aims of the Foundation: To work for the intellectual, economic and social advancement of the people of the Third World; to assist in the evolution of a fundamentally just and equitable relationship between the Third World and the developed countries; and to create awareness of the causes of poverty in the Third World.*

South-South Summits and Regional Conferences

South-South I: Strategies of Development, Negotiations and Cooperation. The Foundation and the Chinese Academy of Social Sciences co-sponsored a Third World Summit of Scholars and Statesmen in Beijing in April 1983. The papers delivered at the conference, together with the inaugural address by Mr Zhao Ziyang, Prime Minister of the People's Republic of China, are collected in *The Rich and the Poor* (London: Third World Foundation, 1983). The Conference decided that Beijing '83 would be the first in a series of regular consultations between Third World scholars, held every three years in different Third World capitals, until the goals of the Third World in equitable development, open negotiations and international cooperation had been met. The intervening period would be used for a thorough examination of specific regional issues and problems.

The Role of Regional Integration in the Present World Economic Crisis, the first regional conference under the Beijing programme, was co-sponsored by the Foundation and the National University of Colombia, and held in Cartagena in February 1984. The inaugural address by Dr Belisario Betancur, President of the Republic of Colombia, and the conference papers, are contained in *Regional Integration: The Latin American Experience* (London: Third World Foundation, 1985).

South-South Cooperation: Experiences and Prospects, the second regional conference, co-sponsored by the Foundation and the University of Zimbabwe, was held in Harare in November 1985. The Harare papers, together with the inaugural address delivered by Mr Robert Mugabe, Prime Minister of the Republic of Zimbabwe, form part of *Linking the South: The Route to Economic Cooperation* (London: Third World Foundation, 1986).

South-South II: Charting The Way Forward. The Foundation, in cooperation with the Institute of Strategic and International Studies, Malaysia, organised the Second Summit of Third World Scholars and Statesmen in Kuala Lumpur in May 1986, under the Chairmanship of Dr Mahathir Mohamad, Prime Minister of Malaysia. The conference papers will be published later this year by the Foundation.

Other Conferences and Seminars

Back to the Barracks. The Foundation, in cooperation with the Institute of Commonwealth Studies, London, organised a seminar on the return to civilian rule in developing countries, at Windsor, England, in June 1984. The seminar papers were published in the January 1985 issue of *Third World Quarterly*.

The Third World: A Twenty-five Year Retrospective and Prospective. The Foundation and the Center for International Studies at Duke University, Durham, North Carolina, co-sponsored an international convocation at Duke University in February 1985, whose focal issues were development priorities, authoritarianism and military rule and international debt. The keynote address, delivered by Sir Shridath Ramphal, Secretary-General of the Commonwealth Secretariat, is included in *Third World Affairs 1986*.

Survival in the Nuclear Age. To mark the Fortieth Anniversary of the commencement of the San Francisco Conference 1945, that led to the establishment of the United Nations, the Foundation and Parliamentarians for World Order co-sponsored a symposium in New York in April 1985. It was presided over by Mr Willy Brandt, former Chancellor of the Federal Republic of Germany. The Final Statement of the symposium, which subsequently formed part of the proceedings of the UN Conference on Disarmament, Geneva, is included in *Third World Affairs 1986*, together with papers delivered at the symposium.

The Transition to Democracy in the Third World. In cooperation with the University of Buenos Aires, the Foundation convened a conference in Buenos Aires in August 1985, to discuss the growing trend of re-democratisation in developing countries and the withdrawal of the military from political power. The inaugural address, delivered by Dr Raúl Alfonsín, President of the Republic of Argentina, was published in the January 1986 issue of *Third World Quarterly*.

Third World Prize

The 1985 Third World Prize was awarded jointly to Nelson Rolihlahla Mandela and Nomzamo Winnie Mandela. It was presented in Kuala Lumpur by Dr Mahathir Mohamad, Prime Minister of Malaysia.

Previous recipients of the Third World Prize of \$100,000, conferred on individuals and institutions for outstanding contributions to Third World development in the economic, social, political and scientific fields, have been: 1980 Dr Raúl Prebisch, the Argentinian economist: presented in New York by Sir Shridath Ramphal. The Guest of Honour was Dr Kurt Waldheim, Secretary-General of the United Nations.

- 1981 Dr Julius Nyerere, President of the United Republic of Tanzania: presented in New Delhi by the late Mrs Indira Gandhi, Prime Minister of India.
- 1982 The International Rice Research Institute, Manila, the Philippines: presented in Beijing to the Institute's Director-General, Dr M S Swaminathan by Mr Zhou Ziyang, Prime Minister of the People's Republic of China.
- 1983 Dr Arvid Pardo, Professor of International Relations and Senior Research Fellow at the Institute of Marine and Coastal Studies of the University of California, Los Angeles: presented in Cartagena by President Belisario Betancur of Colombia.
- 1984 Mr Willy Brandt, former Chancellor of the Federal Republic of Germany: presented in New York by Sir Shridath Ramphal. The Guest of Honour was Mr Javier Pérez de Cuellar, Secretary-General of the United Nations.

Third World Lecture

The Foundation organises the annual Third World Lecture, usually delivered by the Third World Prize winner or a nominated representative.

Peace and Development, the sixth Third World Lecture, was delivered in New York in 1985 by Mr Willy Brandt. The Lecture is published in *Third World Affairs* 1986.

Previous Third World Lectures have been:

- 1979 *The Politics of Affirmation*: delivered in London by Mr Michael Manley, then Prime Minister of Jamaica.
- 1981 *The Crisis of Capitalism*: delivered in New York by Dr Raúl Prebisch.
- 1982 *South-South Option*: delivered in New Delhi by President Julius Nyerere.
- 1983 *Agricultural Progress—Key to Third World Prosperity*: delivered in Beijing by Dr M S Swaminathan.
- 1984 *Ocean Space and Mankind*: delivered in Cartagena, Colombia, by Dr Arvid Pardo.

Manzur Qadir Memorial Lecture

The Foundation, in collaboration with the Manzur Qadir Memorial Society, Lahore, has instituted an annual lecture in Pakistan, in recognition of the contribution made by the late Mr Manzur Qadir to upholding the supremacy of the Rule of Law. Each lecture concerns a subject likely to contribute to the enhancement of human rights and freedoms.

The Right to Food: The Relevance of Human Rights to World Hunger, the first Manzur Qadir Memorial Lecture, was delivered in Lahore in December 1985 by Dr Philip Alston, Associate Professor at the Fletcher School of Law and Diplomacy, Boston, and Visiting Professor at Harvard Law School. The text of the Lecture is available from Third World Foundation, price £3.00.

STUDIES IN COMPARATIVE INTERNATIONAL DEVELOPMENT

STUDIES IN COMPARATIVE INTERNATIONAL DEVELOPMENT is an interdisciplinary social science journal, published quarterly, exploring current issues in development theory and practice. For twenty years the journal has analyzed social and cultural change, remaining open to all theoretical, methodological, and ideological approaches. SCID examines the great and sometimes growing differences between societies within each of the three worlds of development, and stimulates the scholarly exchange of views and research findings on the critical and complex relationship between population, technology, and policy in a developmental context.

Articles of enduring interest already published on:

SOCIAL STRUCTURE AND STRATIFICATION • Kwang Chung Kim examines the recruitment of college-educated employees in Korea • Scott Menard explores the ties between fertility, development, and family planning • Julie Fisher on neighborhood improvement associations in the Latin American squatter settlements.

RURAL/URBAN DICHOTOMIES • John W. Bennett examines agricultural cooperatives in the development process • Douglas Barnes and Reeve Vanneman on agricultural development and rural landlessness in India.

DEVELOPMENT POLITICS • John D. Martz investigates populist leadership and the Party Caudillo • John W. Sloan compares public policy in Cuba and Brazil • James Levy and Nick D. Mills, Jr. look at the challenge to democratic reformism in Ecuador.

MILITARISM IN THE THIRD WORLD • Irving Louis Horowitz, Claude E. Welch, Jr., and Augustus Richard Norton review militarization and consolidation in the Third World.

DEVELOPMENT ECONOMICS • Steven B. Butler discusses field research in China's communes • Michael Painter analyzes the political economy of food production in Peru • Douglas K. Midgett on the resuscitation of the Antiguan sugar industry.

DEVELOPMENT PLANNING AND POLICY • Edmond J. Keller evaluates the Harambee School Movement in Kenya • Omar Davies discusses policy issues of economic transformation in Jamaica • Aldo Ferrer on the problems and prospects of the Latin American foreign debt.

Jay Weinstein (*Georgia Institute of Technology*) is editor of SCID. Members of the editorial board include: C.M. Abraham (*Madras University*), Aldo Ferrer (*Buenos Aires*), Wolf Grabendorff (*Research Institute for International Affairs, Eberhardshausen*), Bernard Karsh (*University of Illinois*), Melvin Kranzberg (*Georgia Institute of Technology*), Rene Lemarchand (*University of Florida*), Hiroshi Mannari (*Kyushu Gakuin University, Japan*), Michael L. McNulty (*University of Iowa*), Olga Pellicer de Brody (*El Colegio de Mexico*), V.S. Prakash Rao (*Indian Institute of Management, Bangalore*), C.N. Ramu (*University of Manitoba*), Riordan Roett (*Johns Hopkins University*), Gerard Rushton (*University of Iowa*), Glaucio A.D. Soares (*University of Florida*), and Richard Weiskopf (*Florida State University*).

Published quarterly. Founded 1964

Subscription rates: Individuals \$30/yr, \$50/2 yr, \$70/3 yr; Institutions \$40/yr, \$67/2 yr, \$92/3 yr. Domestic first class add \$6/yr. Outside the USA add \$5/yr surface mail, \$15/yr airmail. Single copies: \$12 each. ISSN 0039-3006

Edited by David E Hojman

Liverpool: Centre for Latin American Studies, University of Liverpool. 1985. 151pp. £5.50pb

'Old soldiers never die', runs the refrain of *The War Song of the British Soldiers, 1914-18* (anonymous writer), 'they only fade away'. This is not entirely true of the historical and political experience of countries with a strong democratic tradition and where the services have generally been subordinate to the civil power, countries which have seen successful military commanders subsequently become—usually through elections—heads of state. But, the Washingtons, Wellingtons, de Gaulles or Eisenhowers are comparatively rare. And they do not preside over military regimes. Their martial exploits, a key factor in their political success initially, fade away in their new profession. In Latin America, however, service commanders who govern nations and then cease to do so, have a striking historical habit of hanging around like ghosts or, much more commonly, being reincarnated. In short, military intervention in the political, economic and social spheres in that continent is not an unusual phenomenon but a commonplace. And, while, obviously, there are exceptions, they tend to prove the rule. The fact that, in the mid-1980s, most countries in Latin America have elected civilian governments is no guarantee

BOOK REVIEWS

at all that democracy will endure, for in so many states the role of the services in the national life has been as constant a feature of the landscape as the Andes and the Amazon.

And that has little or nothing to do with professional service success, at least since the Wars of Independence at the beginning of the nineteenth century, not only because there have been comparatively few wars *between* states, where reputations might have been made, but also because the armed forces' position in state and society is a crucial part of the warp and woof of Latin American history. Philip (p 1) is largely, though not entirely, correct in saying that 'serious study of the political role of the Latin American military dates back only to the 1960s'. It is certainly true that the volume of serious work on the subject increased rapidly from that decade and is now enormous. But historians have long been aware of the significance of the military in the evolution of the Latin American states, since their role was built into it from the time of the *conquistadores*, underlined by problems of imperial defence for over three hundred years, accentuated by the wars of independence, and emphasised by the vacuum of political legitimacy those wars themselves created in destroying imperial authority, thus making the struggle for power competitive. In Latin America, the man on horseback has always been around and historians have always known this.

Yet, while a number of historians have made distinguished contributions to the debate on the military in Latin America—and it would be invidious to name names, and tedious to present a bibliography here—they have generally been chary of theorising about the subject, reluctant to make comparisons, build models and construct schema. It is the nature of the historian's discipline to be particular rather than general. Other social scientists have filled that gap, enlarging discussion and provoking debate. It is only a slight exaggeration to say that most of the vast bibliography on the Latin American military which has emerged in the past twenty years or so has been derived from the impact of scholars who have not been afraid to put forward *general* propositions from particular cases. (For a succinct 'overview' of this development—and much else besides—see Arturo Valenzuela's article, 'The military and social science theory', *Third World Quarterly* 7(1) January 1985, pp 132–43.

Of the four books reviewed here, only the essays in Hojman do not strikingly reflect the indebtedness of their authors (and editors, where that description applies) to such thought-provoking 'models' as S E Finer's, *The Man on Horseback* (1962)—a pioneer work; Samuel Huntington's, *Political Order in Changing Societies* (1968), and Guillermo O'Donnell's, *Modernization and Bureaucratic-Authoritarianism: Studies in South American Politics* (1973). Lack of space here prevents a more detailed summary than that presented, but readers unfamiliar with the literature should consult Valenzuela (*op. cit.*). He, referring to the rise of military regimes from the 1960s which, in Latin America, reached their apogee in the 1970s—in Argentina, Brazil, Chile, Peru, Bolivia

and Uruguay—describes the striking advances in social science interpretations of military governments. He says:

This literature sought to comprehend, rather than pass judgement on, complex political phenomena such as military rule. It dismissed works, primarily by historians, as naive for their condemnation of 'ruthless' military leaders on the assumption that the curbing of predatory militarism would lead to a strengthening of liberal institutions . . . the revisionists held that military activity had to be understood as the result of basic societal imbalances which could only be corrected by changes in the underlying system (*op. cit.*, p 133)

The 'classic' works mentioned above are obligatory reference points for almost all subsequent writers, and it is significant that both Philip in his introductory chapters, and Cammack, in the first essay in the book he co-edited, spend a good deal of time considering them and, in part, refuting them. This is particularly true of O'Donnell's work—which he himself subsequently refined—and, summarily stated by Caviedes (p 135), 'that bureaucratic authoritarian regimes develop as a consequence of increased capitalist dependency, and that they must necessarily be anti-socialist in character and dominated by oligarchic elites', elites which he dissects. There is, then, a coalition of interests between those economic and political elites and the military when both feel their interests threatened on whatever grounds—ideological, economic, security, social change—under civilian governments. Military intervention, in its very different forms in the separate states, occurs against a common background. The question is: how, and when can it be liquidated? And what factors promote that development?

The four books reviewed here have the benefit of hindsight. They were published or, at least, written in one of those cyclical periods in Latin American history when long-standing military governments were giving way to civilian ones. In the early 1980s, we have seen Brazil's twenty-year old military government get out; Uruguay's ten-year uniformed regime give up and, in the aftermath of Argentina's débâcle in the Falklands war, military government there so discredited that a return to competitive, party politics was quite inevitable. The same cycle had already affected, or was affecting, Bolivia, Ecuador and Peru in South America, and a similar domino effect was recently seen in Central America. In South America itself today, only President (and General) Augusto Pinochet in Chile, and President (and General) Alfredo Stroessner in Paraguay survive as the (very) personal representatives of types of government democrats find abhorrent. And, clearly, the biggest element undermining the military who have gone—apart, perhaps, from Argentina though it was important there, too—was comparative economic failure or, rather, an inability to deliver what was expected, particularly by their middle and upper class allies, despite, as in Brazil and Chile, some euphoric years. Other factors were political and personal repression, leading to more vociferous opposition and a growing sense of misgiving among the military themselves.

But, we have been here before. Although the return to democracy is to be applauded, it should be recalled that, in the early 1960s, democracy was the rule rather than the exception, yet, within a few years, it was exactly the other way round. This is a generalisation and, as Dumas once remarked: 'All generalisations are suspect, including that one'. This is to say that, while certain Latin American states—notably Colombia, Costa Rica, Mexico (with some qualifications) and Venezuela—seem to have created viable democratic institutions and defused the possibility of military intervention in politics, most others have not yet done so. Moreover, it is salutary to recall that, in the early 1970s, we saw the aberration of the two most long-standing democratic countries of South America—Uruguay and Chile—succumb to military rule. The one has now been dismantled (after ten years), the other persists (after almost thirteen). And, in present world and regional economic circumstances, are the democracies immune? (Costa Rica, having no army, has probably had the best vaccine).

Such a scenario suggests that we should be talking more about contrasts than comparisons, while recognising the utility of 'models', and these four books appreciate the need for that balance. They all relate, explicitly, to these wider propositions and are useful contributions, though they are very different in character. Two of them—Hojman, and O'Brien and Cammack—are collective enterprises. The first evolved from a workshop in September 1983, at the University of Liverpool's Centre for Latin American Studies, to mark (commemorate or celebrate would hardly be appropriate words) the tenth anniversary of the military coup in Chile; the second resulted from a symposium organised by the editors for the forty-fourth International Congress of Americanists, held at Manchester in September 1982. The books by Philip and Caviedes are individual monographs. Obviously, since all four treat of similar, or related, material, they overlap: this is particularly true on the economic side. O'Brien and Cammack, indeed, regard—as their subtitle says—'the crisis of military rule in Latin America' as being essentially an economic one, and the individual essays, on Argentina (by William C Smith), Uruguay (Henry Finch), Brazil (Thomas E Skidmore) and Chile (Philip O'Brien), together with Paul Cammack's broad introductory essay and the editors' conclusion, are probably the best analysis of the apparent failure of the military governments in those countries to do better than civilian counterparts in tackling deep-seated economic and social issues. All the chapters are well-researched and persuasive, though, sometimes, language gets in the way: eg the introductory essay, in parts at least, has to be read twice over by the simple searcher after truth not accustomed to social science semaphore. ('In broad terms the issue is a familiar one, polarised in the choice between nomothetic and ideographic approaches: what it comes down to in practice is whether one should respect the internal logic and the coherence of the cases chosen for study or seek to draw selectively upon cases in order to produce a

model with a logic of its own' [p 13]. The issue might be made *more* familiar if one observed the dictum of Sir Samuel Garth, that there is such a thing as 'a barren superfluity of words'. But the fact that, here, we sometimes have it does not detract from a thoughtful and constructive series of case studies, set against the 'model' approaches of other writers on the theme. They achieve that balance which the preface spells out: 'Our purpose is to raise issues which are to be considered in the light of internally coherent accounts of individual national experiences, rather than to abstract out of them another general model which destroys the logic of the individual cases in order to construct one of its own'. (p vii). And, on the whole, they succeed.

The Hojman book reflects its origins as a random collection of papers which most academic workshops produce, and its sub-title is well-chosen. That 'Chilean song since 1973: an overview' (Catherine Boyle) is one element 'for the analysis of military rule' in Chile is, no doubt, true, and the essay is an interesting one, but it represents more a reaction to military behaviour than what actually conditions the latter. The other 'elements' are concerned with 'The Southern Cone model' (Laurence Whitehead); 'The current economic situation' (Lucy Blackburn)—a concise appraisal; 'The Church' (Hernan Rosenkranz); 'Agrarian change' (Cristobal Kay); 'Debt' (Luis Kaffman) and the editor himself, 'A quarterly econometric model of Chile, 1974-1979'. These are useful little essays—though duplicating much of what has appeared *in extenso* elsewhere—which, no doubt, will be incorporated into grander designs later.

Philip, who had written substantial works already on the Latin American military (notably Peru), provides in his book one of the best overall accounts, the result not only of detailed research but also of an encyclopaedic knowledge of the vast secondary literature. As a political scientist, politics must be his priority, but he does not neglect the fact that the boundary between political analysis and historical research in the study of institutions—such as the armed services—is rather blurred. In a number of chapters, he puts the Latin American military into clear historical perspective, and this is essential in seeking to understand them as institutions and to recognise their relations with the wider society to which they belong and their perceptions of it. Unfortunately, although the author is both learned and literate, he has not been well-served by his publisher: accents on Spanish and Portuguese names seem to have been entered (or, usually, omitted) in as arbitrary a manner as the military themselves often behave, and the close-knit type is abominable. If 'the medium is the message', this book is a mess but the cost of damage to the reader's eyesight has its compensation in its content and reflection.

In many respects, however, and certainly for the non-specialist, the book by Caviedes makes the best reading, primarily because he approaches the problem from a quite different standpoint. As a geographer, but with a multi-disciplinary approach, he emphasises—as the others do not—two critical

elements in the analysis: the geographical and geopolitical environment in which military regimes operate, and the social *ambience* in which they live and move. In this connection, it may be instructive to reflect on the facts that the earlier career of Chile's Pinochet was as an instructor in geopolitics at the Chilean Military School (cf his *Geopolítica: diferentes etapas para el geopolítico de los estados*, 1968) and that he also compiled ('wrote' would be too flattering a word) a *Síntesis Geográfica de la República de Chile* (undated) for military instruction. This covers not only Chile, despite its title, but also her neighbours, Argentina, Bolivia and Peru, natural preoccupations for a professional soldier, charged, *inter alia*, with the defence of sovereign territory against the possible pretensions and revanchist sentiments of contiguous countries. The book, moreover, is dedicated to 'the Military School of Chile, nursery of the traditions which form the soul of the officer corps of our army'. It is my guess—as an historian—that one can understand more about Pinochet by reading *Vigilia de armas* of Captain Tobías Barros Ortíz (1st edn, 1920) which he must have read and digested. That book is a paean of praise for the military profession as such, since the latter represents patriotism, sacrifice, discipline and order, qualities not always found, according to Barros, in civilians. Many of Pinochet's speeches—and he makes a lot—are the clearest echoes of Barros, though the environment has changed a bit with the contemporary 'Communist menace' to Chile which Pinochet has perceived since the time of Allende, if not before. But, although circumstances may be different, the arguments are more or less the same. In seeking to understand the Latin American military, there seems to me to be more in this in terms of historical and institutional continuity than in 'models', econometric or otherwise.

Though Caviedes does not mention Barros in either his text or his bibliography, his work is full of insights because he draws on a wide canvas—geographical, historical, social and economic. The other books are more narrowly based, and his is the best one for the layman.

In the conclusion to his article, Arturo Valenzuela declares: 'The irony is that studies of the military would profit more by turning to the traditional and more hortatory literature on the military, rather than drawing their inspiration from the "scientific" studies of the 1960s'. (*op. cit.*, p 143). There is a lot in this, and it comes through the pages of Philip, O'Brien and Cammack, and Caviedes, all of whom react, in different degrees, against those 'scientific' studies. Perhaps this means that the historian has his uses, after all. For example, few students of the military have actually concentrated on what the military in Latin America themselves have thought and said about themselves—their self-perceptions, psychologists might say. An exception is Frederick Nunn who, in his substantial books and articles, (eg, *The Military in Chilean History: Essays on Civil-Military Relations, 1810-1973* (1976) and *Yesterday's Soldiers: European Military Professionalism in South America, 1890-1940* (1983)) shows how a close study of service journals, coupled with

personal interviews with military personnel, provides very solid data on institutional structure, military ideologies and, perhaps, most important, the strength of continuities to be weighed against actual contingencies. The 'model-builder' has his place, for sure, though what he builds depends on a lot of brick-makers, among whom historians have a rather significant place. And, perhaps, the psychologist should be recruited, too. In the study of the Latin American military, there is an axiom of Goethe which might profitably be borne in mind: 'All theory is grey', he said, and he was right.

Bridging the South

Regional Integration: The Latin American Experience

Edited by Altaf Gauhar

London: Third World Foundation. 1985. 282pp. £16.00

Perhaps the most recurrent topic in the recent history of Latin American economic development is that of regional integration. After the slow-down of Latin American economic growth in the post-war era and the increasing trade difficulties encountered by the countries therein, regional economic integration came to be considered an important and viable means to accelerate economic development. Many hopes were pinned on integration in the 1960s. Basing itself on Western Europe's model of free trade, the UN Economic Commission for Latin America (ECLA) proposed regional economic integration as a mechanism that would stimulate the Latin American economies by encouraging import-substitution and the specialised production of goods within a protected regional market.

However, more than a decade later, the creation of specialised institutions for that purpose, and a lot of rhetoric on the subject, substantial advances in the direction of creating a free trade zone in Latin America were still to be made. The explanations for the lack of success of integration efforts in Latin America are well known: the disparate levels of industrialisation and resource endowment, the varying sizes of the internal markets plus the different nature and orientations of the political regimes in the countries of the region. Apart from these obstacles, traditional rivalries and hostilities between some Latin America countries have added up to the difficulties of achieving a more integrated economic system. This led to a gradual loss of interest in the process.

Regional economic integration in Latin America, considered by many as an outdated subject and an unviable strategy for accelerating economic

development in Latin America, has received a renewed impetus. Indeed, the recent economic and financial crisis which most of the countries in Latin America are experiencing, with the consequent negative effects on the ability to import and the over-riding need to export to service a huge foreign debt, have led to a re-evaluation of the old model of economic integration. But also, and perhaps more importantly, a new sense of regional identity has emerged out of the sharing of similar economic problems and the same external constraints. The Latin American leaders have come to realise the importance of strengthening the economic (and political) links between the countries of the region.

In the light of these considerations the publication of the present book is most timely. It consists of a collection of articles which were presented at a Third World Foundation Conference which took place in Cartagena, Colombia, in 1984. This conference, the third in a series of South-South meetings, gathered delegates from Latin America, Africa, Asia and the Caribbean to assess the future of economic integration in Latin America.

Although not formally structured, the book can roughly be divided into three parts. The first four chapters set up the framework of analysis: three of them concentrate on the causes of the present international economic crisis and its effects on Latin American development and a fourth one is devoted specifically to the debt problem and its implications for the future economic development of the area. The second part of the book introduces the subject of integration proper, with one chapter dealing with the political aspects of Latin American cooperation and two general ones on the process of economic integration, how it has performed so far and the obstacles which prevent this process from advancing. Three specific case studies are presented: the Central American Common Market (CACM), the Caribbean Community and Common Market (CARICOM) and the Andean Pact. The last part of the book, consisting of the last three chapters, touches on slightly different but related topics: trade, protectionism and debt; the failure of the formal integration process in Latin America and the emerging new forms of cooperation; and the role the universities have played in increasing cooperation and communications within Latin America through academic links. A concluding chapter is unfortunately missing: the reader would have welcomed some brief remarks highlighting the main points made by the contributors to the volume, whose views on several important topics coincide to a remarkable degree.

The authors of the first three chapters, Osvaldo Sunkel, Enrique Iglesias and Celso Furtado present a similar interpretation of the causes of the current problems faced by the world economy which are at the root of Latin America's huge external debt difficulties. They focus mainly on the fact that during the 1970s the international financial system acquired a markedly private character. A few big banks gradually gained a great freedom of manoeuvre and outgrew

the supervision of the national financial authorities, thereby achieving an almost unchallenged control of the international financial system. This led to 'financial permissiveness' which made it relatively easy for the Latin American countries to borrow unprecedented amounts from private commercial banks in order to keep growing at relatively high rates when the industrial centres were undergoing a pronounced recession. Though the three authors would agree that the responsibility for the present situation is shared by the transnational banks and the governments of both the industrial nations and the Latin American countries, the analyses mostly concentrate on the actions and omissions of the first two. They are written in the best ECLA tradition: the stress on the importance of economic developments in the centres and their negative impact on the periphery. It is surprising to find this style of analysis (so much in vogue more than a decade ago) still favoured by these authors, although perhaps less so considering that Sunkel and Iglesias are consultant and former Executive Secretary of ECLA respectively.

The general tone of the book is one of pessimism, in what concerns the present and future situation of the world economy in general and that of the Latin American countries in particular. Also, it contains a gloomy appraisal of the achievements of the integration efforts in the region. The dismal view of the international situation is particularly noticeable in the introductory part. What transpires from it is that a sound economic recovery in the OECD countries cannot be expected given the present circumstances. This will, in turn, affect the Third World by not providing the necessary stimulus for expansion. Sunkel is quite explicit on this. He believes that what the world is facing at present is not a transient era of recession but rather a long-term decline of the world economy. The present slight recovery of the US and other industrial countries will not be sustained and will give way to a more profound structural crisis, to the 'tempestuous close of an expansionist epoch or phase of capitalism' (p 13).

To meet this challenge imposed by external conditions the Latin American countries can have the alternative of choosing new routes and exploring 'new future options'. Though none of the authors go as far as proposing an alternative paradigm for Latin America's future economic development they do point to the need for Latin America to embark on a more equitable and autonomous style of development and they, implicitly and explicitly, state that regional cooperation within Latin America and between Latin American and other Third World countries should play a fundamental role.

Other more concrete suggestions for reducing the region's vulnerability to external shocks, for overcoming the present crisis and for fostering long-term growth are: the creation of a new set of international public institutions; the renegotiation of Latin America's external debt with growth in mind rather than with restrictive economic policies; the redistribution of income within Latin America; the pursuit of expansionist policies in the industrial centres. Though

North-South Monitor

of SADCC, speaking of South Africa's destabilisation of the frontline states. *The Guardian* (London) 31 January 1986.

▲ Mozambique-South Africa
Ministerial Meeting
Maputo, 26 February 1986

■ The South African Minister of Foreign Affairs, Roelof 'Pik' Botha and the Mozambican Minister in the Presidency for Economic Affairs, Jacinto Veloso, met for talks requested by the South African government. Their discussions centred on the Nkomati Accord on Peace and Non-Aggression between the two countries, which South Africa had previously admitted having 'technically' violated.⁸⁹

In a joint statement issued after the meeting, the two sides reported that they had agreed on the importance of the Pact to the peoples of Southern Africa and to peace and stability in the region. Following this reaffirmation of the treaty, it was announced that the two sides had drawn up proposals to strengthen the Accord. 'Pik' Botha was reported to have said after the meeting that the talks focused on ways of investigating violations of the treaty.⁹⁰

▲ Mozambique-Tanzania Joint Commission
Eleventh Session
Dar es Salaam, 9 March 1986

■ The Mozambican delegation to the joint commission was led by Pascoal Mocumbi, Minister of Health, and the Tanzanian by Basil Mramba, Minister for Industries and Trade. In a final joint communiqué, the two countries reiterated their pledge to continue moral and material support to the liberation struggle in Southern Africa. They condemned South African acts of aggression and destabilisation against Mozambique and the other frontline states, and denounced what they termed Pretoria's oppression against the South African and Namibian peoples.

The ministers commended the achievements towards bilateral cooperation achieved during the period from 1985-6, while noting the potential for further cooperation. During the meeting, a cooperation programme was drawn up, which covered agriculture, industry, education, culture, health and information for the 1986-7 period.⁹¹

This Monitor was written and researched for Third World Quarterly by Maya Jaggi.

become standard words. By the end of the book one has a strong feeling of *déjà vu*.

Although there is nothing wrong with the ECLA analysis of the Latin American situation, it does facilitate leaving out certain important pieces of the puzzle: for instance, the structure and characteristics of the Latin American debt (mostly composed of short-term loans at floating exchange rates which were the main cause of an otherwise manageable situation turning into one of difficult solution) are not much taken into consideration. Also, one misses a critical appraisal of the long-term development strategies commonly chosen by the Latin American countries (very much under ECLA guidance) which had a great deal to do with maldistribution of income, inefficient allocation of resources, mismanagement, in short, to Latin America's present quandary. As regards future economic plans for the region, although the general lines are clear, a bit more precision on certain key topics would have been very welcome. The foreign trade implications (regional and extra-regional) of debt servicing could add an interesting dimension and timely debate to discussion: about future development strategies. What are the possibilities of Latin American countries embarking on export-led growth? Would it be desirable? What are the alternatives?

These last criticisms, however, do not detract from the value of this book. Most chapters are well-argued, straightforward and well-written; they contain thoughtful analyses on topics of prime importance. This book is essential reading for those interested in the current trends in Latin American economic thought and the state and prospects of Latin American integration.

Words and hunger

Philip Alston

Ending Hunger: An Idea Whose Time Has Come

The Hunger Project

New York: Praeger. 1985. 430pp. £25.00. £12.95pb

Since its creation in 1977 the Hunger Project has 'enrolled' 3,500,000 people in 152 countries, all of whom are considered to have 'publicly declared their commitment to the end of hunger'. Its stated purpose is to 'generate a global context of individual will and commitment for ending hunger on our planet by the end of the century'. (p 400)

But despite these worthy objectives the Hunger Project has been the subject

of a variety of attacks challenging its sincerity, the motivation of its founders and the usefulness and acceptability of its techniques.¹ Perhaps the most readily verifiable of the allegations made against it is the virtual absence of any practical projects aimed at the alleviation of hunger. The funds raised are used almost entirely for the holding of seminars and briefing sessions and the publication of brochures and newspapers (*A Shift in the Wind*) the main thrust of which is to repeat constantly the slogan that ending hunger is an idea whose time has come.

The publication of this book thus represents a major effort by the Hunger Project to establish its *bona fides* and to demonstrate that the funds which it raises are being put to good use. The coffee table-sized book is magnificently produced. In format it is a mix between the *National Geographic Magazine* and the World Bank's annual *World Development Report*. The colour photography, which takes up almost half of it, is superb. Its text is divided up into chapters dealing with the basic facts, population, food, foreign aid, national security, the New International Economic Order (NIEO) and success stories in the fight against hunger (Taiwan, China, Sri Lanka are highlighted).

The book has a veritable cast of thousands. In addition to the 250 or so who are listed as having been directly involved in researching, writing, editing, reviewing and producing the publication, there is an excruciatingly self-conscious effort to quote every conceivable authority on the issues at hand. Those whose opinions are reflected range from Walter Rodney, Susan George, Frances Moore Lappé, Mao Tse-tung, Henry Kissinger, Peter Bauer, Pope Paul VI and the Heritage Foundation. The result is a confusing pot-pourri of often diametrically opposed viewpoints, each of which is assumed to have a degree of validity but none of which is presented in sufficient detail to enable readers to reach a reasoned conclusion for themselves.

Thus, for example, the chapter dealing with the NIEO presents the views of 'representatives' of what are said to be the two main schools of thought on the subject. The first considers that 'to promote development and to end hunger and poverty a (NIEO) must be established in place of the current international economic order'. By contrast, according to the second school, 'the present economic order is working well—if anything, it needs to be strengthened. The proposals for a (NIEO) are based on false premises, are impractical and are potentially dangerous'. The book accords the thoughts of the second school almost double the space of the first. The chapter concludes, characteristically, that the debate 'provides a valuable resource for ending hunger'.

This attempt to achieve an impartial, apolitical treatment of controversial issues is typical of the approach of the entire book and indeed of the work of the Hunger Project as a whole. Its rationale can only be understood in the light of the organisation's origins. It was founded by Werner Erhardt who continues to

¹ See, for example, *The New Internationalist*, June 1985, pp 14–15 and 28.

be on its Board of Directors and who contributed some of the funds for the production of the book under review. Erhardt is described (p 401) as the 'originator of a technology of transformation' and the 'founder of an international network of individuals, organisations, and foundations carrying out the work of individual and social transformation'. He is best known as the creator of EST (Erhardt Seminar Training) whose message of individual empowerment through self-awareness is effectively carried over into the Hunger Project.

Thus the dust-jacket of the book promises that:

In its pages you will discover ways of interacting with hunger and other global issues that can lead to real solutions rather than more debate and controversy. You will see how to understand and effectively use information that seems contradictory and confusing. You will be empowered to hold and reconcile divergent viewpoints so that their differences support, rather than obstruct, you in arriving at a solution. You will learn principles for action through which vision and intention can be turned into reality.

The problem is that such touching faith in the power of individual enlightenment serves to mask a persistent refusal to take a stand on any of the fundamental issues which lie at the heart of the problem of world hunger. The organisation's 'guidelines for enrolling others in the Hunger Project' counsel that 'when people resist or argue, don't resist or try to move them off their position. Make it clear that the context of the end of hunger and starvation by 1997 holds all positions, even ones that say it can't be done'.² It is almost as though a group dedicated to the promotion of peace in 1940 was not prepared to differentiate between Hitler and Roosevelt or Mussolini and Churchill. It would simply repeat over and over that peace is possible and then reproduce excerpts from the speeches of each of the relevant leaders.

In the area of hunger there *are* demonstrably harmful practices; there *are* instances of unconscionable failures to act on the part of governments and other actors; and there *are* solutions which deserve to be championed. The Hunger Project's total ambivalence leads inevitably to a prescriptive paralysis which in the end can only be used to justify the status quo. Reacting against such approaches a recent report on Hunger in America concluded that 'it is time to end the contrived befuddlement of some who wring their hands wondering what to do about hunger'.³

On the technical level, the book tends to over-simplify almost all of the issues with which it deals. For example, by taking an infant mortality rate of below 50 deaths per thousand as a definitive indicator of a society's success in eradicating hunger, the authors conclude that 'since 1900, seventy-five countries have ended hunger within their borders as a basic, society-wide issue'. As a result, the focus of the book is exclusively on the Third World and problems in

² *ibid.*, p 15.

³ Physician Task Force on Hunger in America, *Hunger in America: The Growing Epidemic*. Boston: 1985, p 120. *

countries like the United States are virtually dismissed (only 'pockets of hunger exist', p 386). Yet a recent report by the Harvard University School of Public Health concluded that 'hunger is a problem of epidemic proportions' in the US, affecting up to 20 million individuals.⁴

If lavishly produced books could end world hunger this one could do it. If slogans which are repeated with sufficient frequency could do the trick, the incantation that 'ending hunger is an idea whose time has come' would certainly work. But if tough political decisions and carefully targeted pressures are required, neither the book nor the slogan which it embodies will make much difference to world hunger. It is unfortunately no more than a glossy recipe for inaction supported by the trappings but not the substance of academic analysis.

Power, Passions, and Purpose: Prospects for North-South Negotiations

Edited by Jagdish N Bhagwati and John Gerard Ruggie
Cambridge, Massachusetts: MIT Press. 1984. 338pp. n/p

Shortly before the March 1983 Non-Aligned Summit meeting in New Delhi, a conference of academics and policymakers took place in the Indian capital. Its purpose was to analyse the discouraging state of the Global Negotiations, a major Third World initiative that had issued from the previous Non-Aligned Summit in 1979. After the conference, two participants drafted a policy statement that called upon the non-aligned to cease efforts at 'launching the unlaunchable' and to pursue instead 'medium-term reforms', notably through a proposed International Monetary Conference (pp 325, 327). The Non-Aligned conference proceeded to do just that.

More than most academic colloquia, therefore, the Conference on Global Negotiations appears to have had a significant impact upon governments' decisions. If for no other reason, this volume which contains the main invited papers prepared for that conference would be of considerable interest. The essays, which deal with such issues as debt, trade, the global economic organisations, South-South cooperation and various facets of the politics of North-South bargaining, are in fact all knowledgeable and thoughtful. They contain a host of ideas about what the South ought to be seeking (eg more open trade, more voice in global institutions like the IMF, an expanded compensatory financing facility) in its negotiations with the North. Yet most of these essays do not directly address the issue of whether the Global Negotiations format is the best way to achieve needed change.

This task fell primarily to Jagdish Bhagwati who helped to organise the conference and who co-authored (with Carlos Diaz-Alejandro) the policy paper which appears at the end of the volume. Bhagwati's introductory chapter vehemently argues against the Global Negotiations strategy on the grounds that it is utterly unrealistic. His point is simply that the South lacks the power to induce the North to enter comprehensive negotiations on the global economy. He argues that the 'oil card' has been played out: after a fleeting moment in the 1970s when OPEC's success in raising oil prices did

⁴ *ibid.*, p 4.

enhance Third World bargaining capability, the power configuration has reverted to Northern hegemony. The strategy of Global Negotiations was flawed by the 'sharp disjunction between Southern demands and Southern strength', (p 9) between power and purpose (the passions of the title are mainly found in Bhagwati's contributions). One need not disagree with the proposition that the North is a powerful actor to question whether Bhagwati's tirade against the Global Negotiations as 'a wasteful and counterproductive diversion' (p 14) is not excessive.

John Gerard Ruggie's contribution may have reinforced Bhagwati's pessimism about Third World ability to change the prevailing economic structures. Ruggie draws upon the work of regime theorists to argue that the basic norms of the current liberal regime emphasising market rationality are rooted not only 'in the interstate hegemony of the United States' but also in the characteristic form of state-society relations throughout the advanced capitalist world (p 37). These are structural determinants that are difficult to renegotiate; moreover, to the extent that they are unravelling, disorder rather than a new global compact is the likely outcome. While acknowledging that some regime change did occur during the Third World challenge of the 1970s, he notes that it was limited in scope and impact. He concludes that indigenous efforts within and among developing countries are far more promising than a strategy of North-South bargaining. Ruggie's scepticism is rather differently grounded than Bhagwati's, but they both see the Global Negotiations as futile.

Perhaps the most informative chapter is by Muchkund Dubey, an Indian diplomat with first-hand knowledge of intra-Third World bargaining. He reveals internal compromises that were struck between oil-producers and oil-importers in sessions leading up to the Havana summit. What his essay reveals more fundamentally is a divergence of views between Algeria, the principal promoter of the Global Negotiations approach, and India over the best tactics for bargaining with the North. This kind of participant-observer's account of internal trade-offs at non-aligned meetings is rare to find. It throws considerable light upon the Indian position at the New Delhi summit. It also provides grist for Bhagwati's mill in charging that 'excessive preoccupation with Global Negotiations' has been counter-productive to Southern interests (p 84).

Bhagwati's argument receives partial support from the contribution of John Sewell and William Zartman which employs negotiation theory to examine the negotiating process itself. They stress the utility of cross-cutting alliances that transcend a strict division into North versus South and they exalt the virtues of incrementalism. They are dubious of prospects for a grand global compact and to this extent endorse Bhagwati's preference for a more limited agenda. (This may sound familiar to readers of this journal, for their chapter appeared in the April 1984 issue of *Third World Quarterly*.)

Whether the Non-Aligned Summit was most influenced by the insights of negotiating theory, regime theory, Bhagwati's vehement power realism, or Indian diplomacy (I would vote for the last), the fact remains that it did approve the general notion of medium-term reform (which the official summit declaration recast as 'Immediate Measures') and the more specific call for an International Monetary Conference. As Bhagwati expressed some confidence that a shift in objectives would break the stalemate, it is fitting to ask how the revised strategy has fared.

More than three years have passed since the Non-Aligned conference. Despite persistent efforts by Prime Minister Indira Gandhi and top Indian cabinet officials who travelled to New York and Washington to press for the monetary conference proposal.

no such meeting has yet to convene. The closest approximation that the North has offered were the sessions in spring 1985 of the IMF's Interim Committee and the World Bank's Development Committee that produced very little in the way of results encouraging to the Third World. The South's shift to Bhagwati's recommended strategy has had disappointing results.

This suggests a reworking of the terms of Bhagwati's argument. He is right about power but wrong about purpose. There is a disjunction between the power that the Third World has and the global changes that it needs. Misled by remarks in December 1982 by the US Treasury Secretary, Donald Regan, about the desirability of world monetary talks, Bhagwati believed that a change in purpose would serve to get North-South talks on the tracks. The problem turned out to be more the intractability of the North than a poor choice of purpose by the South. What is needed is to reverse the terms of Bhagwati's solution: the problem (as some states argued at the Non-Aligned Summit) is not to change the purpose but to change the power. This, of course, is very difficult to do; in one manner or another, the non-aligned states will presumably address this long-term problem at the Harare summit. Robert McNamara welcomed *Power, Passions, and Purpose* as a 'useful road map to more mutually beneficial relations between rich and poor countries'. There is indeed some careful mapping of the North-South terrain in this volume, but the Southern detour away from the Global Negotiations was not the quick road that Bhagwati assumed it to be.

The Touch of Midas: Science, Values and Environment in Islam and the West

Edited by Ziauddin Sardar

Manchester: Manchester University Press. 1984. 253pp. £20.00

Ideals and Realities: Selected Essays of Abdus Salam

Edited by Z Hassan and C H Lai

Singapore: World Scientific. 1984. 369pp. n/p

The Touch of Midas contains a selection of papers presented to a series of seminars entitled 'Science and technology in Islam and the West: a synthesis' hosted in Stockholm by the International Federation of Institutes of Advanced Study and generously funded by the Islamic Solidarity Fund in Jeddah, the Salen Foundation in Sweden, the Spanish Ministry of Education and the King Saud University in Riyadh, Saudi Arabia.

In spite of its impressive subtitle, the most striking feature of this book is that none of the papers is presented in a scientific manner. The key concept of science is never defined and there is a dearth of carefully reasoned argument backed by solid evidence. The most positive contributions are Lloyd Timberlake's survey of the growing environmentalist movement and a listing by M Ali Kettani of some fifty Muslim scientists active from the ninth to the fourteenth centuries (AD) and their achievements together with the contributions of Muslim travellers to geographical knowledge. The rest is speculation, assertion, and special pleading.

The main burden of the special pleading is that all the ills caused by misuse of the

unforeseen effects of scientific research and technological development in the world today could be corrected by the application of Islamic values to science. Two papers list (slightly divergently) and expound these values, which are culled from the main categories of Islamic law, and the final contribution summarises a seminar in which the Western delegates asked how the Muslims thought the values should be applied. The Muslims explained that the topic was still under study by the Islamic Foundation for Science and Technology for Development in Jedda. Clearly, the next step in this exercise is for the Foundation to develop detailed proposals for the application of Islamic principles to specific contemporary problems in science and technology and then have them put into practice by Muslim governments.

Then we shall all look forward to a fresh series of seminars to discuss the application of the results they obtain to the rest of the world.

The reconciliation between Islam and the practice of modern scientific research which was not even approached in the contentious *Touch of Midas* papers has been achieved in the person of Abdus Salam, the subject of *Ideals and Realities*. Honoured internationally as 'one of the finest theoretical physicists in the world', he shared the Nobel Prize in 1979 for his contribution to the theory unifying two of the four fundamental forces known to govern the physical universe, the electromagnetic and the weak nuclear force. His Nobel Prize lecture, which is included in this selection, provides a rare and valuable opportunity for the non-specialist to gain a direct impression of what is involved in work of this refinement and magnitude.

Muslim by birth and conviction, Abdus Salam does not aggressively assert the superiority of his religion but recognises that 'deeper religious feeling is one of the primary urges of mankind' and spends increasingly more of his time, energy, and even his Nobel Prize money on sharing the results of his experience with all mankind, and most especially that of the Third World.

As the essays in this book show, supplemented by a number of published interviews with Abdus Salam and independent accounts of his activities, all his undertakings are centred in a clear understanding of the lessons learnt from direct experience and careful study. They are expressed in tireless, almost superhuman, efforts to create the conditions for the pursuit of fundamental scientific research in every region of the world on the incontrovertible grounds that it is the quintessential mainspring of modern technological culture. Those—and they are still a majority—who imagine that the uncoordinated importation of technological hardware into societies which have no understanding of its working or implications will of itself bring coherent modern development are putting their faith in glittering but empty illusions.

Abdus Salam is convinced that the only realistic remedy for this pathological condition is the education of a critical mass of basic scientists in all countries in coordination with the foundation of regional centres of basic research and adequate provisions for scientists to travel and work among other engaged in their specialist field. The story of Abdus Salam's difficulties, disappointments, and achievements up to 1983 is amply recorded in this book. It makes inspiring reading for talented young scientists in the developing world and very sobering food for the thought of all politicians and specialists in 'development'.

JOAN EBEID
Oxford

The Smoke Ring: Tobacco, Money, and Multinational Politics

Peter Taylor

London: Sphere Books. 1985. 361pp. £2.95pb

The Smoke Ring makes good reading about a major problem. Peter Taylor describes in interesting detail how tobacco's wealth corrupts government and the media. He argues that tobacco advertising and tax revenues, along with the jobs and wealth created, prevent the media from telling the truth about and governments from taking effective action against tobacco's health toll. He shows how media and governments thus join multinational companies to form 'the smoke ring' that protects pecuniary interests at the cost of millions of lives. Unfortunately, some of Taylor's economic and policy analyses are incomplete and lead to incorrect conclusions.

Taylor's descriptions of the corrupting influence of the private tobacco companies is exceedingly well researched and documented. A chapter called 'The media gets the message' provides convincing accounts of tobacco companies effectively censoring articles on the health risks of smoking in periodicals from Britain to Australia. Another chapter illustrates how the companies buy respectability by supporting the arts, describing, for example, members of the London Symphony Orchestra wearing the corporate colours of its patron, Peter Stuyvesant cigarettes. Yet another chapter reveals how the companies avoid certain advertising bans and seek youthful consumers by supporting sports events and concerts. Taylor provides compelling examples of editors and politicians who lost jobs because they opposed 'the smoke ring'.

But Taylor's case that governments do not control tobacco because the industry provides large financial benefits is not compelling. Taylor makes a gross mistake when he says that 'cigarettes . . . bring economic benefits which, in purely financial terms, outweigh the cost of human suffering.' Putting aside the question of how one measures the suffering of the 2 to 2.5 million people who die each year because they smoke, the statement is wrong. One recent US Congress Office of Technology Assessment study put tobacco's annual US cost in health and lost productivity at \$38-95 billion, while the revenues of all tobacco sales totalled only \$30 billion. Similar analyses published before *The Smoke Ring* make similar conclusions for Australia, Canada, the US, and parts of Western Europe.

Two chapters deal with the Third World. In them, Taylor argues that tobacco's wealth has corrupted the Third World's ability to control tobacco use. Zimbabwe, he correctly shows, earns foreign exchange by exporting tobacco. Zimbabwe, however, also undercuts Taylor's thesis because the government has separated tobacco production policy from consumption policy. Partly as a result of a strong anti-smoking campaign, Zimbabwe has reduced cigarette consumption more than any other nation, thus leaving more of the deadly weed for export. This fact weakens Taylor's argument that all governments must first act to reduce economic dependence on tobacco before they can protect the health of their people.

Taylor provides much detail of tobacco's growing influence and effect on Brazil, the Dominican Republic and Malawi, where the multinational tobacco companies have also gained leverage and power with their advertising and profits. He documents the environmental as well as the health costs of tobacco production.

The author, however, glosses over the enormous and increasing use of cigarettes in China and the Eastern bloc, where the industry is state-owned and advertising does not

exist. He hardly mentions China although China accounted for half the growth in world tobacco use over the last decade. Chinese and Polish men smoke at least as heavily as Americans or the British. They also die like Western smokers.

Taylor is correct that banning advertising would help, but it might be more effective to ban smoking in public, something that Taylor apparently does not favour. Taylor defends the smoker's right to smoke without questioning whether smoking by addicts or smoke inhalation by passive smokers is voluntary. His conclusion that anti-smoking groups cannot fight the tobacco companies is premature, as evidenced by the growing list of local governments and corporations in the United States that prohibit or restrict public smoking and smoking at the workplace.

Taylor is also correct that tobacco's financial benefits influence governments' willingness to banish tobacco, though the real power of tobacco probably originates in peer pressure and addictiveness. In any case, his implicit recommendation that governments should not tax tobacco because tax revenues hook governments on tobacco consumption is poor advice. Taxes on tobacco discourage young people from starting and encourage light smokers to quit. Many health advocates now argue for increased tobacco taxes.

The Smoke Ring is a useful, entertaining book, and its history of the private tobacco industry's political influence is well researched. It provides a sense of history and a strong warning to all who risk corruption from the influence of tobacco wealth. It is useful background for serious policy analysis.

The Aluminium Industry in India: Promises, Prospects, Constraints and Impact

V B Lal, D K Abrol, P R Bose and K Kumar

New Delhi: Nistads. 1985. 249pp. n/p

Aluminium is one of fourteen basic products which form the base of an industrialised economy, generating an enormous range of empirically verifiable backward and forward linkages. As one of the strategic materials of the twentieth century no one can dispute the significance of the industry in the Third World struggle to develop. Yet, despite the fact that most of the world's bauxite originates in the Third World, no single country has yet been entirely successful in establishing national control over this important industry. Even India, with enormous reserves of bauxite, great hydropower potential, huge national and regional markets and forty years experience in aluminium production, has so far failed to become 'an aluminium power'. This study seeks to explain why. In pursuit of this aim the authors go beyond official government studies to examine all aspects of aluminium production against a background of wider structural changes in the international organisation of production. The authors begin by outlining how a small group of six multinationals have been able to maintain control over the bulk of the world's aluminium capacity, occasionally resorting to the use of 'extra-economic pressure' to sustain their oligopoly. However, while the Indian industry was initially dominated by these companies (who still possess a significant share of Indian capacity) the problems confronting the Indian industry do not stem from the activities of these

BOOK REVIEWS

foreign companies but from the general underdevelopment of the Indian economy as a whole.

Today, the Indian economy supports five aluminium companies (two state-owned, three joint ventures) with a total capacity of 350,000 tons per annum. However, over the last decade capacity utilisation has fluctuated between 60–70 per cent, requiring increasing imports of metal to meet local demand. This failure to maximise production is largely attributable to the unreliability of power supply and the failure to coordinate infrastructural and directly productive investments. Consequently, although the aluminium sector currently consumes 5 per cent of the national power supply, it is difficult to understand the government's attitude in seeking to limit the use of hydropower by aluminium producers. The government argues that it is better for companies to establish their own captive thermal stations and intensify efforts to conserve energy than for the government to favour aluminium producers with a guaranteed supply at subsidised prices. However, this ignores the point that energy can almost be considered a raw material in itself and that any disruption to supply involves both massive start-up costs and the gradual weakening of the production process. Furthermore, it undermines the potentially catalytic effect that a flourishing aluminium industry would exercise on the rest of the economy. There are, of course, other problems facing the industry, the quality of bauxite is generally low, several raw materials are simply not available locally while the establishment of a central pool of self-generating technological expertise is made more difficult by the various restrictive agreements entered into with foreign companies. Yet against the central problem of power supply these difficulties appear to be minor and capable of resolution by many of the measures recommended by this study. For example, useful suggestions are made in relation to R & D, on the need to develop new applications for the metal (there being no reason why India should follow Western consumption patterns) and on the need to devise a national materials policy.

Today, India possesses a well-balanced aluminium industry with the potential to become Asia's largest producer. On the whole the government has pursued sensible policies to protect the industry—discouraging the export of bauxite and not allowing any one company to dominate. It is the enormous potential of the industry which makes the government's attitude to power supply all the more inexplicable.

RONNIE GRAHAM

London

Nutrition and Development

Edited by Margaret Biswas and Per Pinstrup-Andersen

Oxford: Oxford University Press, 1985. 190pp. £17.00

While it has taken a long time to accept that food and nutrition problems are multifaceted, the issue still remains about generating the literature that could assist policy and decision makers. To compound this problem, ministers and permanent secretaries in Ministries of Planning can come from such diverse fields as statistics, political science, economics and even medicine. In this slim work in the Oxford Medical Publication series, the two editors took the difficult and challenging task of putting together a volume that would take nutrition essentially to development planners.

The introductory chapter on the nature of malnutrition by Payne focuses on the changing perspective of the processes of malnutrition. These new perspectives, the improved physiological and biochemical knowledge of malnutrition and the ineffectiveness of past nutrition programmes have led to the re-examination of the causes of malnutrition. However, there are no simple answers nor are we likely to get any short-cut solutions or technical 'fixes'. While nearly a third of the chapter is on seasonality, work and health, the policy implications of the causal analysis lead well into the next chapter.

Norse's contribution on resource policies and technological change is especially important for Africa, where the thinking is still that natural resources are the principal determinants of food production and nutritional well-being. The summary statements on adoption of modern technologies and on research should be developed further, if for instance, suicidal ventures into high-cost irrigation schemes are to be avoided.

The impact of export crop production on human nutrition by Pinstrup-Andersen, one of the editors, is much studied. In a sense some of the concepts need re-examination. For instance, under what conditions does export crop production turn against the poor? Related to this chapter, is the one by Scandizzo and Tsakok, which is worth reading in order to understand why no precise solutions can be prescribed on food price policies.

The chapter on Food Aid, Nutrition and Development is rich. Biswas's contribution is based on an extensive review of recent studies and documents from international organisations which deal with food aid. It adroitly balances the positive and negative aspects of food aid by focusing on major issues and detailed realities such as transport, personnel and related problems.

The last three chapters, are all by authors from developing countries. Integrated health/nutrition/population programmes are covered by Sampthey and Sai; Mitra attempts to portray the nutrition situation in India and this contrasts with the contribution of Soemadjan on the influence of culture of food and nutrition in Indonesia.

In the context of the African food crisis, the book has much to offer. For instance, the review chapter on supplementary feeding programmes and their design by Kennedy and Knudsen cannot be ignored. The easy flow of the book, minus any polemics on population explosion or ideological partisanship or economic prescriptions should provide welcome relief for those who wish to think as objectively as possible. There are some rather chilling problems. If one agrees with Biswas, the question arises as to which African countries will need food aid in the transitional stages and which nations will never be self-sufficient in food. Scattered throughout the book are ideas where additional research is urgently needed: gender controls of incomes and spending, the empirical studies to determine effects of food aid and agricultural production, research and information on poverty and food etc.

As a hard-bound volume dedicated to Nevin S Scrimshaw—humanist, nutritionist and teacher extraordinary—the book may well be out of reach of most of the intended readers in the Third World. The book deserves to be produced in a soft-covered edition, for then it has a greater chance of providing food for thought for a much larger audience of decisionmakers.

BOOK REVIEWS

State Policies and Internal Migration: Studies in Market and Planned Economies

Edited by A S Oberai

London: Croom Helm. 1983. 347pp. £15.95

The austere title of this volume disguises the crucial importance of the subject-matter in any programme for development whether it be based on market, central planning or cooperative systems. What is discussed throughout the volume, and in particular in the excellent introduction and first chapter by A S Oberai, is at the core of any social change—namely, the labour and population effects of rural and urban development. For too long economists' assumptions about the behaviour of labour linked to material incentives and labour markets have dominated the discussion and this is one book which accepts from the beginning the fruitlessness of pursuing the unregulated labour-market path towards sectorial population balance.

There are six case-studies of basically rural-urban case policies—Malaysia, Sri Lanka, India, Indonesia, Nepal and Poland. The last case-study supports the sub-heading of the book in relation to 'planned economies'. The absence of African and Latin American case studies detracts from the global scope of the book. This is somewhat made up by the depth of the case-studies presented, especially that of Indonesia by J P Perez-Saint and Malaysia by Paul Chan. Perez-Saint links capital accumulation with migratory policies providing useful insights into the foundations of such policies. The India study by Ashish Bose constitutes a catalogue of frustrations and implementation problems arising from state policies, which should serve as a warning to any hopes of changing patterns of migration via rural industrialisation and small-scale industry projects. I Frenkel's analysis of the Polish experience with labour migration provides important information on how centrally planned economies have coped with labour migration, always remembering that the Polish farming policy was an exception to the policies in other Eastern European states.

The scope of the volume is limited in the sense that the authors stick closely to the migratory policies and details and there is little extension of the policies into social conditions, and, in particular, social movements and consciousness that such migrations and policies precipitate. This is to be expected in an International Labour Office associated study in that the political authorities of the organisation have the right to approve all that issues from it. A S Oberai has shown what can be achieved even within that limited framework.

Energy in the Transition From Rural Subsistence

Edited by Miguel S Wionczek, Gerald Foley and Ariane van Buren

Boulder, Colorado: Westview. 1983. 208pp. £16.50

The purpose of this book, as stated by the editors, was to define the problem—or complex of problems—of energy demand and supply in the poorest agricultural sectors

of the developing world. It is the result of an eighteen-month collaborative effort by the International Institute for Environment and Development (IIED), El Colegio de Mexico, the Technical Assistance Department of the Netherlands Foreign Ministry and the Gesellschaft für Technische Zusammenarbeit of the Federal Republic of Germany. The goal of this effort was to sketch the outline of future energy strategies to cope with rural energy problems.

The book consists of eleven chapters, the first two of which serve as introduction. The main material is the case studies in Chapters 3–10 which includes cases from Mexico, Guatemala, Brazil, Jamaica, Senegal, Nigeria, Korea and India. The last chapter is a review.

In the first chapter an attempt was made to abstract a number of key ideas and use them to create a framework for analysing the case studies and defining the policy steps. It includes a discussion on the constraints on subsistence energy use, the transition from subsistence fuels, the context for policy, the constraints on energy technology choices and the move towards new energy strategies. The second chapter contains a revision of energy technologies for rural development. These are divided into energy for survival—including charcoal, ethanol, methanol, biogas and solar cooking—and energy for development, including draught animal power, wind power, solar power (mechanical and electrical), external combustion engines, gasification and internal combustion engines.

The most difficult obstacle in the fight against deforestation is correctly identified as the absence of economic or social mechanisms that ensure the replacement of the trees cut down for fuelwood as free goods from common land. The different constraints on fuelwood plantation, ethanol and methanol production and biogas promotion, such as availability of cash and land, and the absence of an infrastructure were mentioned and discussed. A considerable amount of up-to-date information was given in Chapter 2 on the different energy technologies. Information on costs should, however, be used with great care as they differ enormously from one country to another.

A few comments may be mentioned on these two chapters. The figure of 3.6 tonnes of firewood (about 60 GJ) was given in Chapter 1 as the average annual domestic fuel consumption in developing countries for a family of six. This is compared to energy consumption in cooking in Britain, which, because of the use of more efficient electric and gas stoves and cooking pots, is only about one-twelfth of the value given above. It was not clear whether the author used the figures of primary or secondary energy consumption in Britain. Also, to avoid possible misunderstanding, the figures of domestic energy consumption in developed (industrialised) countries might also be given for comparison. For a family of six, the primary domestic energy consumption in developed countries may be assumed as high as 360 GJ (10 MWh for household, 15 MWh for water-heating and 50–75 MWh for space-heating. The conversion efficiency—30 per cent). This is about six times the domestic energy consumption of the same family size in developing countries. The striking thing here is the higher ratio of the secondary energy consumption of the two families. A family in developed countries may consume about twenty times or more secondary energy than the same size of family in developing countries. What should be emphasised here are two points; first, the families in developing countries consume their energy mainly on cooking. The non-availability of this energy for eating purposes threatens their survival. In contrast, families in developed countries consume their energy mainly on such items as household machines.

BOOK REVIEWS

ce-heating/cooking, water-heating etc. Thus, the non-availability of the energy fired will only affect their quality of life. Second, the family in the rural areas of developing countries depends on fuelwood as the major source of energy. Thus, easing the efficiency of fuelwood utilisation, planting fast-growing species, and finding an acceptable and environmentally sound substitute to fuelwood not only would improve the environmental situation as far as such serious problems as desertification and desertification are concerned, but could also relieve the family from the burden of collecting fuelwood or cutting down trees. This would indirectly contribute to an increase in their productive capabilities. Although, these points follow directly or indirectly, from more than one case-study, they might have been brought into the focus with introductory chapters.

The information given in case-studies is well presented and categorised in a way to facilitate reference and comparison. The information on the present and future rural energy policies of the different countries analysed in the light of their national energy sources and situation are of great interest and considerable importance to decision-makers in developing countries, engineers and scientists working in this field and to national and international organisations involved in rural energy development.

This book succeeds in highlighting many important issues in rural areas such as energy demand and supply and in presenting several case-studies to demonstrate. Among others, the approaches used and the methods of tackling this extremely difficult problem in different countries. It is to be hoped that the book will encourage others to work on this subject and share their experience—whether successful or not—with their colleagues working in the same field.

IA EL-MAHGARY

robi

Collective Clientalism: The Lomé Conventions and North-South Relations

by John Ravenhill

New York: Columbia University Press. 1985. 389pp. US\$49.00

Lomé Conventions, now in their second decade, have generated a considerable amount of North-South study, debate and polemic. The overall objective of this new book by John Ravenhill is to provide a thorough review and evaluation of the implementation of the Lomé Conventions from 1975, when Lomé I was signed, to 1981, the year following the signing of Lomé II.

The theoretical underpinnings of the study are elaborated in the opening chapter which develops a critique of dependency theory for underestimating the room for manoeuvre of Third World states in relation to international structures and external constraints and actors. Drawing upon some of the theoretical insights from the study of non-client relations, the author offers 'collective clientalism' as a more useful alternative approach for understanding and explaining the nature and evolution of P-EEC relations and why the ACP have failed to achieve the objectives they sought in the Convention.

The substantive part of the study begins with the second chapter which describes the

evolution of EEC-Third World relations from the Treaty of Rome, through the two Yaoundé Conventions, up to Lomé I. The following six core chapters marshal and discuss a wealth of primary and secondary source material relating to the Conventions' principal instruments and areas of cooperation: Stabex and Sysmin, commercial cooperation, the evolution of ACP-EEC trade, the sugar, rum and banana protocols, industrial cooperation, and financial and technical cooperation. The final chapter summarises the failings of the Lomé Conventions in relation to the aspirations of the ACP and explains these in terms of the ACPs' inability to negotiate effectively and in terms of shifting EEC perceptions of its economic self-interest: towards the countries of the Middle East and the NICs and away from the ACP.

Although the substantive core chapters of the study are successful in developing a detailed review of the Convention's principal mechanisms over the period under discussion, they suffer from a number of limitations. For Lomé aficionados much of the material presented will already be familiar, reflecting the fact that the study ends its enquiry nearly five years ago. Indeed, the timing of the book is somewhat unfortunate. The final revision of the text, in early 1984, took place during the negotiations that led to Lomé III in December of that year. Many observers agree that the new Convention differs in a number of crucial respects from the two preceding conventions. For this reason, it is a pity that the publishing deadline was not pushed back to enable Ravenhill to incorporate the lessons to be drawn from the latest round of negotiations. With Lomé III into its second year, a study that terminates in the first year of Lomé II cannot but look a little dated. Moreover, given the breadth of scope of the study, it is rather surprising that there is no reference to the issue of human rights since it was a major problem area in the Lomé II negotiations (and even more so in the Lomé III negotiations) and is an issue that sheds interesting light on the political character of ACP-EEC relations.

A number of limitations of the kind of evaluation of the Conventions that is attempted in the study can also be identified. Firstly, because it deals with the Convention as a whole, statements concerning the value of the Conventions' provisions tend to be pitched at a very general, aggregate level of trade and financial flows etc. Secondly, because the author explicitly commits himself to assessing the Convention from the perspective of the ACP, the Conventions are evaluated almost entirely with respect to the degree they have fulfilled, or fallen short of, the aspirations of ACP governments and officials. While this is a perfectly legitimate exercise it does mean that there is very little independent assessment of the *developmental* value of the Conventions' provisions. On the one hand there is little critical evaluation of the uses to which the Convention has been put by the ACP; on the other, and apart from some general comments that suggest that Lomé has both contributed to the diversification of ACP economies and increased ACP dependence upon external assistance, there is little discussion of the developmental impact and consequences of Lomé for ACP economies and societies.

Whether Ravenhill's use of 'collective clientalism' adds to our understanding of the dynamics and limitations of the Lomé Conventions and proves to be a superior alternative to 'dependency', will have to be judged by the book's readers. One problem is that the term is used in at least three different ways in the text: as a heuristic concept to be deployed by the social scientist; as the strategy adopted by the ACP in their dealings with the EEC; and lastly, as the kind of relationship the ACP aspired to construct with

the EEC but failed to do so. This gives rise to a number of ambiguities concerning the theoretical status and role of this construct. Similarly, while it is clear that during the Lomé I negotiations the ACP pursued, to the surprise of many, a genuinely collectivist strategy, it is debatable whether the ACP have pursued anything approaching a collectivist strategy since then. If this is the case, then Ravenhill's attempt to explain the limits of the Lomé Conventions in terms of the internal contradictions of a strategy which simply has not been pursued, is fraught with difficulty.

However, and despite the reservations made above, Ravenhill has produced a valuable contribution to the study of the Lomé Conventions. The fact that the book is extremely well researched, and is both competent and informative, will ensure its enduring usefulness and value for practitioners, scholars and students of North-South relations. It is, nonetheless, a study situated firmly in the macro-dynamics of North-South relations. What is urgently needed now, however, is to complement studies of the macro-dynamics of the Lomé Conventions such as this one with far more independent study and research on the developmental impact of Lomé for specific ACP economies and societies.

JOHN HILL

Botswana: Liberal Democracy and the Labour Reserve in Southern Africa

Jack Parson

Idershot, England: Gower. 1984. 145pp. £11.50

Almost every reader of this small volume (145 pages) will not dispute the fact that the book is quite informative on many aspects about Botswana. Using the political economy approach Dr Jack Parson successfully demonstrates how a colonial power like Britain managed to transform a former prosperous and self-sufficient people into a poor and dependent nation.

The book has seven chapters. Chapter one lays the general background of the whole book and surveys some of the constraints that Botswana faces. These are the geopolitical situation, i.e. the landlocked nature of the country and the reality of a hostile and powerful neighbour South Africa. Others are, for example, the scanty and inadequate rainfall, the vastness of the country and the predominance of a desert type of climate. The primary physical problem of lack of water is thus highlighted.

Chapter 2 looks into how the Tswana lived before contact with British colonialism, what impact colonialism had on them and how they reacted to it. In his examination of the pre-colonial Tswana societies, Dr Parson looks at the economic, social and political organisation of these peoples. He examines the various mechanisms, political and otherwise, that the British used to compel these peoples to go into wage employment in South Africa, especially to the mines. Here he specifically touches on the impact of taxation on the Tswana. It is through these various mechanisms, that 'formally self-sufficient peasants in a tributary society were now partly proletarianised and they

became a peasantry.' (p 26) The end result, he maintains, was the development of South Africa and the underdevelopment of Botswana.

This chapter further looks at nationalism, how it evolved, and, what form it took. Treating the subject historically, Dr Parson shows how the various political parties originated in the then Bechuanaland, what each stood for and how independence was finally granted.

Chapter 3 deals with the role of the state in post-colonial Botswana and discusses the institutions (both political and economic) that prevail in post-colonial Botswana and their functions. It's in this chapter that Dr Parson assesses Botswana's multi-party system and throws some light on how and why it has survived. He not only concerns himself with the ruling party and why it has been winning elections since independence, but also why none of the opposition parties has given it any real challenge.

Chapter 4 is an assessment of Botswana's development strategy. Proceeding from the premise that Botswana's economy at independence was relatively 'weak, externally oriented and underdeveloped', Dr Parson highlights the sources of Botswana's rapid economic growth since independence to date. Here he maintains that minerals, especially diamonds, have been the major source of this growth. He discusses the contribution of the other national asset--cattle. Despite this rapid growth mainly due to minerals and foreign investments, Botswana's distribution of wealth from both cattle and mining is highly skewed.

This point is developed further in chapter five which concentrates mainly on the consequences of the development strategy described in Chapter 4. The disparities between the rural and urban areas and those within each of these sectors are also discussed. Using the results of the 1974-5 income distribution survey for example Dr Parson shows the inequality in the rural sector in the ownership of cattle. Thus 83.8 per cent of the rural households are said to own 25 or fewer cattle while 45 per cent own no cattle at all.

Chapter 7 is concerned with Botswana's position in the region and globally. Regionally, Botswana is still dependent on South Africa; most imports, especially of consumer goods are from the republic. Globally, Botswana remains an appendage of the advanced capitalist countries. While she has sought to reduce dependence on South Africa, she has increasingly become dependent on these advanced capitalist countries.

Chapter 8 concludes the book. While it briefly reviews each of the major themes discussed throughout the book, it also raises a key question about Botswana which is also critical for other developing countries. This is: what are the likely problems of sustaining this dependent development? Will Botswana manage to sustain this type of development in the long run? It is a very good and inevitable issue to raise especially after an analysis of the nature that Dr Parson has carried out.

Indeed, merely having a share in mining is not the same as determining how and in whose interests mining take place: unfortunately Dr Parson does not follow this point. He only predicts (and rightly so), the inevitability of conflict between the peasants and the petty bourgeoisie.

Dr Parson's book raises some interesting points and arguments although he does not develop some of the important points that he raises. Probably this is due to the fact that he attempts to cover too many issues. The example is the point I have just mentioned about the likely implications of Botswana's dependent development.

The concept of 'peasantry' is not adequately defined or explained. Though a new

BOOK REVIEWS

concept, the author uses it as if the meaning would either be obvious or has been given elsewhere in the book. Consequently, the reader may get an unintended meaning. For example, it is not very clear even after one looks at footnote No. 26 (brief description of this concept) of Chapter 2 whether there is a proper working class in Botswana or not.

Otherwise, the book is a milestone in analysing the political economy of Botswana. Without doubt, it can enhance the understanding of Botswana. As a result, I would not hesitate to recommend it to undergraduates, not only in Botswana but in other parts of Africa since the story of Botswana is one among many of similar kinds in Africa.

GLORIA MASAIE

Sociology of 'Developing Societies': Sub-Saharan Africa

Edited by Chris Allen and Gavin Williams

London: Macmillan. 1982. 217pp. £10.00. £3.95pb

It is now over twenty-five years since Ghana, the first sub-Saharan country, became independent and in that time many books and monographs have been published. Some of these books and articles were published to acquire PhD degrees, some to advance academic careers and had very little relevance, and some were written by partisans who were involved in political struggles and are of extreme value because they revealed to us what were the hopes and fears of those who were prepared to sacrifice everything for a free Africa. Here I refer in particular to the works of Fanon, Cabral, Mondlane, Nkrumah, and Lumumba.

Sub-Saharan Africa is today going through its worst crisis. Drought is threatening millions with starvation and death. Almost four million Africans are refugees from one form of disaster or another. In Southern Africa after almost fifteen years of bitter struggles, Mozambique, Angola, Guinea Bissau and Zimbabwe became independent. On the other hand, Namibia is still controlled by racist South Africa, whose forces are conducting genocidal war against the people of Namibia, Angola, Mozambique, and Zimbabwe. In South Africa itself, the racists are determined to hold on to power, no matter what.

It would seem to me that any volume, claiming to discuss the sociology of sub-Saharan Africa, should provide insights into these tragedies. Alas, this particular volume, despite its promising title, discusses none of these topics. Of those who were in the thick of struggle, there is only one selection from Fanon!

The book is made up of an introduction in which the editors try to draw common themes that unite the selections. The selections themselves are grouped into six sub-topics covering colonialism and class formation; gender, production and politics; peasants, poverty and patrons; prophets, priests and rebels; urban poor, and, finally, a section on the African bourgeoisies. Anyone who keeps up with the left-of-centre publications would have come across these articles at one time or another. Some of the articles are published in full, but some are abridged.

Any selection of this type poses problems by its very nature as the articles are bound

to be of uneven quality. The question then, is why would one want another collection, given the fact that there are already so many on the market? It is the nature of the capitalist market to package and re-package old products, which in itself is not bad. This particular volume is part of a larger re-packaging project by Macmillan with volumes still to come for South Asia, the Middle East, South-East Asia and Latin America.

The aim of the 'Sociology of Developing Societies' series, we are told in the preface, is to offer a systematically linked set of texts for use as a major teaching aid at university level. Be that as it may, I am not quite sure if this volume even minimally meets that objective.

BERNARD MAGUBANE

University of Connecticut

Education and Income Determination in Kenya

Arne Bigsten

Brookfield, Vermont: Gower. 1984. 156pp. £14.50

Kenya is among the most successful of the African countries in developing and expanding her educational system. Kenya's Ministry of Education, Science and Technology is one of the few government departments with a high annual budget. With a high population growth, the Kenyan government has constantly found the need to modify and reverse various aspects of the educational system both at the basic and post-secondary levels. At the university level, recent changes have included the establishment of the Moi University in Eldoret and there are plans to make Kenyatta University a fully fledged university and also upgrading Egerton Agricultural College in Njoro to a university status. All the teacher training and agricultural colleges in the country have gone through numerous changes. One of the most significant changes in 1984 was the implementation of the 8-4-4 programme in the basic educational systems in the country.

Arne Bisten's book must be reviewed in context of these changes pervading Kenya education. According to the author, the main purpose of the book is to focus '... the impact of education on labour income and in doing so, it also considers the role of labour market policy and labour market structure. Education is a crucial factor in development policy. This study does not purport to deal with all aspects of interests, but will hopefully contribute to our knowledge about the relationship between education and income in Kenya as well as the functioning of the Kenya labour market.' (p vii). The study attempts, with success, to tell the readers the impact of education on incomes and the effects of labour market structure and policies on the distribution of earnings.

To achieve this, the book is organised into seven chapters with a preface which summarises and sets the tone of the book, and an up-to-date bibliography. The book contains forty-four tables, twenty-nine appendices, and six maps and illustrations analysing various aspects of Kenya's educational and labour economy. It lacks a subject-author index, a list of tables, a list of appendices, and a list of maps and illustrations, but has extensive notes at the end of each chapter. The book would have been improved by placing all the appendices at the end of the book instead of at the end of each chapter.

BOOK REVIEWS

The first chapter contains a succinct summary of post-independent Kenya's extremely rapid development of education within the context of the relationship between labour market structures and the distortions of earnings. The chapter also summarises the major conclusions of each of the six chapters. The evolution of the Kenyan labour market during the twentieth century is discussed in Chapter 2 with special emphasis on institutions and labour policy. An attempt is made to determine their impact on the level and structure of earning. Chapter 3 compares in detail the segmentation of urban and rural labour markets. This chapter proves beyond any doubt that there are wage employment opportunities in rural areas, especially in the public sector, although less diversified than in the rural areas. Chapter 4 contains analysis of the determination of the earnings in the modern sector. The development of Kenya's educational system is described and rates of return to education are calculated and analysed. The changes in the skilled labour market in Nairobi, the primate city and the major employment centre are analysed in Chapter 5. In this chapter the author shows beyond any doubts that there is a degree of integration as this labour market is increasing and that the income distribution within the highly skilled labour group is becoming more equal. In Chapter 6 the determination of smallholder agricultural incomes is analysed with particular emphasis on the role of education. It is shown in this chapter that access to education has large positive effects on income from regular employment which in turn has positive effect on innovations and thus income from agriculture. This will have positive effects on the rural development of the interaction between the urban and rural sectors of the economy. The final chapter pulls the threads together and assesses the impact of educational expansion on the labour market and income distribution.

Arne Bigsten has done a very competent job in analysing and synthesising the complexities of the impact of education on labour income, market policy and market structure. The book demonstrates that the educational system in Kenya has matured since education was introduced in the country by the missionaries so that the British could rule the country with minimum resistance. But in the process and over the years education has contributed to the rural development of the country. The book deserves a wider audience among the scholars interested in understanding education, economics and labour structure in general and Kenya in particular.

In order to understand and appreciate the book's contributions to the debate on the role of education in Kenya, it should be read in conjunction with the reports written by the Phelps Stokes Commission, which set up the Jeanes School at Kabete, as well as the recommendation of the more recent Kenya commission on education, namely Ominde 1964, Bessey 1972, and Gachachi 1976. Since the focus of the book is on the post-colonial era since the 1970s, D N Sifuna's *Short Essays on Education in Kenya* (Nairobi: Kenya Literature Bureau, 1980) should be consulted for the periods prior to 1970. Given its readability, the book will find a readership amongst students of education and economics, planners and general readers who are interested in the welfare of Kenya.

R A OBUDHO

State University of New York at Albany

Amritsar: Mrs Gandhi's Last Battle

Mark Tully and Satish Jacob

London: Jonathan Cape. 1985. 238pp. £10.95

The Sikh political party in India, the Akali Dal, has repeatedly agitated for demand has considered essential to safeguard the position of the Sikhs as a community. Political power for the Sikh community and the promotion of Sikh religious traditions have been seen as essential to prevent the Sikh religion from being absorbed into Hinduism. Besides, the political fortunes of the Akali Dal are linked to Sikh communal solidarity.

Between 1981 and 1984, the Akali Dal launched a civil disobedience agitation against the government which saw the emergence of an extremist fundamentalist Sikh leader Jarnail Singh Bhindranwale. From the sanctuary of the Golden Temple in Amritsar, bastion of Sikhism, Bhindranwale launched terrorist acts against Hindus and moderate Sikhs. In June 1984, after years of escalating Sikh unrest and unsuccessful negotiations with Akali leaders, the Prime Minister of India, Mrs Indira Gandhi ordered the Indian army to storm the Golden Temple. This action, code named Operation Blue Star, resulted in the death of Bhindranwale and many of his followers and in considerable damage to sacred Sikh property. It was seen by many Sikhs as an insult to their religion. A few months later, Mrs Gandhi was assassinated, reportedly by two of her Sikh bodyguards. News of the assassination was followed by anti-Sikh riots and compounded the Sikh community's deep alienation from the mainstream of Indian politics.

The authors focus on the background to the Indian army's action in Amritsar, and provide a detailed anecdotal account of the rise of Bhindranwale, the radicalisation of Sikh unrest and of Operation Blue Star. They hold Mrs Gandhi and a small caucus within her Congress Party responsible for creating the political environment in which Bhindranwale's fundamentalism flourished. It is argued that Bhindranwale was initially brought to prominence by Mrs Gandhi in an attempt to undermine the influence of the Akali Dal. Later, rivalry among two leading Sikh politicians in Mrs Gandhi's government prevented official action against Bhindranwale in spite of his growing extremism. Negotiations between the government and Akali leaders proved inconclusive due to Mrs Gandhi's unwillingness to concede demands which might erode her support from the Hindu majority in India and further emboldened the extremists. The Akali Dal leaders, for their part, initially welcomed Bhindranwale and lacked the political courage to oppose him when he threatened to eclipse their role. Mrs Gandhi, the authors argue, remained indecisive in the face of Sikh extremism and when she finally acted it was 'too much, too late'.

Veteran journalists, Tully and Jacob tell a good story. The limitations of their book stem from their concern with the actions of individual leaders during the past five years rather than the social and political developments which have contributed to Sikh unrest.

RAJIV A KAPUR
Geneva

BOOK REVIEWS

Arab Rebirth: Pain and Ecstasy

Jacques Berque (Translated by Quintin Hoare)

London: Al Saqi Books. 1983. 138pp. £12.00

Bargaining for Reality: The Construction of Social Relations in a Muslim Community

Lawrence Rosen

Chicago and London: The University of Chicago Press. 1984. 210pp. £18.50. £8.25pb

Like the paintings of Van Gogh, the prose of Jacques Berque can be dramatic and colourful—a proliferation of vivid ideas boldly applied in brilliant strokes over the broad canvas of Arab history, geography, and culture. This is a relatively short, impressionistic essay which is free of the convolutions and obscurities of style which mark some of Berque's longer works. It represents the distillation of a life-long fascination with 'Arabism . . . a myth', as he puts it with devastating accuracy, sustained by a culture and sharpened by historical events.'

Berque is so closely attuned to the intellectual and emotional dynamics of the contemporary Arab world that he seems to touch in this essay upon every single topic or opinion currently under serious discussion. These resolve into three main themes: the propensity of the sacred tradition of Islam to pre-empt definition of Arab identity—as in the widely held belief that every Arab, regardless of his confession, must assent in principle to the *Sharia* or Islamic system of religious law; the collision between this sacred tradition and the formation of nation-states intent on securing the benefits of development' based on an alien secular tradition of science and technology; *de facto* Arab helplessness in the face of unremitting interference in their affairs by the alien inheritors of that scientific tradition and its vastly superior physical and economic power. Berque gives no detailed discussion of these themes but presents instead the nuances of their interaction, piling fact on symbol, on opinion, on analysis, on direct poetic expression, with an immediacy that transforms his prose into an inspired representation of living reality.

Nobody is going to agree with every word in this book, but it conveys like no other the essential vitality of contemporary Arab culture, pointing up its dilemmas in a multitude of fresh perspectives and stimulating active minds into renewed thought and more vigorous pursuit of solutions.

In contrast to Berque's lifetime study of Arab culture and reality, Rosen spent twenty months from January 1966 to August 1967 in Sefrou, a small town in the Atlas region of Morocco as part of a group project of American social anthropologists headed by Clifford Geertz, followed by two periods of three and four months respectively in 1969 and 1978. The Americans on the project clearly spent a great deal of time together 'discussing each other's work with the result that *Bargaining for Reality* reads more like a committee's report on an inquiry than an anthropological monograph.

Indeed, Rosen begins the book by writing off 'current ethnography and theory' about families, tribes, quarters, and brotherhoods' ordered by common logic or social structure' residing in 'the rules by which groups are composed and directed' on the grounds that he was unable to find any 'corporate groups' to fit these categories. One wonders where he looked, and for how long.

Instead of all that, Rosen uses North American academic 'philosophy of speech acts

as well as interpretive theory' to reduce all those irrelevant 'structural' categories to permeable 'concepts' which he wrenches clean out of their native cultural context to construct an elaborate tissue of 'theory' interspersed with large claims prefaced: 'In Sefrou society . . .', 'in all realms of Moroccan life . . .', 'in contemporary Moroccan usage and conceptions . . .', 'in Islamic thought . . .', and the like. Needless to say, the resulting theory is more closely related to North American sociological thought than to any tradition-based Moroccan, Arab, or Islamic reality.

Had he taken the trouble to ask them, the people of Sefrou could have explained that the depressingly few examples Rosen cites in his book do not represent the dire struggle of isolated individuals to bargain for reality in an uncertain world. On the contrary, every Sefrawi is born into a complex web of kin, neighbourhood, and community obligations and relationships which are gradually explained to him as he grows up. Experience soon teaches him that there are many reasons why people prefer to evade their prescribed obligations and that his recurrent problem in social life is not how to construct relationships but, more pragmatically, how to activate his pre-existing networks to ensure that he collects the favours due to him as the need arises. This process is clearly illustrated in the incidents quoted in the text.

Nevertheless, this remains a valuable book for anyone concerned with contemporary North American sociological methodology and socio-linguistic philosophy. Once the Moroccan examples cited are taken as hypothetical examples of philosophical theory, the arguments are seen to be carefully thought out and meticulously presented. Rosen covers a large body of theory with exemplary refinement and detail.

JOAN FBEID

Oxford

Bangladesh: A New Nation in an Old Setting

Craig Baxter

Boulder and London: Westview Press. 1986. 190pp. £19.50

Bangladesh: Biography of a Muslim Nation

Charles Peter O'Donnell

Boulder and London: Westview Press. 1986. 332pp. £47.25

Bangladesh won its independence twice. In 1947 it became independent from the British as the eastern province of Pakistan following the partition of India. Twenty-four years later in 1971 it seceded from Pakistan to become Bangladesh. In the first instance, the Bangalis had joined their fellow co-religionists in their struggle for a separate Muslim homeland because they could no longer tolerate the economic exploitation of the absentee landlords who were mainly Hindus. Eastern Bengal, the once 'golden Bangla', with an overwhelming Muslim population had been turned into an impoverished rural slum by ruthless *zamindars* (landlords) who lived in ostentatious splendour in Calcutta. The Bangali Muslims were not only impoverished and debt-ridden but were also educationally and politically backward. In the circumstances, the Bangali Muslims responded enthusiastically to Mohammad Ali Jinnah's demand for a separate homeland

and voted overwhelmingly for the Muslim League in the 1946 general elections which was seen as a referendum for Pakistan.

Although the Bangali Muslims were in the forefront of the Pakistan movement, their struggle for a separate homeland was less concerned with the founding of an Islamic state but rather to escape from the tyrannies of an exploitative economic system. But disillusionment came swiftly. Having got rid of their Hindu landlords, the Bangalis found themselves being exploited by their fellow-Muslims in West Pakistan. Although Pakistan's economic growth was seen as a model for developing countries, the growth was uneven and the economy of East Pakistan was organised for the benefit of the West. All the major industries were sited in West Pakistan; the bulk of foreign exchange and foreign aid were also invested there; and even though East Pakistan earned more than half of Pakistan's foreign exchange through the export of jute, it received paltry sums for investment. Additionally, there was a massive transfer of real resources from the East to West; the disparity in per capita income widened every year and the standard of living for the Bangalis declined.

The economic disparity became intolerable following the military take-over in 1958. As long as there was democracy in Pakistan, the Bangalis could hope to use their numerical superiority to ameliorate their grievances, but with popular representation denied and with scarcely any Bangali in senior civil or military positions, the Bangali leaders despaired of help from the central government and therefore sought control of their own destiny through greater provincial autonomy. The Awami League's six-point programme of provincial autonomy appeared to Bangalis to be a charter of freedom and mobilised widespread support. In 1970, under popular pressure the military rulers agreed to hold a general election but when the Awami League won an absolute majority, the military abrogated its promise to restore democracy and sought to repress the Bangalis through military action. In the ensuing civil war, the Pakistan army was defeated in December 1971 and the Bangali Muslim became independent for the second time.

Both books under review, which are a most welcome addition to the sparse literature on Bangladesh, provide a historical analysis of the emergence of the new state and contain a wealth of up-to-date information not easily available elsewhere.

Baxter's slim volume, *Bangladesh: A New Nation in an Old Setting* is more ambitious and provides a magisterial survey of the history of Bangladesh from ancient times up to the present. He writes with great lucidity and sympathy, shows a deep insight and understanding of the people and the problems of the country, and ends with a message of hope where others have despaired. But this distinguished erstwhile functionary of the US State Department claims greater US sympathy for the democratic regime of Sheikh Mujib than facts would warrant. The US, chagrined by Bangladesh's trade relations with Cuba, had deliberately withheld the shipment of grain under the PL480 agreement, which resulted in the gruesome famine of 1974 and the subsequent overthrow of Mujib. The champion of democracy had undermined another democracy, the consequences of which continues to blight Bangladesh even today.

O'Donnell's *Bangladesh: Biography of a Muslim Nation* focuses more on recent developments and provides a fascinating account of the land, the resources, the society, culture and nationalism of the Bangali people. It is an invaluable handbook written with clarity and contains a shrewd analysis of the political and economic issues confronting the new state. His description of Bangladesh as a *Muslim* nation is provocative. Islam in

Bangladesh is deeply rooted in its soil, and draws heavily from the folk milieu. Religion for most Bangalis is a personal matter: in the mode of dress, dietary habits, customs, language, social and cultural practices, superstitions and even in worshipping of common deities there is little to distinguish a Bangali Muslim from his Hindu neighbour. To accord primacy to Islamic identity is to inject sectarian venom in an otherwise harmonious society—a mischief to which military rulers have often stooped in order to split their opponents.

GOWHER RIZVI

Oxford

Khans and Shahs: A Documentary Analysis of the Bakhtiari in Iran

Gene R Garthwaite

Cambridge: Cambridge University Press, 1983. 213pp. £25.00

In recent decades Western historians and anthropologists have come closer together in common endeavours to re-examine both Western and Third World society and history. One of the welcome features of this trend has been the willingness of both kinds of specialist to learn from each other in studying the 'tribal' peoples of the Fourth World. In most cases, a lack of documentation gives the anthropologist precedence, but various tribal peoples have participated in the economics and politics of states and empires long and actively enough to have left a considerable mark in the archives, sometimes producing their own chronicles. In such cases, historians and anthropologists are on equal ground: the former have 'done history', scouring archives and chronicles as well as oral narratives for information to provide depth to their accounts of social and cultural change; the latter, not content with the often meagre 'facts' to be established from such materials, have enriched their interpretations with ethnographic, theoretical and comparative insights from anthropology.

Among the peoples to have received such combined attention are the Bakhtiari, a 'tribe' of half a million people whose leaders have played a prominent, at times dominant, role in recent Iranian history. Half a dozen Western and Iranian anthropologists have done field studies among them, and their history has been exhaustively researched by Professor Garthwaite, whose long-awaited monograph is now under review.

This cooperation has not been all roses. While anthropologists have not always been as careful or critical as they might in their use of sources, historians have sometimes employed outmoded or inappropriate anthropological theories or concepts. A major problem persists: however welcome the shift of perspective from 'state' to 'minority', the nature of the sources continues to dictate a history of politics and dynasties; tribal economic and social history remain as obscure, and the 'common people' as faceless, as before.

Garthwaite's book, excellent in so many ways, runs foul of some of these problems. Indeed, he is explicit that his history is perforce the history of one family, that of the Duraki khans who have ruled the Bakhtiari from the mid-nineteenth century. As a

result, his laudable attempt to provide an anthropological background to Bakhtiari nomad life remains poorly integrated with the historical narrative and analysis that form the substance of the book.

The first three chapters set the scene. In the first, the author offers a historical and theoretical survey and the 'hypothesis' that the potential for tribal confederation is directly proportional to the strength of an external stimulus; pastoralism militates against confederation, unless there is a need for defence or a push for expansion or conquest; an organised state can itself become the external stimulus, when the potential for confederation is proportional to the degree of bureaucratic organisation. Chapters 2 and 3 discuss Bakhtiari nomadism and tribal political structure. Bakhtiari history is then narrated in the remaining chapters and the documents reproduced in the accompanying supplement and microfiche appendices.

Garthwaite's main concern is the period from the mid-nineteenth century, when useful sources begin, to the 1920s, when Reza Shah Pahlavi effectively removed tribal power. During this period the Bakhtiari were the source of much trouble to the government, and were never wholly brought under control. Their chiefly families were constantly split by rivalries, a factor which government was able to exploit. Their influence grew under Husain Quli Khan, who was appointed the first official paramount chief (*ilkhani*). After his assassination in 1882, his successors continued to dispute the leadership and the inheritance of the considerable landed property which he and his brothers had accumulated. With the discovery of oil in their territory, the main contenders for leadership were able to compose their differences and play a deciding role in the restoration of the Constitution in 1909, and they also dominated the government in the period immediately before World War I. Lord Curzon declared them the single most important people in the British Empire. They were hardly the 'Forgotten People' as they were described by Cooper and Schoedsack in their classic documentary film *Grass* (1924); a film whose depiction of the struggle of Bakhtiari nomads against the elements had a cult following among dissident Iranian youth of the 1970s.

Garthwaite gives a fascinating account of how Bakhtiari khans emerged onto the national scene, and how their wealth and intrigues with each other and the British removed them from the ordinary tribespeople and prevented their following so many tribal predecessors in establishing a new dynasty on the throne.

Anthropologically inclined readers will quibble with some elements of the argument. For example, the 'hypothesis' amounts to little more than a summary of the events of Bakhtiari history. Secondly, for information and ideas on pastoral nomad economics and society, the author too readily follows other historians and political scientists in referring to and extrapolating from F Barth's classic study of the Basseri (*Nomads of South Persia*, 1961); more recent studies of other groups in Iran—including the Bakhtiari—have shown nomadic economy and society to be highly variable, and the Basseri to be often exceptional and inappropriate as a model. Further, the summary of 'khans and tribal structure' in Chapter 3 is surprisingly dry and timeless, and seems remote from the dynamic and rapidly changing picture that emerges in the historical narrative. This narrative, moreover, too often slips into lists of functions and attributes; some passages seem compilations of barely sorted notes, for example the intriguing but baffling account of dynastic marriage ties, where some tables and diagrams would have helped considerably. Finally, the conclusions, seeking in Bakhtiari society reasons for

the khans' failure to unite in response to Pahlavi policies, offer a somewhat lame, integrationist analysis of inheritance, marriage and succession practices.

These quibbles do little to detract from the interest and value of an important book.

RICHARD TAPPER

*School of Oriental and African
Studies, London*

Unreal Growth: Critical Studies on Asian Development

Edited by Ngo Manh-Lan

New Delhi: Hindustan Publishing Corporation (two volumes). 898pp. \$48.00

The real Asian drama, in which the vast majority of the peoples of Asia are real-life players, continues to be the struggle to burst out of the shackles of persistent mass poverty. Half-way into the Third United Nations Development Decade, one observes that the governments of the developing countries, forming the majority of the members of the World Bank and the International Monetary Fund (IMF), continue to be directed principally by socio-economic policies based on the view that growth is a sufficient condition for development. When confronted with the dismal record of this growth orientation, the World Bank maintains that what is needed is not the abandonment of the policies, but the intensification of the growth process by re-directing investments from the non-rural sector to the rural sector, so as directly to improve the living conditions of the rural poor. The World Bank holds the view that the major factors which explain persistent poverty are rapid population growth, lack of access to production inputs and the lack of human and physical capital. However, while acknowledging the importance of improving equality in the access to production inputs and in the ownership of capital, the Bank dismisses the question of adjustment in power relations as being 'politically disruptive'.

Given the dominance of the World Bank's approach in the national development policies of the vast majority of Third World countries, it has become of most crucial importance that the operability of that approach in Asia, where three-fourths of the world's one billion people live in absolute poverty, be subjected to scientific scrutiny.

The Asian scholar, Dr Ngo Manh-Lan, has edited a two-volume collection of scientific papers on underdevelopment in Asia, indicating the controlling role of prevailing social structures (ie power structures) in explaining persistent poverty. The papers note that some growth has occurred in the Asian economies during the post-war era, but observes that such growth was distributed in a highly skewed fashion with the rich few benefiting at the expense of the poor masses. In *Unreal Growth: Critical Studies on Asian Development*, Ngo Manh-Lan's purpose is to present a scientific analysis of 'those economic models and policies which have aggravated social inequalities and injustice, and have moved away the country from the goal of self-reliance and national independence, both political and economic.' Ngo Manh-Lan sets out to achieve his purpose by presenting papers covering national and international aspects of underdevelopment in Asia in four main parts: Asia in World Politics and Asia's Industrial Development form the two major areas in volume I; in volume II, one

BOOK REVIEWS

finds Asia's Agricultural Development, and the final part dealing with development theories. The collection of papers, resulting from the research conducted by Ngo Manh-Lan at the United Nations Institute of Training and Research (UNITAR), were written by a collective of scholars on Asia and include case studies of fourteen Asian countries. The experiences of Eastern and Western industrialised countries are presented in some of the papers to the extent of their relevance to the scientific understanding of the Asian drama.

In Asia, the World Bank's export-led growth model utilised by Hongkong, Singapore, South Korea and Taiwan is widely considered to be successful and exemplary for underdeveloped countries. The experience of South Korea is typical of the experiences of the so-called Third World 'miracle economies' pursuing policies under the export-growth model. Ngo Manh-Lan has included in *Unreal Growth* a paper on South Korea by Harold Hakwon Sunoo. The findings of Sunoo can be summarised as follows:

- 1) Economic growth in South Korea has been achieved at the expense of agricultural development.*
- 2) South Korea is highly dependent on foreign capital.
- 3) Export-oriented industrialisation in South Korea benefits foreign investors, mainly from the US and Japan, at the expense of local industrial development: local initiatives in entrepreneurship are being stopped.
- 4) South Korea has an extremely high and increasing dependence on foreign loans due largely to the financing of the importation of inputs for export-oriented industrialisation; South Korea's debt is now approximately \$50 billion and most of South Korea's loans are used by top business people who depend considerably on their corrupt relations with state authorities.
- 5) Only 11 per cent of South Korea's workers earn sufficient money to support a family of four persons.

In capturing the essence of the evidence on the operability of South Korea's export-led growth policies, testimony in the US Congress has arrived at the conclusion that 'the absence of full human rights is neither arbitrary, nor coincidental, it is the product of the choice to have an export-oriented economy which leaves internal needs unmet.' (US Congressional Record, 5 April 1978: H2517).

Within the context of social relations in Asian countries pursuing export-led growth policies, the dominant classes use all means within their power (including the increasing use of force) to maintain the prevailing social structures, which are strengthened in a way that runs counter to poverty alleviation.

What then is the way out in the Asian drama? The last part of *Unreal Growth* in volume II provides some thought-provoking analysis in the current process of rethinking the theoretical basis of development strategies. While the strategy of 'selective delinking' is scrutinised in operational terms (Thomas Weisskopf), Professor P C Joshi in his contribution delineates a poverty-alleviating development approach. To

* The latest evidence on the South Korean economy points to the sluggish growth experiences in the economy; see Paul Ensor, 'South Korea: no grounds for optimism' and Anthony Rowley, 'End of Asian economic miracle?' in *Far Eastern Economic Review*, 12 September 1985, pp 114 and 123, respectively. See also, *Far Eastern Economic Review*, 20 September 1985, 'NICs in a twist'.

achieve equity (ie sustained improvement in the livelihood of the masses), there must be growth, but to attempt to achieve growth without equity places growth in danger. Clearly, the solutions, outlined in Ngo Manh-Lan's introduction, are to be found within the context of the very visible struggles of the oppressed classes of Asia to change radically the social structures in their (the oppressed) own interest.

In editing *Unreal Growth* covering such a wide range of topics in depth, Dr Ngo Manh-Lan has made yet another important contribution to the further understanding of mass poverty. All serious scholars will find *Unreal Growth* to be most useful, and organisations engaged in the struggle for poverty alleviation, a vital source of weaponry.

The Security of South West Asia

Zalmay Khalilzad

Aldershot, England: Gower. 1984. 191pp. £9.95pb

The Iranian Revolution and the Soviet invasion of Afghanistan not only generated apprehensions and sent what an eminent scholar referred to as 'shivers down the spine of the world' but also injected an acute sense of urgency among the Western scholars to analyse and comprehend the rapidly moving events of Southwest Asia. Vast amounts of literature covering the area have been produced during the short span of the last five years. However, the major emphasis, in most of the writings dealing with this region, was on the security aspects; this book is another useful and significant addition to the existing literature on the area.

Khalilzad's book is an especially important contribution in the sense that it draws our attention to endogenous factors of political instability in Southwest Asia. His notion of political stability defined in terms of regime legitimacy, regime effectiveness and the relative strength of the opposition (p 7) is a worthwhile conceptualisation. Deeply rooted in an elite and liberal theory of politics, this conceptualisation helps us to get a good grasp of very diverse political processes under way in the countries of the region. Yet Khalilzad's work fails to address the key dimension of the issue of political change in Southwest Asia. Not much attention has been paid to the bureaucratic-state domination and how state structures in these countries have been sustained either through processes of internal coercion or external collaboration. It is difficult to properly comprehend the dynamics of the conflictual politics of the Southwest Asian countries without coming to grips with and paying well-deserved attention to the key question of state plus class domination, which has been at the centre of most protest movements in these countries. The overthrow of the Shah in Iran, the Communist takeover in Afghanistan, and the rise of the Pakistan People's Party (PPP) in Pakistan reflected a growing alienation of the people of these countries with the injustices of the operative system. Nowhere in his book does Khalilzad show any concern with the mass sentiment which spawned and sustained these protest movements. He frames the entire question of political stability in these countries without dealing with the central political concerns of the people living in them. Despite this major neglect, the book offers a good

BOOK REVIEWS

description of the group politics of Southwest Asian countries; it is the first study of this kind and the effort at comparison is commendable. While most of the scholarly literature focuses on external sources of instability, Khalilzad's book departs from this tradition and focuses on micro social processes to explain the dynamics of sweeping changes that have gripped the area. Yet his theoretical view is not broad enough to give us insights into the most important issue of class and state politics in these countries.

Khalilzad concludes the book by listing various difficulties that impede the regional security arrangements and emphasise that the regional security arrangements are highly unlikely. Most analysts would agree with Khalilzad's conclusions provided India, Pakistan, Afghanistan and Iran are lumped together in a region. But most writers tend to regard India and Pakistan as part of the South Asian region and only a few writers and many Pakistanis like to identify Pakistan as part of the Southwest region and not part of South Asia.

Haiti in Caribbean Context: Ethnicity, Economy and Revolt

David Nicholls

London: Macmillan. 1985. 282pp. £30.00

David Nicholls' *Haiti in Caribbean Context* is a collection of major articles on Haitian history, politics, and sociology. It illustrates the development of Nicholls' thought on Haitian questions over the last fourteen years but suffers from an uneven quality. Some pieces seem to have been included only to make a more comprehensive book. However, Nicholls' discussions of peasant revolt, emigration, and contemporary Haitian politics are substantial. They turn on the question of constituency, Nicholls arguing that agrarian rebels of the nineteenth century, 'boat people' of the twentieth, and the Duvalierist elite have been of small landholder and petit bourgeois origin. He is convincing for the present era, but marshals insufficient evidence to substantiate claims about the class origins of nineteenth-century peasant insurgents.

Haiti in Caribbean Context dwells on the impact of race on Haitian society, but makes no clear distinction between Haitian 'legends' of the past as practical ideologies on the one hand, and race as a structural component of Haitian society on the other. Nicholls is best when he is attentive to the political and historical context, as in the fine studies of Salomon and economic dependence. Yet, he has largely retreated from the perspective of those pieces. He eschews a critique of imperialism, and the view that current Haitian problems are rooted in anything other than Haitian particularism and the occasional abuse of power.

These characteristics betoken a subtle conservatism, but when Nicholls attributes this to the Caribbean masses, he is not exclusively projecting his own views. Traditionalism is indeed real, and the possibility of enlisting it in the service of social transformation does exist. Nicholls looks for such an initiative in a state which will 'encourage and

enable' rather than 'manage'. He does not, however, seem to realise that only a statist decision can make the political decentralisation which he seeks appear. In this instance, a concern for peasant autonomy insufficiently disguises a predisposition against meaningful change.

Information for Authors

Third World Quarterly welcomes contributions on important Third World matters; preference will be given to those which deal succinctly with an issue which is both important and clearly defined. Articles which are narrative or descriptive and lacking in analytical content are unlikely to be accepted. Comparative articles are welcome but should incorporate a balance of empirical evidence and theoretical speculation. The writing style should avoid academic jargon and colloquialism, and manuscripts should be carefully checked for errors.

Articles submitted to *Third World Quarterly* should be original contributions and should not be under consideration by any other publication at the same time: if an article is under consideration by another publication the author should clearly indicate this at the time of submission; if published in *Third World Quarterly* it cannot be reproduced in whole or substantial part elsewhere without permission from the Editor of *Third World Quarterly*. The Editor is responsible for the selection and acceptance of articles, but responsibility for errors of fact and opinions expressed in them rests with their authors. Copyright in articles published in *Third World Quarterly* is retained by the journal.

Full names of the authors should be given together with the full address to which correspondence should be sent, and, where possible, a contact telephone number. Current and recent academic and professional affiliations, for use in the 'Notes on Contributors' section should be supplied, together with a list of major publications (with dates) and of forthcoming books.

Authors are not expected to correct proofs of accepted articles. Every effort will be made to avoid errors and contributions will be checked at both galley and page-proof stages.

Authors are entitled free of charge, to twenty-five offprints and five copies of the issue in which their article appears.

Presentation of Manuscript

- Authors should submit two double-spaced typed copies (in English) on one side of A4 opaque paper. An additional copy should be retained by the author as manuscripts are not returned to authors.
- An abstract should be submitted with the manuscript; this is to comprise a one-paragraph summary of the main points of the article in not more than 150 words.
- Allow one inch margin on left-hand side and number manuscript pages consecutively throughout the manuscript. Broad divisions and section headings should be clearly marked where appropriate.

INFORMATION FOR AUTHORS

- Footnote numbering should be clearly marked in the text and the notes placed at the end of the manuscript, not at the bottom of the relevant page.
- Tables (including graphs, maps, figures) must be submitted in a form suitable for clear reproduction on a separate sheet of paper and not within the text. Each table should have a brief descriptive title. Place all footnotes to a table at the end of the table. Define all data in the column heads. Every table should be fully intelligible without reference to the text. If camera-ready artwork cannot be provided by the author, our printers can undertake the preparation of tables within certain financial constraints.
- If any figure, table, or more than a few lines of the text from previously published material are included in a manuscript the author *must* obtain written permission for republication from the copyright holder; the original source should be clearly noted and acknowledged.
- For punctuation, spelling and style, follow the *Oxford English Dictionary* and the *Oxford Dictionary for Writers and Editors*.

Footnote Style

- In the case of books, the author, title of the book, place of publication, publisher, date of publication, and page numbers should be given in that order: e.g. J S Kirk, *Middle East on Trial*, London: Bodley Head, 1977, pp 3-9.
- In the case of articles, the author, title of article, name of the journal, volume number, issue number in brackets, the year and the page numbers should be given in that order: e.g. J Birks, 'Migration in the Middle East', *Middle East Review* 5 (4) 1979, pp 27-32; or in the case of articles/chapters within books: J Birks, 'Middle East Labour' in *Middle East Today*, S Sinclair (ed), London: Frank Cass, 1978, pp 28-36.
- Reference to privately circulated or mimeographed material should also contain full references including the name of the appropriate department of the institution concerned.

Third World Quarterly will do everything possible to ensure prompt publication once a contribution is accepted. This will be facilitated if all manuscripts and illustrations conform to the form and style detailed above. Manuscripts that do not follow this format may be returned for resubmission.

Authors are strongly advised to examine issues of *Third World Quarterly* in conjunction with the reading of these notes.

Deletions and Alterations

If the Editor is of the opinion that articles provisionally accepted for publication need to be shortened or particular expressions deleted or rephrased, such proposed changes will be submitted to the author for approval prior to publication. Corrections of errors in punctuation, spelling and style will *not* be submitted for approval if they do not alter the meaning or sense of the original manuscript.

NINTH NATIONAL THIRD WORLD STUDIES CONFERENCE

October 16 - 18, 1986
Peter Kiewit Conference Center
Omaha, Nebraska

Abstracts of papers for this **Inter-disciplinary forum** should be submitted, along with a curriculum vitae, by May 1 to the Conference Secretariat, Ann Welty, at:

New from the Third World Foundation

URDU LITERATURE

by D. J. Matthews, C. Shackle & Shahrukh Husain

In this concise yet thorough history of the Urdu language and its literature over the last four centuries the authors discuss Urdu's rich poetic tradition and the significant role Urdu has played in the past two hundred years as the symbol of intellectual identity of the people of Pakistan and Northern India as well as their prime medium of education and literary and political expression.

One of the few books on the subject to be published in English, Urdu Literature is aimed at the general reader who wishes to discover something of the history of Urdu's development and to understand why its literature continues to exert a special fascination for those who are able to enjoy its beauty in the original.

THE JOURNAL OF DEVELOPMENT STUDIES

Since its foundation in 1964 **The Journal of Development Studies** has established itself as a major international forum for the discussion of the fundamental issues of development. It has published many seminal articles, opened up many areas of debate, and broadened its scope to interpret the concept of development in its widest sense. Each issue contains a number of full-length research articles, notes and comments, review articles and a book reviews section.

Notes on Contributors

Peter Flynn is Titular Professor and Director of the Institute of Latin American Studies, University of Glasgow. His publications include *Brazil: A Political Analysis* (1978) and *Brazil: The State and Opposition 1978–1985, Parties, Pressures and Policy Implications* (forthcoming).

Tim Shorrock is a journalist specialising in South Korean politics and US–Korean relations. He lived in South Korea from 1959 to 1961 and is now based in Washington DC.

Carmel Budiardjo is Editor of *TAPOL Bulletin*, a publication which reports on human rights abuses in Indonesia, East Timor and West Papua. She is the co-author of *The War Against East Timor* (1984); the TAPOL publication, *West Papua: The Obliteration of a People*; and *The Suharto Years* (forthcoming).

David Nicholls is a Senior Associate Member of St Antony's College, University of Oxford, and an Associate Fellow of the Centre for Caribbean Studies, University of Warwick. He is also Vicar of Littlemore Parish Church, Oxford. He is the author of *Haiti in Caribbean Context: Ethnicity, Economy and Revolt* (1985).

Louis René Beres is Professor of Political Science and International Law at Purdue University, West Lafayette, Indiana. His publications include *Mimicking Sisyphus: America's Countervailing Nuclear Strategy* (1983); *Reason and Realpolitik: US Foreign Policy and World Order* (1984); *Security or Armageddon: Israel's Nuclear Strategy* (1986); and *America Outside the World* (1986).

Morris J Blachman is Associate Professor of Government and International Studies and Associate Director of the Institute of International Studies at the University of South Carolina, Columbia. **Kenneth Sharpe** is Associate Professor of Political Science at Swarthmore College, Pennsylvania. They are co-authors of *Confronting Revolution: Security Through Diplomacy in Central America*.

Richard O'Brien is Chief Economist of American Express Bank, and Senior Editor of the *AMEX Bank Review*. He is a former consultant to the World Bank, Washington DC.

NOTES ON CONTRIBUTORS

Steve Sawyer is Executive Director of Greenpeace USA. He has been member of Greenpeace since 1978, and served on the *Rainbow Warrior* from 1980 to 1982. He is the author of the Greenpeace publication, *French Testing at Mururoa*, which was presented to the annual summit of the South Pacific Forum in Rarotonga, Cook Island, in August 1985, at which the South Pacific Nuclear Free Zone Treaty was adopted.

Edward E Azar is Director of the Center for International Development and Conflict Management, and Professor of Government and Politics at the University of Maryland, College Park. He is the co-author of *Lebanon and the World in the 1980s* (1983); *Emergence of a New Lebanon* (1984); and *International Conflict Resolution* (1986). **Robert Haddad** is a Junior Fellow at the Center for International Development and Conflict Management, University of Maryland, and Editor of *Lebanon Monitor*.

Chris Mowles is Field Secretary on the Middle East Desk of a British development agency, for which he was Projects Officer in South Lebanon from October 1984–October 1985. He is a former Research Officer for the Council for the Advancement of Arab–British Understanding (CAABU).

Christopher Clapham is Senior Lecturer and Head of the Department of Politics at the University of Lancaster.

Randolph Kent is a Visiting Fellow at the Refugees Studies Programme, Queen Elizabeth House, Oxford.

Peter Calvert is Professor of Comparative and International Politics at the University of Southampton.

SOUTH AFRICA:

Human Rights Quarterly

Volume 8, Number 3

Human Rights Quarterly

Is it true that "Nothing Really Gets Better" in South Africa, as South African attorney Chris Nicholson contends in his pessimistic reflection on twenty-five years of tragedy between Sharpeville and Uitenhage? In the current issue, **HUMAN RIGHTS QUARTERLY** publishes relevant and timely discussions on the legal aspects of apartheid, the Langa shootings, and divestment, topics taken from the 1985 symposium on South Africa cosponsored by the Lawyers' Committee on Civil Rights and the Standing Committee on World Order of the American Bar Association. For a serious look at the law in contemporary South Africa, the August issue of HRQ is required reading.

EA 86

Democracy and the Pacific Century

The emerging century has already been named after the Pacific, the area of the most dynamic growth in the last decade and of possibly the greatest potential in the future. But the people who have had to live under the shadow of the 'economic miracles' of the Philippines, South Korea and Indonesia are trying to grasp what remains of the twentieth century to ensure that their future is not a continuation of the military-bureaucratic condominium which has consumed every aspect of their lives until now. After the fall of Ferdinand Marcos it seems increasingly likely that 'political miracles' may be what to look for in this region.

The theory beloved of some Western economists is that but for their 'growth-oriented dictatorships', these countries would not have achieved the economic prosperity and industrialisation that they have. However, growing debt burdens, falling oil and commodity prices and increasing protectionism in the North are going to mean lower growth and greater unemployment in these economies. Indonesia's growth rate this year is predicted to be negative as it faces a major economic collapse caused by falling oil prices and a withdrawal of foreign investment. South Korea may have welcomed the failure of the Jenkins Bill in the US Congress which would have severely cut its textile exports, but this may be only a temporary respite because the pressure for protectionist measures has not yet ebbed in the US. Political protests in South Korea, especially those by students and farmers, have deplored the economic subjugation of their country to America.

In an atmosphere of growing economic discontent the system of political succession is being questioned by the South Koreans who have lived under twenty-five years of military rule, and, more cautiously, by the Indonesians who have suffered twenty-one years of the Suharto dictatorship.

As studies in transition from military-authoritarian to civilian-democratic rule, what is distinctive about South Korea and Indonesia is that the ruling party has already established the mechanism of succession to assure the continuity of the military order. President Chun Doo Hwan is committed to holding elections and stepping down in 1988 by the terms of the constitution which he himself promulgated under martial law. But the South Korean opposition, particularly the leading dissident Kim Dae Jung, are certain that indirect elections for the presidency held under that constitution will be manipulated by the

government to assure the success of the ruling Democratic Justice Party and give the opposition New Korea Democratic Party no chance of winning. The focus of the struggle therefore is the campaign for constitutional revision to allow direct elections, rather like the '*diretas ja*' campaign in Brazil in 1984.

President Suharto runs such a confident and efficient dictatorship that Golkar, the state party, has already counted the votes it needs to win the next general election in 1987: 61,391,869. Few doubt that they will be able to meet, if not improve, this target. Unlike the vigorous South Korean opposition, the signs of dissent in Indonesia are limited to the Group of Fifty which sent letters critical of government actions to the People's Consultative Assembly and the White Paper which called for an investigation of the government killings in the Tanjung Priok riot of September 1984. Even these limited protests have resulted in charges of subversion and prison sentences against those associated with them. The absence of organised, effective opposition is a testimony to the ruthlessness with which Suharto has suppressed dissent rather than an indication of political quiescence and contentment. As a measure of his resolve, in 1985 Suharto executed three communists who had been in jail for ten years or more and, in a signal to the restive Muslim movement of which he is deeply suspicious, he executed imprisoned Muslim activists as well.

Before President Reagan set out on his 'winds of freedom' tour of Asia, the Administration had already indicated to Congressmen who were drawing attention to Indonesia's brutal annexation of East Timor and Irian Jaya (West Irian), that human rights issues would not be raised publicly. However, Indonesia's expulsion of the Australian journalists in the presidential entourage immediately as they arrived in Bali provoked the US Secretary of State, George Shultz, to criticise the illiberality of the Suharto regime. But for that incident Shultz would probably have been as fulsome in his praise and support of Suharto as he was for Chun Doo Hwan during his Korean visit.

The support expressed by both US Defence Secretary, Casper Weinberger, and by George Shultz during their Korea trips for Chun Doo Hwan earlier this year, and the fact that Shultz declined to meet the leading opposition personalities, Kim Dae Jung and Kim Young Sam, reinforced the impression among Koreans that the US supported the dictatorial rather than the democratic alternative in their country. The protest movement in South Korea has generated debate about issues which until now had remained above question: the relationship with the

US and whether the nature of those ties and the stationing of US troops and nuclear weapons in Korea is not an obstacle in the way of progress towards reunification with the North and a more comfortable relationship between Korea and her neighbours. The dubious distinction of being a front-line state in Northeast Asia has been a source of funds and support for successive military regimes, but for the Koreans it may be yielding more burden than benefit. That Korea is part of the Pacific, of Asia and of the Third World is that part of their identity which has been denied Koreans by virtue of being a front-line state and little else. The 1988 Seoul Olympics are being compared, in their significance to South Korea, to the 1964 Tokyo Olympics which marked the recognition of Japan as a major economic power. However, the Koreans seem unwilling to allow the realisation of their political rights to wait upon the successful staging of this event, and that consciousness marks the coming of age of the Republic of Korea.

An increasing number of Asian autocrats seem to want to exploit the trappings of representative government by mimicking its institutions. In Pakistan and Bangladesh, as much as in South Korea and Indonesia, they have found that holding elections and having assemblies, within parameters set by the regime, can strengthen their control and power base in society. The electoral process can be managed or simply rigged: the assemblies returned after such elections become another secure constituency for the military, and this caricature of democracy can assuage the US Congress in time to pass the next aid package or arms deal.

Although this mock democracy lacks legitimacy in the eyes of the people, it still makes the struggle of the politicians and the dissidents who remain outside the system more difficult. While the insurgent and the revolutionary reject the system totally, the democrat has to engage in dialogue and protest to force the government to hold clean elections. To compromise with the regime and its rules would bring the risk if not the certainty of succession without change. However, the Philippine precedent shows that if the ruling party steals the elections in a society which is highly mobilised and very supportive of the opposition, the anger at being cheated of victory can release the final energy which will overthrow the regime and bring an about-face from its foreign backers. The South Korean situation is encouraging inasmuch as the more radical element of the dissidents will not allow collaboration between the politicians and the regime and the recognition of their strength seems to be dawning on the military. In Indonesia, however, the

timetable for a genuine succession may be far longer and more bloody and Suharto's *pancasila* ideology may suffocate the archipelago for many years to come. Suharto's own design is to continue at least till the year 2000; by then he hopes the New Order will be able to outlive him.

Alan García Pérez

Dr Alan García Pérez is Constitutional President of the Republic of Peru.

Born in Lima on 23 May 1949, he was educated at the Catholic University of Lima, receiving his law degree from the San Marcos National University. He continued his studies in Europe at the Complutense University of Madrid where he gained his Doctorate of Law, and at the Sorbonne and the Institute of Higher Latin American Studies in Paris. On his return to Peru, he took up a university teaching post while also acting as the National Organisation Secretary of the Alianza Popular Revolucionaria Americana (APRA) party. He was elected to the Constituent Assembly in 1978, and thence to Parliament in 1980, before being appointed Secretary-General of APRA two years later. On 14 April 1985 he successfully contested the presidential election to become, at thirty-six, the Republic's youngest president. Alan García's inaugural address on 28 July 1985 included the announcement that his administration would limit the service payments on Peru's \$14bn foreign debt to no more than ten per cent of the country's total export revenue over the following year.

Alan García is the author of El Futuro Diferente, La Tarea Histórica del APRA (A Different Future, APRA's Historical Task).

Altaf Gauhar interviewed Alan García in Lima in June 1986.

AG: *Mr President, the Third World has three young leaders at present, Rajiv Gandhi in India, Robert Mugabe in Zimbabwe, and Alan García in Peru. Rajiv Gandhi is the current Chairman of the Non-Aligned Movement, Robert Mugabe will take over as Chairman next August and there is some speculation in the press that Peru might be chosen to assume the Chairmanship of the Non-Aligned Movement after Zimbabwe.*

GARCÍA: *Thank you.*

AG: *I have come in the hope that I can learn something from you about your experiences in office. You were elected on a popular mandate and you have questioned the international economic system; you have taken up a radical position on external debt; and you have challenged the arms bazaar and the drugs mafia. How would you assess your first year in office?*

GARCÍA: *There are two aspects of my programme: the economic aspect and the political aspect. As regards the first, our objective is to*

stabilise the economic situation in the country before introducing fundamental structural changes in the system. We have been able to bring down the interest rate. There has been an increase in the purchasing power of the consumer. Our effort is to activate and regenerate our industrial capacity without inflating prices. The high level of inflation in Peru was due partly to low industrial production and partly to the financial costs arising from the distortions within the financial system. The level of inflation has been brought down to a third of what it was last year and we have achieved a 5 per cent rate of growth in the last eleven months. The state has intervened directly to promote the creation of jobs to strengthen demand and galvanise the economy. The economic depression looked like raising the rate of inflation to 300 per cent in Peru. Now it is down to 60-70 per cent and we are on the way to reducing it further. We were worried about inflation, not only because its consequences are widespread and inequitable but also because there has never been a social revolution accompanied by a spiral of inflation. These are considerable achievements. But they will remain fragile and ephemeral if they do not lead to a fundamental restructuring of the economy. Without that the re-activation of the economy will not add to the wealth of the people. Today wealth in Peru is distributed irrationally. We have powerful monopoly groups and a dominant financial elite in stark contrast to mass poverty which is a dramatic and poignant illustration of unequal distribution of wealth. We could not have attempted to change this before bringing inflation under control.

The first year was devoted to stabilising the economic index. The second year will see the beginning of the process of the economy and society. We began with the root problem in the financial sphere and we must now take fundamental economic reforms. We understand that, apart from the domestic distortions of our economy, there is the question of repayment of external debt. I see that as the greatest limitation. We have taken a firm stand on this as you know. That is the economic balance-sheet today.

As regard the political aspect, there is the credit side and the debit side. On the credit side is the trust which the people have regained in the government. They know that they have a

government that works. It is in control of the economy and it is prepared to take political decisions to maintain order in the country. Even the events which occurred in the prisons in the last few days have a positive side. People know that their government will defend democracy whatever the cost.

But there is the debit side. We face a subversive terrorist movement which is very widespread in the country and which has lost respect for the state and society. We attempted this year to negotiate with them and we made certain concessions. As a result, the judicial authorities released half the prisoners. All this was intended as a gesture of goodwill. And what was the response to this gesture? They murdered 140 policemen and more than 1000 civilians, including government officials. They believed that our gesture of goodwill was evidence of the weakness of government.

The prisoners rioted four times. We sent officials from the Ministry of Justice and we made concessions. It was a mistake. One of the concessions we made was to give them building materials and cement to construct dormitories and sport areas. They used these to make a stronghold to fight off any attack. They declared that nobody would take them out of jail, not even for judicial trial, which they spurned as a 'bourgeois trial'. They would not even agree to move to a new, very modern jail that the government has built. It was after all this that we had to take the drastic decision—to deploy the instruments of the state, within the requirements of law, to impose order. Those who violate the law will be punished. The state is guilty of 200 deaths. I *am* sorry that forty, fifty or sixty people were shot as a result of the indiscretion of the troops. It was one thing to restore order and to bring the prison population to surrender but shooting some of the prisoners after they had surrendered was intolerable. You must have heard my message to the people broadcast two days ago. I said that order has to be established through the law, and, if necessary, the use of force. The law is humane, it envisages persuasion and if that fails, the use of weapons up to a point. If it becomes unavoidable the whole range of legitimate weapons can be used. But law recognises its own limits. That's what I said in my message. I am sure that the majority of the people agree with me. There are only about two thousand people who entertain ideas of

absolute intolerance. For the last ten years they have recognised no law and have been doing whatever they wanted. That is over now. But I am determined to maintain order within the law. I am a President elected by the people who relies on the law. I am going to end this type of extremist intolerance, but not in order to protect the wealth of the rich in Peru. When I had acted forcefully, people from the middle-class telephoned me to congratulate me. They thought that I was defending society from communist extremism in order to safeguard their wealth. You can be sure that they are in for a big surprise.

AG: *I believe there was a demand from some senior members of the Socialist International that you should set up an international commission of inquiry and not rely entirely on Peruvian procedures of investigation, but you refused to agree to the demand.*

GARCÍA: I don't like imperialism in any sphere.

AG: *I have heard some people say that Alan García came to power on a programme of humanity, Christianity and democracy, but he is relying on the military to eliminate the Sendero Luminoso. The army and the navy were unhappy because some of their officers had been killed and once you gave them the order to put down the riots in the prisons they proceeded to liquidate the rebellion. Is it possible that because of the Socialist International Congress and world attention you over-reacted?*

GARCÍA: No. I could be accused of over-reaction if I had given the orders without recourse to negotiations and concessions. Today, if it were to happen again, I would do it again. I *will* do it again because I have the law in my hands and the law must not be allowed to be weakened or violated. On that there should be no misunderstanding.

The military are used to the idea that democracy means weakness. They think that transition to democracy only promotes disorder leading eventually to fascism. My message to the military is that we know how to be strong in democracy and that we don't need them.

AG: *You say there are only two thousand people who are causing all the trouble. In your inaugural speech of 28 July last year, you said that 'there is a minority that attributes to itself a sense of history'. That could not refer to a couple of thousand misguided people.*

GARCÍA: Let me clarify. Peru has 20 million inhabitants and the 2000 people who sympathise with this movement, which has only 100 or 200 activists, are a very small minority compared to the overall population.

AG: *Do you feel you have licked the problem or will it intensify?*

GARCÍA: A situation of criminality will continue. This will not be aggravated by the action taken to curb the situation in the prisons. They calculate that there will be a long war in which the democratic system will be worn down.

AG: *Is this problem taking up a lot of your time and energy?*

GARCÍA: It is. Confronting intolerance is the greatest problem.

AG: *How do you propose to disentangle yourself from this?*

GARCÍA: I cannot disentangle myself from this problem. It is a reality. A lone person can blow up a train as happened yesterday, or a plane, but here there are one or two hundred of them. We have to assume and be prepared that they will go on doing what they have been doing for the last year.

AG: *The world has got the impression that human rights have been seriously violated. This was also suggested by the Peruvian novelist Mario Vargas Llosa.*

GARCÍA: Did you see Vargas Llosa on television last night?

AG: *I did.*

GARCÍA: He has completely reversed his position. The world has to understand the true nature of the problem.

AG: *Mr President, when you came to office you said the international financial system is sustained by growing arms expenditure and accumulating external debt. And when you said you will pay no more than 10 per cent of export earnings toward debt-servicing you were warmly applauded by the people in Peru and in other indebted countries. Have you had much support for your position at the level of governments in Latin America?*

GARCÍA: Many people have given us moral support which is very important. Many countries have shown sympathy towards Peru. But sympathy is not a convertible asset and it is not enough to change the situation. It will be a long time before we are able to work together. Almost all of the governments of the Third World are clearly aware of the problem. But we are held back by a reverential fear of the past. In the future there will be more decisiveness. In the meantime I am not going to sit and wait for the future. Peru will have to attend to its own affairs.

without waiting. If they are going to introduce sanctions against Peru, financially, economically or commercially, we will face the situation. It will prove that it is possible for nations to take independent decisions in their own interests and that in the future we must work together.

AG: *Do you sometimes get a feeling of being isolated?*

GARCÍA: Isolated? No, I don't feel isolated. Morally we are not alone. But, on a more mundane level, at the level of dealing with the IMF and the banks, we are isolated.

AG: *Many Presidents and Prime Ministers in the Third World were very happy when you said no more than 10 per cent of exports for debt-servicing but they were more happy that they didn't have to say it.*

GARCÍA: I know, I understand.

AG: *You suggest that Third World governments are all aware of the problem. Why is it that so many of them adopt a supine attitude when it comes to dealing with the IMF?*

GARCÍA: I cannot comment on the conduct of other governments. Everyone has a specific situation. Each leader has to contend with domestic public opinion, and decide how best to deal with their problems.

AG: *Do you think, Mr President, you might still get a debtors' alliance?*

GARCÍA: Not for the moment. Maybe later.

AG: *So on the 15 August when the IMF asks you to pay \$190 million to them, what will be your reply?*

GARCÍA: God alone knows. But we will cross that bridge when we come to it.

AG: *On the question of arms expenditure are you likely to persuade other governments in Latin America to agree to a policy of substantial arms reductions?*

GARCÍA: There are many signs and expressions of goodwill. But so far as we are concerned we have taken specific measures to cut down military expenditure. We did not tell our neighbours that we would stop buying planes if they agreed not to buy any more planes. That would have been childish. We just decided not to buy more planes. Period. That gave us a better moral position.

When we came to power, Peru had to pay more than a thousand million dollars for planes, ships and arms. We said: 'How are we going to tell the banks we can't pay them if we go

on buying arms?' We had discussions for a whole year with a French bank and a French company to reduce the size of the order. And we were able to reduce it from twenty-six planes to twelve planes. We bought twelve planes in order not to forfeit the \$150 million which the previous government had already provided.

AG: *Mr President, what will you do with these twelve planes?*

GARCÍA: The air force will know what to do with them. Do you want to buy them?

AG: *I asked this question because so many countries go on buying planes without ever flying them in combat. They never fight wars, except in the Security Council. Why don't we solve our border disputes instead of piling up arms?*

GARCÍA: Because the world is stupid.

AG: *How do you propose to convert the world?*

GARCÍA: Today, it is almost impossible to invade another country. The country which is invaded admittedly comes under great stress. But the invading country has even more problems, economic and diplomatic. I think there is a very remote possibility that a war of invasion between any of the Latin American countries could ever take place. But as nations we cannot completely rule out the possibility of external conflict. Perhaps a dictatorship might, in a moment of madness, decide to invade Peru. Old historical problems might suddenly trigger off a conflict. Personally, I prefer the idea of a nation defending itself through its citizens; a Territorial Army organised by the people themselves would be much cheaper than buying planes. A plane costs \$34 million. Luckily our twelve planes cost us only \$20 million apiece because they were bought five years ago. A ship with missiles costs \$300 million. It is crazy. I was not elected to provide lucrative business to arms merchants. They offer huge commissions. I think there should be an international inquiry to see who gets the commissions and how much. It makes me laugh when a salesman comes and tells me: 'Chile bought this type of weapon from us, we can sell you this other type which is more effective.' I am appalled and I put them on the first plane out of the country. The arms industry is one of the most potent instruments of modern capitalism.

AG: *Mr President, some sixty-eight countries in the Third World are under military dictatorship of one kind or another. In Latin*

America there has been a powerful return to democratic rule, barring the pariahs, Chile and Paraguay. You have been in the forefront of this democratic transition. How do you see the forces of democracy getting strengthened in this region?

GARCÍA: Democracy would be stronger if it were a continental democracy. Democracy is not a one-country venture; the whole continent must unite to deal with the problem of imperialism. And so long as there is no economic integration in the continent democracies will remain weak. I hope that in this democratic current which is sweeping across the continent, the two countries you mention will also overcome dictatorship.

AG: *You talked of economic integration. The Third World had an opportunity of creating institutions of economic cooperation when they had the oil revenues. Yet all the oil exporting countries did was to hand over their 'surplus funds' to American and European banks and those funds are now our debt burden. Why have Third World leaders failed to create alliances, any institutions to bring about fundamental changes in the prevailing world order?*

GARCÍA: The increase in oil prices added to the wealth of some groups in some countries. It was an accident which created an illusion of power for a few people. That does not mean that those who had the power were aware of it. The integration of the Third World will come about through a revolutionary process. The rich never start a revolution. OPEC is a good example of how sudden wealth only creates a fantasy world for the beneficiaries. But that fantasy world crumbles whenever the capitalist system of the world knocks it on the head.

AG: *But then does the Third World have any leverage against the capitalist system?*

GARCÍA: Its power lies in unity and I am not talking of a general world-wide union of the Third World, but rather of the financing of smaller groups as in the case of Latin America. Without solid integration, no nation will be able to get away from the IMF or from the world market, or from imperialism. The only other way is to be always knocking on the door of the other world power as a supplicant. Peru proposed to become independent of imperialism without having to knock on anybody else's door. That's our aim. It would be easy to say: 'Let's finish with the IMF. Let's throw out the foreign

companies, and then we'll ask the Soviet Union to help us with technology and money'. But that would be a betrayal of the people of Latin America. In any case I don't think the Soviet Union has the resources to help us at the moment.

AG: *Do you think you might get up one fine morning and say, 'I am fed up with this external debt and I, Alan García, will not pay.'*

GARCÍA: No, because I am not immoral. He who borrows must repay. The debt was incurred on behalf of the country. Of course, the rich people of Peru have taken it all out in dollars, but that is our domestic problem. We recognise our debt, we protest against the conditions under which we are called upon to service it now, but the moral principle is that we are responsible for the repayment of our loans. The state of the weather will not affect our responsibility.

AG: *Where does morality come into this? Christianity rejected usury a long time ago, and the current form of interest charges is usury in its most compounded form.*

GARCÍA: Except that many of the lenders are good Christians now. It is a problem for Christianity. Let the Vatican decide.

AG: *How do you see the failure of Third World organisations, like the Non-Aligned Movement?*

GARCÍA: You cannot call it failure. The process of social change is much slower than changes in the life of an individual. I trust that there will emerge a nucleus of people who will address the historical imperatives of change. This will create a universal awareness of how to live together without economic sanctions. If not, the world will be heading for disaster.

AG: *In the meantime, the world has become a bi-polar world. There are only two nuclear powers, and the rest are only an anonymous collection of 'other nations'. The superpowers have imposed a kind of nuclear apartheid on all of us.*

GARCÍA: And economic apartheid.

AG: *Can the Third World exercise any pressure on these two giants?*

GARCÍA: By making decisions. In the UN there have been many discussions and conferences among Heads of State in order to reach agreements. While they wait to agree on something, nobody acts on his own. Peru does not wait for anybody else to act. When we decided not to pay more than 10 per cent of exports towards debt-servicing, I acted without waiting for

the others. Let the other governments reach their own conclusions, but in the meantime someone has to start.

AG: *In your first year what has been your greatest frustration and your greatest happiness?*

GARCÍA: My greatest frustration has been the cost of human life in the conflict between intolerance and the need for democracy to maintain peace and order. My greatest happiness is to have laid down the conditions to meet the threat of economic apartheid. Not only have we laid down the conditions, we propose to abide by them.

AG: *Are you worried that your authority as a democratic leader may have been impaired by the recent events in Lima?*

GARCÍA: Let us wait a few more years to see. I trust that gradually world opinion will understand the real position. If world opinion is going to be determined by newspaper headlines then I would be disappointed. And if, because of those headlines, people who sympathised with Peru stop having any feeling of sympathy for Peru, then I would conclude that they never had any sympathy—only curiosity.

Neil Kinnock

Neil Kinnock is the Leader of the British Labour Party.

He was born in Tredegar, Wales, on 28 March 1942 and educated at University College, Cardiff, where he gained a Diploma in Education, in addition to his BA in Industrial Relations and History. He joined the Labour Party at the age of fifteen and was Member of Parliament for Bedwellty from 1970 to 1983, since when he has been MP for Islwyn. Elected to the Labour Party National Executive in 1978, he was opposition spokesman on education from 1979 until his election as Party Leader by the Labour Party Annual Conference in October 1983.

Neil Kinnock has been an active and long-standing member of the Anti-Apartheid Movement, which he joined in 1960, and of the Campaign for Nuclear Disarmament (CND). He has also been active in the Socialist International, and since the beginning of 1985 alone has travelled to Ethiopia, India, Kenya, Mexico, Nicaragua and Tanzania. In assuming the Party Leadership, he undertook to make international and development issues central to the agenda of the Labour Party.

His publications include Wales and the Common Market (co-author) (1972); Facts to Beat Fantasies (1978); and Why Vote Labour? (1979).

Altaf Gauhar interviewed Neil Kinnock in London in June 1986.

AG: *You have just returned from India; to use Nye Bevan's phrase, did you see the twilight behind the urban illumination? Did you get to see the starving areas not too far away from the glittering capital? Did you see hunger—to use another Nye Bevan phrase—in head-on collision with feudalism?*

KINNOCK: *The contrasts of India hit you like a sledgehammer in the face; although I've seen poverty and all the evidences of underdevelopment in other parts of the world, I think it was the stark contrast between considerable affluence and the most dire poverty which both fascinated and depressed me about India. There are many many diversities in India—geographical, cultural, linguistic—and also there is the caste system which everybody is aware of. However, the greatest divisions that bore in upon me were (i) a very small number of extremely rich; (ii) a larger number, probably no more than a*

hundred million, who are doing quite well and are part of a developing nation; and (iii) a vast majority, some five or six hundred million who are clinging on to the margins of existence. I could pick out many instances but I mention just one. Everyone has heard of the pavement dwellers in Bombay and have seen their photographs and read about them. Yet, I don't believe one really understands what the term 'pavement dweller' actually means until you see at quarter past eleven at night, (especially when it is from the back of a comfortable American sedan car such as picked me up from the airport) the streets carpeted by bodies. It fills you with a sense of hopelessness at the size of the task. Then, the next morning you see people from voluntary groups and visit people who are residents themselves and who are tackling the problem from the sharpest end and actually overcoming it. Then, one gets a surge of hope based on the realisation that people are doing their damndest to deal with the problem; not just to contain it, but to actually get out of it, to break the cycle of deprivation. So, all the time there is this constant movement of responses between something near despair and something near inspiration. It's a mixture of that all the time. I think that that kind of consciousness exists amongst several people now in the Indian Government and I don't see it just as a public relations exercise. They are prepared to draw attention to it, to expose it and to set out the agenda for dealing with it. That applies not only at the Union level, but it applies at State level too. I think we should ally ourselves as far as is physically possible with such people at every level. From the people working in the community, development workers, people in the government right up to the top (both politicians and administrators) who actually want to follow a direct course for the promotion of development and the defeat of misery that afflicts the developing world. And I'm certain that with that combination of energy and resources, such a victory is possible.

AG: *Do I understand that you were very impressed by the fact that there were groups of social workers trying to tackle the problem? That you also noticed there were people inside the government who were trying to eradicate poverty? Do you really think that is enough to alter the social and economic*

and Rwanda (the Tutsi fleeing from the Hutu). Situations of general strife that produced refugees—Zaire (then the Congo) after independence, the Nigerian civil war, the fighting in Angola and Mozambique—also had their tribal dimensions, if not roots.

South Africa is a case apart. The 'influx control' or 'pass' laws control the internal movement of blacks to a degree unparalleled almost anywhere else; there have also been many forced transfers of population within the country and a substantial number of refugees. Regarding foreign travel, South African courts ruled in 1982 that access to a passport is a privilege rather than a right for both blacks and whites, and that the Minister of Internal Affairs can revoke any passport without giving cause and with no appeal. The exit of blacks is further limited by the requirement that those assigned to a 'homeland' use the homeland passport, which is not recognised anywhere else in the world and which many blacks refuse to use since it implies they are no longer South African citizens.

The African states that have adopted exit restrictions to stem the brain drain have not been engaged in ambitious programmes of restructuring and assimilation, and the refugees they have produced seem to be primarily explicable on the basis of tribal rivalries. Though this is admittedly related to nation-building, the element of coercion in the production of these refugees is much less clear. It should also be noted that the African performance in responding to refugees is better than that of any other area; the OAU definition of refugees is more inclusive than the standard UN definition, and the African record on granting asylum has by and large been very good.⁵²

As a historic area of immigration, Latin America has a strong tradition of free international movement. Since 1973, all but two Latin American states guaranteed the right to leave in their constitutions. In practice, there were a few limitations that went beyond those permitted by the Universal Declaration of Human Rights: clearances for exit permits, including sometimes a 'certificate of good behaviour', might be required, and a married woman might need her husband's consent.⁵³

A few states constituted general exceptions to this rule. Cuba's policy has varied, in accordance with internal considerations and the state of US-Cuban relations. Before the Grenada intervention in October 1983, the radical regime on that island made it difficult for some (especially political opponents) to leave the country. Nicaragua, under

⁵² Holborn, *op. cit.*, pp 182, 825-6; interview with UN refugee officials

⁵³ Jesus Rodriguez y Rodriguez, 'Amerique Latine', in Vasak and Luskotsky, *op. cit.*, pp 207-29

experience then there is a danger of skimming the surface. The other thing is that it isn't just money which is needed. Frequently and very obviously it is expertise of various kind, or commitment to particular forms of training. Effectively that means you could turn someone who has experience of an urban requirement or of a land problem into someone who has the technical competence and equipment to deal with these problems. And it is true throughout the developing areas of the world that the best way of progressing is to ensure a partnership between experience and expertise based on technical know-how: the trick is to match the two, preferably in the same person or in the same group of persons. That is where the possibilities of real development lie.

AG: *Do you see the United Kingdom playing a significant role in development? You have consistently criticised the present Government for 'de-internationalising', for walking out of UNESCO, for ignoring the ILO Conventions, for treating the UN as a 'talking shop', and for virtually silencing the North-South dialogue. As Prime Minister yourself, how would you make this country play an effective international role?*

KINNOCK: For the last twenty-five years, I have been arguing for the definition and pursuit of a distinctive role for Britain in world affairs. This becomes even more necessary under the present government than under previous Tory governments. Two generations ago, the kind of people who ran the British Government knew exactly where they were. They were the government at the head of an Empire and all the internal relationships were neat and orderly and all the superiorities and inferiorities were fixed. When those times changed, their successors weren't really very sure about where Britain stood. Some of them out of decent sentiment retained their commitment as genuine supporters of our international relationships with the Commonwealth; they also understood the realities of political and cultural relationships with the United States of America. And eventually they came to comprehend the linkage that we have with the remainder of Europe, though I don't think they have really started to think of themselves as 'Europeans' yet. Not that kind of people. There was, however, still a sort of limbo and into the limbo

moved Mrs Thatcher and her attitude which, in practice, now becomes manifested as fifty-first American State status. We are so closely dovetailed into the policies of a particular American administration, that in so many situations our necessary independence, and I'm not talking in any nationalistic way, has been given away. We have to find a different course and the argument I have been putting forward for a quarter of a century is that we should, first of all, have a realistic reappraisal of our size, our potential, our influence. One which doesn't understate any of these, but doesn't exaggerate them either. The truth is that we are a medium-sized economy among a small group of rich countries. We have had our fair share of incompetencies but we have more than a fair share of justice, and that is valued by the British people. We have a language which enables us to communicate with a large part of the world. And because of our geographical location and our political traditions and our political hopes, we are both related to the US and part of the European continent.

Now these are the realities. There is no need for undue pride in all this, but equally we don't need to build our relationships on deference. In other words we should act like 'grown-ups'. That entails evolving a foreign policy strategy based on four elements:

- first, trade: we have to earn a living, and nothing can remove that necessity.
- Secondly: cooperation and development; there is a moral obligation here and there is a material advantage in it also, but primarily I treat it as a moral obligation.
- Third: human rights; they are probably now more endangered and more easily subordinated in many ways than they have been at any time in the past simply because of the efficiency of weaponry and the ruthlessness of governments. Unless and until there are individual nations and groups of nations systematically working for the advancement of human rights they will be in constant jeopardy. I also believe that we safeguard our own liberties by adding to them, and one of the ways we add to them, of course, is to ensure that more people enjoy them. So that does mean having clearly defined

attitudes towards the sale of arms and towards trading relationships, that are at least in part and in some cases, wholly dependent, on civil rights attitudes and in some cases, human rights attitudes of particular governments.

- Fourth: the pursuit of disarmament and the resolution of conflicts by non-violent means. These are realistic goals which become more attainable as more countries engage in their pursuit.

Now the justification for all this is in part political and intellectual, but it is also highly practical. The world is a powder-keg and unless we address our foreign policy on these systematic lines and ensure that there is a relationship between the pursuit of all of these elements of policy we could be adding to world tension simply through our inactivity. That is the way I approach the problem and my colleagues are in very substantial agreement with that. It doesn't mean breaching current alliances; it doesn't mean pretending we are an island secure unto ourselves because patently we are not, but it does mean developing policies that are born of our time and for our time instead of chasing vapid delusions of what we used to be a very long time ago or what an element of our society used to be a long time ago. The other alternative is to let other people construct our foreign relationships for us. That I don't think we should allow.

AG: *Do you think the Reagan Administration would allow you as Prime Minister to move in that direction? You know what they think of your defence and foreign policies?*

KINNOCK: Yes. I think that the very fact of national sovereignty and that an increasing number of people in Europe share my attitudes, though not necessarily my politics, are factors which the Reagan Administration has to take into account. There is a major and possibly deliberate, though I am not entirely convinced of that, failure of understanding. And I don't offer that as a sort of balm. Amongst some parts of the American Administration there is a tendency to interpret criticism as ingratitude, but the more intelligent members who are better informed about European attitudes and attitudes in the rest of the world, understand that Europe is a continent mainly of mature and stable democracies where we value individual liberty, where totalitarianism is resisted by every means,

where millions of people have died in that cause and where the struggle for universal rights, civil rights or consumers' rights are not seen as movement towards totalitarianism. Many people in the American Administration understand that, and it is on that basis that we say there is no threat to the alliance, but there is a need for a modern definition of exactly where we stand in relation to everybody else and we will pursue that course. I don't expect there to be dancing in the streets of Washington at any of my views, but I have put them to the Americans and a lot of them do understand that a relationship based upon deference towards the US is a very unhealthy relationship. Ultimately, as with all such relationships, it results in contempt by those who are superior and resentment by those who are said to be inferior in the relationship. Harmony doesn't lie that way. Ultimately, conflict and disengagement comes out of that. A deferential relationship doesn't help at all; it is much better to have a candid friendship.

AG: *Take your position on disarmament. How can you possibly reconcile it with that of the present US Administration? The Americans hope that once you are in power they will be able to educate you and they rely on the whole history of Labour governments. Past Labour manifestos have not been particularly reliable guides to the practice of Labour governments. In 1951, Winston Churchill found a British atom bomb project moving towards its first test. The Labour government which gave way to Edward Heath in 1970 had a completed Polaris fleet and an active research effort, and before Mrs Thatcher came to office Labour had built the new Chevaline Warhead for the Polaris missiles, despite its excessive costs, and the groundwork for buying Trident had been completed. It was James Callaghan who more than doubled the number of long-range US F111 aircraft based in Britain. Plans were under way to bring cruise missiles. Do you, as the next Labour Prime Minister, seriously think you could tell the Americans to 'get the hell out'?*

KINNOCK: I'm not considering asking the Americans to 'get the hell out' of this country. We will be elected on the basis of our intention that we want to clear American bases in Britain of their nuclear weapons. Now for Britain to become a non-

nuclear weapon country is not to be the exception to the rule. There are other members of NATO who have never accommodated nuclear weapons and are not going to accommodate nuclear weapons. So we are not special in that respect; the thing that makes us special is that we currently do have a nuclear weapons system which is obsolescent, which is to be replaced at crippling cost to our defences by another nuclear weapons system. And we are going to stop that. We will fulfil our commitment to NATO and we will defend our own country effectively.

AG: *What if the Americans were to respond by withdrawing from NATO?*

KINNOCK: That would be cutting off noses to spite faces on a gigantic scale and I don't think that the American Administration is so lacking in maturity or strategic sense as to do that. Let me also say that suggestions of total withdrawal or detachment from NATO have come from commentators, but never from the Administration or any part of it. These policies I outline can only be pursued by a government elected by the British people. We understand that very well. We find there is increasing endorsement of our view in a variety of circumstances. One of the circumstances is the clarity with which we set out our policy and the way in which we are going to pursue it; that has both reassured the people and won support among them. Secondly, of course, there is the conjunction of the bombing in Libya by F111s launched from Britain which has concerned a great majority of British people about the nature of our relationship not with NATO but with the US. Thirdly, there was the tragedy of the explosion and emission from Chernobyl which has raised the level of public comprehension about the volatile and utterly uncontrollable nature of radioactive fall-out. This has made people think very deeply about what the implications would be of even a single nuclear explosion of a weapon anywhere between the Atlantic and the Urals. All these things coming together mean that people are realising that our foreign policy is much too important to be left to another country.

AG: *When you met the Soviet leader, Constantine Chernenko, in 1984 and the missile-for-missile deal was mentioned, American commentators found it unacceptable that a member*

of the Alliance should try to pull off a bilateral deal with the Soviet Union. The same idea has now been revived by Mr Gorbachev. Do you see the possibility of a bilateral arrangement on missiles between the Soviet Union and Britain?

INNOCK: Let me first say that neither Britain nor France has ever been to anyone's top conference table, certainly not within the last twenty-five years. What happened in Geneva a few months ago, and what is happening now in the exchange of messages, is the furthest extent to which bilateral relationships has reached. Now so far as our policy is concerned, Mr Chernenko made an offer back in 1984 for a missile-for-missile-deal. My response was that it was a step in the right direction but it needed a lot of further consideration. In the intervening period, I've put the idea forward in several places, such as the Socialist International conferences, that it would be sensible to have an arrangement of comparable missile-for-missile reductions, or equivalent reductions. Mr Gorbachev told a visiting all-party British Parliamentary Delegation in Moscow last week that he would make that offer to any British government. That is much the best way to approach the subject because we can't negotiate, we wouldn't seek to negotiate, whilst we were in Opposition. So I believe that there is a possibility of progress there, either as part of a continuing reduction of nuclear arms—which I hope will have started by the time we get into office—or as an inaugural step in that reduction, and a demonstration that a reduction in armaments is feasible, and doesn't result in advantage being taken by either side, for I don't think that will be possible. I'm sure even the Americans don't believe that any such arrangement will allow one side to take advantage of the other.

AG: *Turning to the current situation in South Africa. What is your position on sanctions? The Commonwealth Eminent Persons Group is too frightened of Mrs Thatcher to utter the word 'sanctions'. So are some of her partners in Europe. The blacks and the black states are asking for sanctions. In Harare, I asked Robert Mugabe: 'You will be hurt deeply through sanctions, why do you support comprehensive mandatory sanctions?' He said: 'For the simple reason that if it hurts the*

enemy I can mobilise my people. Driblets only hurt my people. They don't bother Pretoria.' It is absurd to argue that sanctions don't work, because they do. It is rather hypocritical to oppose sanctions out of sheer compassion for the blacks.

KINNOCK: It has never been a convincing argument.

AG: *How do you see the situation resolving itself?*

KINNOCK: I don't think this has ever been a convincing argument except when it comes from those few people who have a courageous record, who have stood up for the destruction of state racialism in South Africa; they genuinely have a right to the view that they cannot easily anticipate or tolerate the economic impact of sanctions. I don't agree with them, but I understand their position. That is not the position of so many people now preaching that we can't impose sanctions out of concern for black people. I've always held the view, and I've been involved in anti-apartheid activity now for twenty-six years or so, that it is really something of a choice between two evils. You either impose sanctions effectively and secure the abolition of apartheid and the great poison that goes with it—a poison that runs right throughout not just South Africa but Southern Africa—or you don't impose sanctions and the consequence is that the South African apartheid regime, in order to sustain itself, must impose increasing repression internally and increasing aggression externally. I wouldn't claim the gift of second sight; I think this has been obvious for nearly three decades. We don't have to look in a crystal ball now, as Bevan said, you can see it on a television screen any day of the week. And the place is boiling and it is boiling over. The choice is of pursuing a course of action that will conceivably inflict harm in the short term, or avoiding that course of action and having total chaos and bloodshed on an unimaginable scale in the medium term. We are not even considering the long-term implications. Consequently, a front-line state leader now says 'Look, these are the choices: that we either put up with the pressures that will come for a relatively limited period to pursue this objective, or we just sit and wait for the holocaust.' Nowadays, no one should need to be convinced that that is happening. This isn't science fiction, it is happening every day now. If people aren't impelled by their revulsion against apartheid, they should be

compelled on the grounds of practicality to understand that the Botha regime and any likely alternatives to that regime will only be influenced and impressed by the isolation of South Africa in any sphere. They never respond to bridge-building or accommodation or procedures for dilution.

At this moment, as we speak now, Botha is using his puppet Parliament to get an endorsement for draconian laws to prevent the exercise of civil rights. We had all been warned that this would be the use to which this so-called softening of apartheid would be put. That's in the nature of the regime. We've said over the years and say even more insistently now, the possibility of a non-violent resolution to the conflict is increasingly remote, and it is only sustained by the possibility of sanctions. That is tragically more true now than it has ever been before.

AG: *How can the South African government be made to change its ways?*

KINNOCK: It will be compelled by the practicalities of the situation. Some of the South African businessmen who met Oliver Tambo in Lusaka were there because they may have been impelled by moral decency, but what actually moved them from their offices in Cape Town, Pretoria and Johannesburg, to sit down around the table in Lusaka were the realities of the situation; a situation which can produce utter economic breakdown and a civil war on a vast scale, lasting for who knows how long. They don't want to live in those conditions; they don't want to bring their children up in those conditions. That is why they went there.

AG: *As Prime Minister, you would have no hesitation in imposing comprehensive mandatory sanctions from Day 1?*

KINNOCK: No, that will have to be done. I hope that by that stage it will be a strengthening of sanctions that already exist. Now, if I can use your words about the CEPG being afraid of Mrs Thatcher. This is the counter-productive nature of Mrs Thatcher's style. For five years or so in the European Economic Community, Mrs Thatcher used to come in, preach a sermon, throw a tantrum and eventually come out with something that could be described as 'Maggie's triumph' in newspaper headlines in Britain. If you examine the small print it was rarely true. Nevertheless in PR terms it was

effective. That is, until June 1985 when the EEC had a summit in Rome and they said 'We've heard this long enough, we're not going to budge and that's it.' Two of the people who were there I've subsequently spoken to, and one of them said he had no inhibitions about it being reported outside or being attributed to him; others I have also spoken to said that they just couldn't take it any more—Mrs Thatcher's attitude was getting ridiculous.

Now I think that something of that attitude exists in the Commonwealth now and it exists because when they met at Nassau, they haggled into the night; people from the black Commonwealth, people from the white Commonwealth, people from the developing areas of the Commonwealth, people from the developed Commonwealth. They had a common objective and eventually they came to an agreement that they understood Mrs Thatcher reluctantly accepted; that was to establish the Eminent Persons Group to take action if the EPG did not see satisfactory signs of improvement in the South African situation. Mrs Thatcher agreed to that and now the irritation arises: she was prepared to accept the EPG as long as it didn't go anywhere. But, of course, she was party to the whole agreement and not bits of it. We are now at the point where I'm sure, in the most felicitous way, the EPG will let her know straight down the line, that 'Up with this, they will not put.' There is no refuge here for a Prime Minister who last year endorsed an attitude towards South Africa and agreed to a set of policies to be pursued and now says that she did not really mean it. People don't like British Prime Ministers dealing like that; they don't think it's commendable and they don't think that it's worthy of Britain—and they are right.

AG: *Is there a role for Britain in the Middle East? Mrs Thatcher recently visited Israel and she regularly contacts Jordan. How would you proceed to disentangle the various strands?*

KINNOCK: Well, this is very difficult. I don't know if it's impossible. I never resign myself to impossibility. I don't think you can afford to do that. I believe that an effort to impose ourselves on the situation as an honest broker would end in tragedy. If there were sufficiently authoritative representatives of what could broadly be called the two sides in this dispute, although

if there were only two sides in this dispute life would be a lot easier, and if they had enough coincidence of view to say to us 'We are prepared to accept the idea of you promoting some kind of conciliation', then I think it would be ridiculous to refuse to have anything to do with it. What will come of it, I just don't see. The problem is the intractability of the situation. No settlement is possible if it fails to acknowledge the permanence and integrity of the State of Israel, and no settlement is possible without the direct inclusion of the representatives of the Palestinians, representatives who really do command support and respect. Now these are the intractables. And the very ingredients essential to any possibility of resolution are the very ingredients that make the mixture next to impossible to put together.

AG: *Do you think you could find authentic representatives of the Palestinians outside the PLO?*

KINNOCK: I think some of them could be from outside the PLO, but not all of them.

AG: *Would you exclude the PLO from negotiations?*

KINNOCK: Oh no, I don't see how the PLO can be excluded—there are a variety of forms in which they could be included but any strategem that insisted on their exclusion means that at the very best if there was any dialogue it would be a dialogue of the deaf. The most encouraging sign to some extent was the initiative attempted by King Hussein with the backing of President Mubarak and his mission to America; it was a pity that it all came to nothing. They were starting off from the most cautious and nominal position in the hope that over a period of time which did not have to be specified (rightly, in my view) they could build up sufficient movement toward some understanding. Now, one must go back to the beginning. I believe that in the nature of the Israeli democracy, and it is a democracy in a profound sense, a degree of freedom has got to be given to effective negotiators such as Shimon Peres to try and attain security. There is absolutely no possibility of somebody like Shimon Peres selling out Israeli interests. That is not going to happen. He would be the last one to do it. But he is in the most direct sense a man of the Middle East and he loves the place; he predominantly loves Israel of course, but it goes wider than

that, and with enough confidence in him and freedom for him there's a possibility somewhere there, but it is extremely vague. Anyone who talks in absolute terms in the context of the Middle East has just arrived from Mars.

The other thing is, of course, the attitude of the superpowers. There was a time when America saw the Middle East as a challenge to be resolved and made an effort in that direction. The current Administration sees it as a hinge of East-West relationships and treats the Middle East like that. I don't think that's at all helpful. Equally, there was a time when the Soviet Union saw the Middle East as an opportunity for establishing buffers for mischief-making, but it has now moved to the point, though not entirely, of seeing it as a problem to be resolved. What we need is a conjunction of thought between the superpowers, not saying 'The cauldron in the Middle East is a menace to the whole world as well as being a dreadful misery for the people who live there, and we've really got to get together, not in order to superimpose some settlement, but in order to encourage those over whom we have some influence to move towards that.' That might be asking for the moon, but there's enough pragmatism in the conduct of international relations to expect that to happen at some time. I can't see Britain having any prominent role in this; if we do have a role it would come if others directly involved should look around for a country that has not got overstrong alignments and is capable of acting with integrity by itself. I don't know if that day will come.

AG: *Your critics accuse you of verbosity, they find you intellectually lightweight, and they harp on your lack of experience, all of which I find very surprising. How are you going to get rid of these criticisms and make a success of your ideas?*

KINNOCK: Well, it is happening. But this criticism has not always been there. It really started since I've become Leader of the Labour Party. Before that they were ready to forgive just about all sins including my policies on education and a lot of other things because I could always make them laugh. Attempts to use humour since becoming the Party Leader have come to be seen as evidence of my being lightweight, so

I don't tell too many jokes now. But, really, they write all that stuff because they've got minds that are stuck in a groove about where you've come from, where you're educated, what kind of accent you've got and their peculiar views about the nature of something called 'experience', and something called 'bottle' and something called 'gravitas'. I find it irritating from time to time, but you have to persist and I persist.

AG: *Ian Gilmour said you had the gift of the unfortunate phrase. Drower, author of Neil Kinnock, The Path to Leadership, argues that it is a 'fatal under-estimation of the intelligence of the British electorate to assume that Kinnock's verbosity will be sufficient to win Labour a general election.'* The Guardian noted your 'fine Welsh sense of catastrophe' when you started a one-man campaign to improve the first-aid facilities for the people who work at the Palace of Westminster. Then there is that incident after the Falklands/Malvinas War when an angry member of an audience told you that Mrs Margaret Thatcher had shown great guts and you retorted: 'It is a pity that other people had to leave theirs on the ground of Goose Green in order to prove it.' The then Defence Secretary, Mr Michael Heseltine, said you were the 'self-appointed king of the gutter' to which you responded, 'If I was in the gutter, he would still be looking up at me from the sewer.'

KINNOCK: Well, you see they shift the goal post around a lot. They want a peculiar mixture of a politician being natural and unnatural—it is a constant invitation to posturing. It is unjust when it is levelled against me; it irritates me, but when it is levelled against the others, it outrages me because I can look after myself. It is just evidence of their narrowness and preconceptions. I suppose a shorthand for some of them, not all of them, is just plain old snobbery. I remember a meeting that I attended when I was about fifteen or sixteen in Abergavenny in South Wales. It's on the fringe of the industrial area, a beautiful town, and we've never had great strength there. Nye Bevan was due to speak at this meeting but because he was late the fort was being held by a number of other speakers, the last of whom and the most heroic of whom in many ways was Abergavenny's only Labour county councillor. Not a man of great scholarship, but a very worthy

character. He didn't sound his aitches too well and there was a bunch of Young Conservatives there who every time he dropped an aitch put it in, or every time he failed to sound the end of a word, they would put it in. I was at the back because I was a steward and the doors of this hall in Abergavenny opened and in came Bevan, whom we were waiting for and he stopped and he said 'No, let me get an idea of the meeting.' It was packed, and eventually, after about two or three minutes he walked to the front, and amidst loud applause and acclamation he got on to the stage. The old councillor concluded his remarks, got a polite clap and sat down. Bevan got up and said 'Mr Chairman, friends, I have to say that while I detest Toryism I don't detest all Tories, some of them are quite decent people; some of them are quite sensitive people; some of them are quite generous people, who are victims of their beliefs, so it could be fairly said that I don't hate Tories.' There was a titter running through the hall. 'But I do hate snobs!' And that was the last we heard from the Young Conservatives; it absolutely wiped them out, and I've got pretty much the same attitude—a lot of it is just silliness.

PETER FLYNN

Brazil: the politics of the Cruzado Plan

The Cruzado

The reaction to Brazil's Economic Stabilisation Programme, the so-called Cruzado Plan, of 28 February 1986, has mostly been favourable, both in Brazil and abroad. The Plan has been seen, for the most part, as bold, imaginative and decisive, based on sound economic theory, and set within a coherent strategy, which explicitly links stabilisation with plans for growth, while also paying more attention than in the past to the urgent demands for distribution. There has been praise, too, for the fine sense of timing in terms of its announcement, for its apparent respect for political realities and sensibilities, and for its concern to protect, as far as possible, from its immediate impact the poor, the working class and those most vulnerable in Brazilian society. The Plan has had, and has, its critics, but they have been relatively few.

Most comment, understandably enough, has focused on the technical aspects of the Plan and the theory on which they are based, on the monetary reform, the price freeze, the extensive de-indexation, its treatment of wages, of exchange rates and all the devices for attacking inflation. There has been much less discussion of the political implications of the Plan, even though, from the start, its survival and success have been recognised as depending more on the government's ability to sell it politically than on its intrinsic technical merits. In this respect, it is worth reflecting on how this bold, and very necessary, initiative chimes in with the politics of Brazil's 'New Republic', and what it implies, in particular, for the government of President José Sarney, and for those who may wish to take his place.

The Plan

First, something on the background to the Plan and what it tries to do. When it was announced, in Decree Law No. 2,283, it was designed to be, and was, a swift, unexpected shock to the whole system, a sharp punch to the jaw, or a right cross, which, by chance, is the slang meaning of *cruzado*. Only days previously, informed analysts had speculated that

de-indexation would probably come at some time in the year, but with no idea that the punch already was on the way.¹ The government and the authors of the Plan rightly claimed in subsequent debate that the package *had* to be delivered swiftly, without warning and without open discussion, so as to avoid immediate, panic-filled speculation, huge leaps in prices and other reactions which would have fuelled still further the swiftly rising inflation, and would have made the task of stabilisation even more difficult than before.² Certainly, the secrecy surrounding the Plan and its announcement was astonishing, not least in a system notorious for 'leaks' and inspired rumours. Preparations had been under way, in effect, since Dilson Funaro took over from Francisco Neves Dornelles as Minister of Finance in late August 1985, but, even on the eve of the announcement, only about fifteen people in the whole country knew what was being planned.³

Apart from the Minister of Finance and the Minister of Planning, João Sayad, the men mainly responsible for the package were an able group of young economists, mostly linked to the PUC, the Pontifical Catholic University, in Rio de Janeiro and to the University of Campinas in São Paulo.⁴ The economists behind the Plan were all tied in varying degrees to the PMDB (Party of the Brazilian Democratic Movement), which, after the long years of military-backed government, had come to power, albeit in tragic circumstances and considerable confusion, with the indirect election of Tancredo Neves in January 1985 and the government of the 'New Republic' in March 1985. Perhaps their main shared characteristic was a mistrust and rejection of monetarist analyses of the Brazilian economy, especially in terms of the causes and

¹ For speculation on the possibility of de-indexation at some time in the coming year see: *Senhor*, 25 February 1986, p. 34. For details on the choice of name for the new currency, which gave its more popular name to the Plan as a whole, see *ibid.*, 11 March 1986, p. 35.

² See, for example, the long interview with the economist Persio Arida (Special Secretary for Economic Affairs in the Finance Ministry), one of the small group of theorists behind the Plan, in *Senhor*, 25 March 1986. As he rightly says, had Sarney on Friday 28 February announced that he was starting a process which would culminate in a general price freeze, then prices would have tripled by Monday. As it was, after rumours began to spread on Thursday the 27th, some supermarkets paid employees double-time to work all through the night, marking up prices. In this respect, to criticise the package, as some people have done, for being authoritarian and non-democratic seems unrealistic and unfair.

³ For the immediate background see the interview with another key theorist, Luiz Gonzaga Belluzzo (Special Secretary for Economic and Social Coordination in Seplan, Secretariat of Planning), *Senhor*, 11 March 1986, pp. 32–8.

⁴ In addition to Belluzzo and Arida, those most associated with the new strategy were Francisco Lopes (PUC), André Lara Resende (Director of Public Debt in the Central Bank), João Manoel Cardoso de Mello (Special Adviser in the Finance Ministry), Luís Carlos Mendonça de Barros (Director in the Area of Capital Markets of the Central Bank), Andrea Calabi (General Secretary of Seplan) and Edmar Bacha (President of the Getúlio Vargas Foundation).

nature of inflation, and a consequent distrust of the IMF and of recipes which might help to maintain low rates of inflation, but which, in the case of Brazil, would do little other than deepen the recession, already further aggravated by the high cost of oil and unprecedentedly high interest rates. There was also a common belief that Brazil's foreign debt, while it must be honoured as far as possible, could not for long be allowed to drain off 4–5 per cent of Brazil's GDP. Different authors laid varying emphases on the remedies required, but there was an overall consensus on the need for a sharp, sudden action, such as a general freezing of prices, and for an end to generalised indexation, which might alleviate the symptoms of inflation in the short term, but which itself had become the powerful motor of even higher inflation rates. All these elements, and more, were to appear in the Cruzado Plan, with the additional features—mostly affecting, and trying to protect, wages and the working class—coming from the Minister of Labour, Almir Pazzianotto.⁵

The architects of the Plan had their first meeting on 10 September 1985, almost as Funaro took office, and worked consistently, but quietly, from then on, examining issues of monetary reform (largely the responsibility of Resende and Arida) of price freezes (led by Lopes) of de-indexation, interest rates, exchange rates, wages, and all the other changes deemed to be necessary; above all, the need to tackle 'inertial inflation', the vicious circle which was leading, slowly, perhaps, but inevitably, to the deadly corrosive of hyperinflation.⁶ Most of the group's work seems to have been completed quickly, but they were concerned not to provoke harmful shocks—in interest rates, for example—such as had followed the introduction of the Argentine *Plano Austral* on 15 May 1985.⁷ Both the authors of the Plan and the government were also keenly aware that the timing of the intervention must be right. One immediate cause for delay was the impact on Brazilian agriculture of the prolonged drought, which had hit food

⁵ See the very interesting interview with Pazzianotto, *Veja*, 5 March 1986.

⁶ Again for details see the Belluzzo interview, *Senhor*, 11 March 1986. The idea of 'inertial inflation' and the need for a sudden price freeze seems to have owed much to Francisco Lopes and André Lara Resende, *ibid.*, pp. 40–1. Criticism of indexation in these terms was not, of course, confined to economists of the left. A fierce critic, even in the later years of the military government, was Octávio Gouvêa Bulhões, Minister of Finance in the Castello Branco government, who, after introducing indexation, later became one of its sternest critics. See especially his long interview in *Veja*, 20 March 1985, pp. 5–8. Bulhões, speaking two days before Tancredo Neves was to take office, urged the need to end the monetary correction he had introduced, despite the risks entailed. The current deficit is due '... above all, to the transmission of past inflation to the future through the mechanism of monetary correction.'

For a useful break-down and comparison of the two Plans see *Senhor*, 11 March 1986, pp. 39–41.

supplies very severely towards the end of the year; there was evident advantage in introducing the package when the economy, more generally, could be seen to be on the upturn, which by late February 1986 was the case.

Meanwhile, Funaro's economic team prepared the way for the Cruzado Plan by introducing several important changes, the full significance of which was not perceived at the time. Some elements of the Plan were already contained in the programme of the PMDB, especially as it related to de-indexation, the price freeze and unemployment benefit.⁸ Other related measures were contained in the 1986-89 First National Development Plan of the New Republic and a complementary package of mainly short-term aims, which the government sent to Congress in November 1985. One overall objective was the reduction of the public deficit, again, in part, with an eye on the Argentine experience. Important in this respect were changes in the tax system, approved by Congress in December. The National Development Plan had shown that over the last decade the tax burden had declined from 25.9 per cent of GDP in 1970-74 to 23.6 per cent in 1980-84. The aim now was the recomposition of the gross tax burden through a series of reforms which, combined with cutbacks in expenditure and financial charges, would reduce the public deficit in 1986 and, in turn, limit the government's borrowing requirements, the growth of the internal debt and the pressure on interest rates.

The second important measure to pave the way for the Plan was the withdrawal of what was called the movement account (*conta movimento*) from the Banco do Brasil. From January 1986 operations carried out by the Banco do Brasil in the name of the National Treasury had to be based on specific, previously defined, resources. The Banco do Brasil now no longer had automatic access to Central Bank resources, so lost the right to issue money on the basis of its own autonomous decision. This autonomy, one of the peculiarities of the Brazilian monetary system, was recognised as having been a serious obstacle to the control and organisation of public finances.

Steps were also taken to fend off one of the possible dangers to the success of the Plan, namely, the impact on food prices of one of the worst droughts of the past forty years, which had hit the main

⁸ See the comments of Senator Fernando Henrique Cardoso in *Veja*, 5 March 1986, p. 36. Perhaps the most convenient summary of the Plan, which has parallel texts in Portuguese, English and Spanish, is: *Brasil: Programa de Estabilização Econômica*. (Economic Stabilisation Programme) Secretariat of Planning of the Presidency of the Republic, Brasília, 1986.

food-producing region of the country. Efforts were made to streamline the marketing and distribution systems, while a further US\$1 billion was made available for food imports in 1986. At the same time it was estimated that the worst effects of the drought should have worked themselves out by about February 1986, in so far as they had been anticipated and already were reflected in the prices of November, December and January 1986.⁹ Other changes, too, paved the way, unifying, for example, in November, on the basis of a single price index, the three basic adjustments of the economy—wages, monetary correction and exchange devaluation. Again, in January 1986, savings deposits were subjected to reserve requirements in the form of government bonds, pointing to a gradual reduction in interest rates, while, in February, the government introduced measures further to reduce consumer credit and curb the growth of aggregate demand.

The single aim of all these initiatives was to cut back the inflationary process as far as possible, to reduce it, in effect to its inertial component,¹⁰ which might more easily and speedily be tackled by the sharp, sudden shock, the cruzado which the government had up its sleeve. This careful, steady preparation was to pay dividends after 28 February. It also clearly showed how wrong were those critics at the time who saw the introduction of the Plan as a sudden decision by Sarney, panicked in late February 1986 by reports of projected inflation figures of 500–600 per cent, by a growing crisis in the PMDB, his own falling popularity, and the threat of direct elections in 1986 or 1987, under pressure from rival politicians, above all, Leonel Brizola. All these factors were there, and will be considered, but it is clear that the Cruzado Plan had been carefully prepared, being held in readiness till the moment was deemed to be right, which by late February 1986 it was.

One important factor favouring the introduction of the Plan by late February, which again marks off the Brazilian intervention from its predecessor, if not its exemplar, in Argentina in 1985, was the behaviour of the Brazilian economy, especially its stable balance-of-payments position and the help given by impulses from the world economy. In Argentina the Austral Plan of 1985 came after three years of recession and with an inflation rate of over 1000 per cent. The Cruzado Plan was announced when inflation was running at about 255 per cent, though projected to rise much higher, and after a year of

⁹ *Ibid.*, p 21.

¹⁰ *Programa*, *op. cit.*, pp 20–1.

remarkable growth and expansion. 1985 had seen a growth rate of 8.3 per cent, and an export surplus of US\$ 12.8 billion, the third largest in the world.¹¹ The authors of the Plan could confidently hope that in 1986 Brazil, for the fourth year in succession, would be able to generate a trade surplus of US\$12–13 billion. In this the country would be greatly helped, too, by the fall in oil prices, leading to a bill of perhaps US\$4 billion for energy imports in 1986,¹² as compared to one of US\$9 billion three years earlier. The fall in the price of the dollar and the fall in international interest rates also eased pressure on Brazil just as the stabilisation package was being introduced.

It was, in part, this confident performance which allowed Brazil to announce the Cruzado Plan without reference to the IMF, again emphasising that Brazil would set its own path, even if, subsequently, the course chosen might meet with IMF approval. In the same way, in handling the debt problem, the government was satisfied with the fact that it had been able to reduce the *spread*, without the IMF, at similar levels to Mexico and Venezuela with the IMF.¹³ Just as the new package was being announced, Brazilian negotiators managed to re-finance almost one-third of the debt (about US\$31 billion) under much better conditions than those obtained in 1982, 1983 and 1984. A meeting, in Washington, led by William Rhodes, fixed a rate of 1.125 per cent above *libor* for the foreign debt of the public sector and 1.25 per cent for debts in the private sector, despite Brazil's refusal to toe the IMF's line. Some economists and politicians thought that Brazil should have done even better in the light of regular payments already made and, at the same time, the authors of the Plan were emphatic that Brazil, whatever its export surpluses, could not go on transferring such an unprecedented quantity of resources abroad, and that some more satisfactory solution must be found.¹⁴ No country, they argued, at Brazil's stage of development, whatever the level of investment (which in Brazil, in any case, was too low) could continue to send abroad 5 per cent of GDP, as Brazil had done since 1984:

¹¹ For balance of payments 1984–86 see *Programa*, *op. cit.*, p. 30, Table I. For inflation rates, exchange rates and monetary correction 1983–February 1986, see *ibid.*, p. 36, Table IV.

¹² See the report by Robert Graham, *Financial Times* (London) 7 April 1986.

¹³ See the Belluzzo interview: *op. cit.*, p. 36. Also the article by Marizete Mudim, *ibid.*, pp. 29–31.

¹⁴ Mudim, *op. cit.*, p. 31. Belluzzo, *op. cit.*, p. 36. Arida, *op. cit.*, who notes this as the first success since September 1982: *Programa*, *op. cit.*, p. 29 and p. 31, Table III, National Accounts Statistics. For a useful account of attempts at stabilisation see Reinaldo Gonçalves, 'Brazil's search for stabilisation', *Third World Quarterly* 7(2) April 1985, p. 279—which shows clearly the difference between those efforts, in relation, for example, to the IMF and the Cruzado Plan

Therefore, this indispensable reduction in the outward transfers of resource requires external debt renegotiations of much wider scope. The limited system of rescheduling implemented in the last three years are simply inadequate.¹⁵

By late February the government had decided that the time was right to intervene. In an early morning televised speech, in the presence of all his ministers, President Sarney told an astonished nation of the measures being imposed, describing them as 'a life or death struggle against inflation . . .' 'We have run out of palliatives, the decision has been made. Now it's a question of carrying it through and winning . . .'¹⁶

The new Decree Law replaced the cruzeiro, which had been declining in value at the rate of nearly 0.5 per cent per day, with the cruzado (one cruzado to equal 1000 cruzeiros), which was to be a strong currency with fixed parity in relation to the US dollar, the rate of exchange being fixed for an indefinite period, at 13.84 cruzados. It ended generalised indexation, whereby all prices and wages had been corrected at varying intervals (wages every six months) in accordance with the rate of inflation. All prices were frozen, for an indefinite period, at the levels of 27 February 1986, with a list of maximum prices being issued to help this control. The President made it clear that the freeze would be strictly enforced. The value of National Treasury Bonds (ORTNs), which previously had changed monthly in accordance with inflation, was now fixed at 106.40 cruzados, not to be adjusted again for twelve months. Financial assets with maturities of less than one year could no longer be indexed, except for savings accounts (*cadernetas de poupança*), the time of service compensation (*Fundo de Garantia por Tempo de Serviço*) and other funds which directly benefited employees. These would now be adjusted quarterly on the basis of the Consumer Price Index.

Contracts which had been subject to periodic readjustments, such as wages, housing rents and mortgage payments (*prestações do Sistema Financeiro da Habitação*), were now to be converted on the basis of their average real value in the period between adjustments. Wages and other forms of labour-related incomes, as well as retirement benefits and pensions, were to be converted into cruzados on the basis of average real values over the last six months, the argument being that this would be fairer to workers who had not had their six-monthly adjustment almost on the eve of the decree, even though other groups might feel aggrieved.

¹⁵ *Programa*; op. cit., p. 29.

¹⁶ *Veja*, 5 March 1986, p. 22

While enforcing these adjustments, the government was sensitive to their impact on the workers of Brazil. The decree granted a wage rise of 8 per cent to all workers, but increased the minimum wage by 16 per cent. Wages were also to be increased automatically at any time when the Consumer Price Index reached 20 per cent ('sliding scale'). Again, at the time of wage negotiations between workers and employers, now to take place annually, workers would automatically be entitled to increases equivalent to 60 per cent of the inflation rate, with the other 40 per cent open to bargaining between workers and employers.¹⁷ Such negotiations, as distinct from the system in the past, were to be free, with no predetermined limits on wage rises. Finally, the decree introduced a system of unemployment benefit (*seguro-desemprego*) for workers dismissed without due cause or when a company closed down.

The general, overwhelming reaction to Sarney's announcement was an almost audible national sigh of relief, that someone, at last, was seriously trying to do something about inflation, but still with talk of growth and a refusal simply to accept recession and impose the costs of stabilisation directly on the wage-earners. All sectors of society welcomed the initiative: it was, in fact, difficult to oppose it, even for those groups and individuals who previously had been most critical of the President and his government.¹⁸ Among those least happy were the bankers and financiers, who had done so well out of inflation and monetary correction, and who at once tried to put some pressure on the government.¹⁹ On the other hand, the stock market in São Paulo immediately went up by 23.2 per cent on Tuesday, 4 March 1986, the biggest rise recorded since the heady 'miracle' days of 1971.²⁰ Reaction from the unions was mostly favourable, the leaders having to take account of the wildly popular support given to the plan by the mass of the people and to the explicit provisions in the scheme to give some

¹⁷ This provision, it should be noted, was not in the original decree. It was conceded just over two weeks later, on the decision of Sarney, as a concession to Pazzianotto, to help him in dealing with the trade unions. Funaro opposed it as a dangerous return to indexation. See below p. 1173-4.

¹⁸ For a typically enthusiastic reception see *Veja*, 5 March 1986, pp. 19-38. It speaks of Sarney's boldness ('the most courageous decision of his political career' (p. 19),) notes the degree of public support and how critics, especially in the PMDB, have been silenced. See, too, *Senhor*, 4 March 1986, which refers to 'extreme courage' and *ibid.*, 11 March, 1986, pp. 32-52, which examines the reaction of different groups of politicians, economists, bankers, industrialists and trade unions. The Latin America Regional Reports (Brazil), having referred, on 7 February, to recent editorials in the *Jornal do Brasil*, *Folha de São Paulo* and *Estado de São Paulo*, all critical of the government's inaction over inflation, notes the PMDB's enthusiasm for the new plan (14 March) and the political benefits for Sarney (25 April).

¹⁹ See *Veja*, 11 March 1986, pp. 43-5; also pp. 51-2 on the ending of 'overnight' and the blow to financial speculation. For the pressures from bankers see *ibid.*, p. 38.

²⁰ *Ibid.*

protection to the workers. J  r Meneguelli, president of CUT (Central   nica dos Trabalhadores) spoke rather wildly of the package having been designed '... to make easier the payment of the foreign debt at the cost of the worker',²¹ but also made a more telling point, in noting that the wage adjustment on the basis of *average* wages over six months would imply a real disadvantage for some workers, such as bank employees in S  o Paulo. He warned that Brazilian workers would unite in a general strike. Lula, by contrast, was relatively quiet, while Joaquim dos Santos Andrade (Joaquinz  o) president of CONCLAT (Confer  ncia Nacional das Classes Trabalhadores) seemed to express the more typical reaction: 'The package is about 97 per cent right, and the other 3 per cent we can try to put right ...'²²

Beyond all doubt, however, the popular response was one of warm, sometimes wild, enthusiasm, as people all over the country committed themselves to act as watchdogs, especially over price rises. They wore plastic lapel badges announcing '*Eu sou fiscal do Sarney*'; they sang the national anthem in supermarkets, denounced anyone found putting prices up, and even sacked some shops for breaking the rules. The authors of the Plan were perfectly frank in declaring that it could only succeed with the full support of the people of Brazil, that it had to be 'transparent' for all to see,²³ and Sarney in his speech to the nation pulled out all the stops. It was a performance in the full populist tradition, of heightened rhetoric and emotional appeals directly to the people over the heads of party and Congress. Rejecting the 'palliatives' of the past, he stressed, with more than a tinge of bathos: 'It was not for this that the inexplicable ways of destiny made me President of the Republic.'

It was an extraordinarily daring and dangerous appeal for direct popular support, remarkable in a man who less than two years previously had been president of the government party (PDS) and who had been identified, in the broadest sense, with the policies of the old regime, who had come to office through an act of chance, unelected and suffering from all the disadvantages of one who only recently had

²¹ *Senhor*, 4 March 1986, p. 34.

²² *Ibid.*, pp. 42-3.

²³ See the Belluzzo interview, *Senhor*, 11 March 1986, p. 34, where he says that democracy allows a new relationship between government and society, with government accepting the responsibility given to it in the campaign for direct elections (*diretas j  *). Also Arida, *op. cit.*, 25 March 1986, who says the participation of the people is fundamental to success, especially of more organised groups, such as the unions and the 'base communities' (*organiza  es de base*). Also *Programa* *op. cit.*, p. 29, ending by saying that the Plan can be successful 'With the confidence and support of Brazilian society ...'

changed sides.²⁴ It was an appeal made, too, when Sarney was under growing criticism both from the press and within his new party (PMDB) shortly after he had announced a distinctly right-wing ministry, largely made up of the PFL, at a time when all eyes were turned to the important elections to be held in November, and when there were ever louder demands for an early, direct election of a new President of the Republic. Everyone agreed that the success of the plan, and, perhaps, the political survival of the President, essentially depended not on its technical niceties, but on the quality of its political appeal. The Cruzado Plan was a political gamble. Would it succeed?

The politics

The regime crisis, 1983–84

To appreciate the position of President Sarney and his government by late February 1986, one must remember the extraordinary circumstances in which he came to power, the peculiar ups and downs of his first year in office which came to an end almost as the Plan was announced, and the longer process of slow 'redemocratisation' within which all this was set.²⁵ Right from the start, the Brazilian process of political 'relaxation' (*distensão*) or 'opening', had been conceived as state-directed and controlled, a further refinement in the country's long-established process of social and political control, in which the state was to dictate the pace, direction and extent of the *abertura* process. Two of the main architects of this movement from 1974 onwards were General Golbery do Couto e Silva and Senator Petrônio Portella, introducing at various times a whole series of *casuismos*, devices for slowing down or shifting the pace of political opening.²⁶ One

²⁴ For a rather untypical and unusually bitter comment, see Franklin de Oliveira: 'Delfino messiânico', *Senhor*, 11 March 1986, p. 67. Rejecting Sarney's claim to have made 'the greatest revolution in the history of the country', Oliveira insists that all he had done 'is to patch up [remender] Brazilian capitalism . . . taken to the point of insanity by a military dictatorship which, by commission or omission, . . . Sarney served devotedly for twenty years'.

²⁵ Much of the following section is taken from the current ESRC-financed project of Elizabeth Allen and Peter Flynn, 'Brazil: The State and Opposition 1978–85. Parties, Pressures and Policy Implications'.

²⁶ In two long interviews in September 1983 and July 1985, General Golbery explained to the researchers why he believed *abertura* was necessary and the nature of the opposition to it. The reasons included the need to end the growing corruption in civil and military circles and the need for more effective government, while opposition to the process was mainly seen as centred around retired officers entrenched in the business world, especially through their links to the 'intelligence community' and the security services.

feeling of genuine warmth towards the US for supporting South Korea with the sacrifice of thousands of young men and millions of dollars in aid. The US support for the 1960 student rebellion against Syngman Rhee—when the US Ambassador publicly stated his support for democracy and virtually ordered Rhee to step down—added to this perception. The escalation of tensions between President Park and successive US administrations during the 1970s over human rights, and the 'Koreagate' bribery scandal also served to underline the view that it was the Park dictatorship and not US interests that were at the core of Korea's problems.

But these illusions were to be shattered when the test of American commitment to democracy came in 1979 and 1980.

The political crisis of 1979

As popular dissatisfaction with the eighteen-year rule of Park Chung Hee increased and labour unrest grew in 1979, the political opposition gained visibility and strength. In May 1979, Kim Young Sam was elected as the new party chairman of the opposition New Democratic Party (NDP) after promising to fight for democratic reforms. Then in August, the workers' struggle burst into the headlines of the nation's normally censored press. Two hours after the midnight curfew on 11 August, 1,000 riot police raided the headquarters of the NDP, where 180 women workers of the YH Industrial Wig Company and 30 NDP members were in the second day of a sit-in to protest at the factory's closing. Many workers, NDP members, and reporters were badly beaten during the raid. A young woman, an executive member of the labour union, was killed. The incident was front-page news throughout South Korea for days.³

In early October President Park ousted Kim Young Sam from the National Assembly, ostensibly over his public appeal to the US to withdraw support from Park's dictatorial rule. Soon thereafter, students and dock workers led large demonstrations in Pusan, Kim's hometown; the unrest rapidly spread to the nearby Masan Free Export Zone. A few days later, on 26 October 1979, Park was assassinated by the director of the KCIA, who feared that Park's hard line against dissent was leading to a violent revolution.

Many Koreans rejoiced at the death of the dictator, and looked forward to an end to military rule, a new Constitution, and a

³ *Korea Herald* (Seoul) 12–15 August 1979.

both officially and through elements such as the *grupos de base*, or, again, from *associações de moradores* (residents' associations).³¹ These movements all came together in 1984, in the unprecedented demands for direct elections for the presidency, when millions of people took to the streets in peaceful demonstrations, insisting on *diretas já*. However, on 25 April 1984, the Dante Oliveira proposed constitutional amendment, needing a two-thirds majority in Congress, was defeated by 298 votes to 65, with 113 absent and, almost overnight, the cries for *diretas já* were silenced.

If silenced, their echoes still persisted, above all, in the ears of the regime, as one must appreciate in order to understand the present position of Sarney. Interviews in Brazil from November 1982 to July 1983 clearly showed that perhaps the most striking effect of the elections of November was not on the opposition, but on the government's own party, the PDS.³² The elections had shown that the regime could no longer deliver the vote, could no longer, in the old English phrase, 'make a government'. The one figure who, to many PDS Congressmen, seemed able to offer hope was the former governor of São Paulo, Paulo Selim Maluf, who in 1978 had won the governorship against the regime's candidate and in 1982 had swept the board in his election as Federal Deputy. For the next two years Maluf and his presidential ambitions were to become one of the dominant features of national politics, leading to a crisis and split within the PDS, which would culminate in the indirect election of Tancredo Neves in January 1985.

One serious problem was the persistent refusal of President João Figueiredo to opt for any single PDS candidate. In early 1984 he would support none of half a dozen possible choices and by February, his Vice-President, Aureliano Chaves, was already making overtures to the PMDB. Soon after the Dante Oliveira amendment vote in April, some north-eastern governors, who previously had favoured the Minister of the Interior, Mário Andreazza, started approaching the PMDB governor of Minas Gerais, Tancredo Neves, who showed interest even in an indirect election. On 6 June 1984, Senator José Sarney, president

³¹ See Moreira Alves, *op. cit.*, especially pp 274-95, Tables A.9, A.10, and A.11 for the strikes of 1978, 1979 and 1980; also *ibid.*, pp 174-82. See, too, Scott Mainwaring, *Grass Roots Popular Movements and the Struggle for Democracy: Nova Iguaçu 1974-85*, Notre Dame, Indiana Kellogg Institute, University of Notre Dame, Working Papers No. 52, December 1985, and by the same author, *The Transition to Democracy in Brazil*, Kellogg Institute, Working Paper No. 66, March 1986.

³² This was especially true in interviews with Congressmen in Brasília. The PDS was in disarray, its members running for cover.

of the PDS, desperately trying to preserve party unity and to find an acceptable candidate, suggested a kind of primary election, but was howled down by Malufistas in the party meeting. On 11 June, Sarney resigned as president of the party. Events then moved very swiftly, Sarney meeting Ulysses Guimarães, president of the PMDB, on the very day after his resignation (12 June) and Tancredo Neves announcing on 15 June that, if approached by the PMDB, he would be willing to be candidate for the presidency. Other meetings were quickly arranged, with a 'Frente Liberal' (a dissident group within the PDS) binding themselves to a coalition with the opposition PMDB, in a new Democratic Alliance. They proposed as Tancredo's running-mate, Senator José Sarney, who was accepted only reluctantly by the left of the PMDB³³ in the party's convention of 12 August. On 11 August 1984, Maluf easily won the PDS nomination in its national convention by 493 votes to 350, but already it was a hollow victory.

What one is seeing here is the decomposition of a ruling bloc, of a party unable to resolve its internal differences and rivalries, pulled apart over the question of presidential succession. A substantial proportion of the leadership of the party refused to accept Maluf's imposition of his candidacy, even though he had strong rank and file support.³⁴ There was enormous pressure on Sarney, regarded with some bitterness in the PDS and unacceptable to many in the PMDB.³⁵ Many also believed that if Figueiredo had made a clear choice earlier, the crisis could have been avoided.³⁶ But by August 1984 important economic and financial interests already had opted for Tancredo Neves as the viable alternative

³³ The chronological details are important in explaining the pace and direction of these alliances. They include a meeting between Vice-President Aureliano Chaves and Governor Tancredo Neves in the Vice-Presidential Palácio do Jaburu on 1 July, a meeting between Aureliano and ex-President Ernesto Geisel (still a key figure in military as well as civilian politics) on 2 July, and a visit to Brasília on 6 August by Geisel, to talk to the President. On 14 August the alliance between the Frente Liberal and the PMDB was formalised as the agreement of the Palácio do Jaburu. For some of these moves see especially: G. Dimenstein *et al.*, *O Complot que elegeu Tancredo*, Rio de Janeiro, 1985. Also David Fleischer, 'Brazil at the Crossroads: The Elections of 1982 and 1985', (mimeo) San Diego, California: February 1985.

³⁴ The open quarrels became extremely bitter and personal, with charges and counter-charges of corruption being hurled in every direction, especially between Maluf and the governor of Bahia, Antônio Carlos Magalhães.

³⁵ In an interesting interview in September 1984, Senator Sarney explained to us how he and others had been able to make the shift in party and bring most of their base support with them.

³⁶ In an interview in Rio de Janeiro in 1985, Wellington Moreira Franco, PDS candidate for governor in 1982, explained how, with more determined and astute leadership, the Agreement of the Palácio do Jaburu could have been the pact of the Palácio da Alvorada – in other words, made within the PDS and the regime, not outside it.

to Maluf.³⁷ From September the bandwagon began to roll more quickly in a series of noisy public meetings (*comícios*) around the country and, on 15 January 1985, Tancredo Neves won by 480 votes to 180 in the Electoral College, with 17 abstentions and 9 voters absent, with Sarney as his Vice-President.³⁸

The candidate of 'conciliation'

If the original project of slow, controlled, state-directed *abertura* had to be interrupted and another candidate found, Tancredo Neves was the ideal choice. Tancredo's long career in Minas and national politics, his close association with Vargas, with Kubitschek, and with Goulart, made him acceptable to the left, but equally, his PSD background and his role in the PP in 1979–80, showed the confidence in which he was held by bankers, and entrepreneurs, men such as Herbert Levy and Olavo Setúbal in São Paulo, and even his old political rival, Magalhães Pinto, in Minas, who now gave him their backing.³⁹ Tancredo was the archetypal *mineiro* politician of *conciliação*,⁴⁰ acceptable to the left and to the right and to the military king-makers, such as Geisel. What was confidently expected of him in January 1985 was that he would

³⁷ In a fascinating interview in September 1984, one of the main author's of the programme of the Democratic Alliance, when asked about Tancredo's chances of winning, smiled, and asked in return whether we thought Tancredo would have given up the governorship of his home state, Minas Gerais, the job he had always wanted, unless his election were already guaranteed 'by us'.

³⁸ Both the PT and the PDT (Democratic Labour Party) expressed strong reservations about voting indirectly. During the meeting of the Electoral College, five of the eight PT deputies remained in a public hallway in the Congress building, denouncing the election as spurious. All PDT deputies but one voted for Tancredo, to defeat Maluf, but making it clear that his government must be 'provisional' with a Constituent Assembly to be called by, at the latest, November 1986. See *Jornal do Brasil*, 16 January 1985, and criticism in *Folha de São Paulo* of the same day, especially by Francisco de Oliveira, 'E agora transição.'

³⁹ Born in 1910, Tancredo, a lawyer, banker and academic was a cautious politician, tied closely to Juscelino Kubitschek and the PSD in his native state, Minas Gerais. Elected Federal Deputy in 1951, he became Minister of Justice under Vargas and always remained loyal to one thread in the Vargista tradition. He was defeated in the election for State Governor of Minas in 1960 by the UDN candidate, Magalhães Pinto, but became the first Prime Minister of the parliamentary regime, in 1961–2 under Goulart, and in 1963 the Chamber majority leader. He survived the coup of 1964, when others lost their political rights, but never compromised with the new regime, whose leaders mostly respected him. He joined the MDB, but in 1979–80 moved into the new PP (Partido Popular), the group especially favoured by entrepreneurs and bankers. In February 1982, under new pressures, he joined the PMDB and in November was elected Governor of Minas Gerais. For an especially useful discussion of his career, see *Folha de São Paulo*, 16 January 1985.

⁴⁰ See on this concept Michel Debrun, *A 'Conciliação' e outras estratégias*, São Paulo, 1983. One was not surprised to be told in an interview that Golbery do Couto e Silva had once remarked that if his strategy, for whatever reason, could not be carried through, Tancredo Neves would be the ideal fall-back candidate. It has not yet been possible to verify the report, but it is distinctly plausible.

guarantee the smooth transition between military and civilian rule, with wider popular legitimation than could have been expected for any other successor to Figueiredo who was not directly elected. A man of the right, yet with Vargista credentials, who had not compromised with the military regime, he was expected to guarantee the centre of politics and, at the same time, guide what increasingly was coming to be seen as the new 'party of government', the PMDB. Equally important, while doing this, he would avoid and exclude political extremes, above all, Leonel Brizola, as, indeed, he himself acknowledged in deliberately throwing down the gauntlet to Brizola on the eve of his planned inauguration on 14 March 1985.⁴¹

Tancredo would also, it was believed, guarantee and maintain the timetable for *abertura* with elections for mayors for capital cities and spas in November 1985, and for governors and Congress in November 1986. He would set about dismantling the repressive apparatus of the old regime and guide the country towards a Constituent Assembly, until, finally, the process was completed with a direct election of the President of the Republic. Then, on the Day of Tiradentes, the great *mineiro* hero (22 April 1985) Tancredo Neves died.

The challenge to Sarney

The public sorrow and compassion of the nation over the illness and death of Tancredo Neves had no parallel in Brazilian experience. His sudden illness, on the very eve of his inauguration, had a mobilising impact similar to that of *directus já*, increasing the popular emotional commitment to the ideal of the 'New Republic' which Tancredo had promised. His death also brought deep political trauma, especially in the PMDB and on the left, where, for many, the sudden loss of Tancredo was a nightmare come true. In the early days, which stretched to weeks, of confusion and sorrow, Ulysses Guimarães, president of the PMDB, played an important role in guaranteeing the succession of Sarney: but the problems were all too plain to see, as the new President still without full authority, struggled to make sense of a heterogeneous government composed, on an intricately personal basis, by Tancredo Neves.

Again, the details must be left to one side, but two key issues were immediately apparent: first, Sarney's standing and authority in his new party, the PMDB, and, secondly, his ability to control Congress. Like Quadros in 1960, here, suddenly, was a president without a party base,

⁴¹ By publicly criticising Brizola's choice of state secretaries

without clear party support in Congress and without the same authority and popular legitimacy as Tancredo to control the direction and timetable of *abertura*. Nor was it immediately evident that he would have the same basis of support among the business community, nor among the leaders of the armed forces, always nervous over sudden political disruption.

There was, inevitably, a lot of froth and bubble on the surface of politics over the next three to four months, with enormous time and energy spent on appointments at the *segunda escalão*, where, inevitably, *fisiologismo*, the eager scramble for post and position, showed all party groupings to their worst possible advantage. This was especially so in the PMDB. Sarney, between March and July 1985, the end of the Congressional session, was faced by a virtual revolt of the PMDB, despite all the efforts of Fernando Henrique Cardoso, appointed by Tancredo as 'Super-Whip' for both Chamber and Senate. Much of their revolt was petulant, bringing little credit to party or to Chamber, merely underlining the damage done to parliamentary practice in two decades of military control. But two issues were vital, and were to cost the PMDB dearly, and both related directly to the elections in November for *prefeito*, which Tancredo had wanted, but which, possibly, had he lived, he would have avoided. The two votes which came before Congress were, first, that mayors appointed by the elected governors in November 1982 should be eligible as candidates in November 1985, and, secondly, that the vote should be in *dois turnos*, so that a second election might be possible, if the first were to prove indecisive. If the first were allowed, then the appointed PMDB *prefeito* in São Paulo, Mário Covas, would be eligible to stand for election and almost certainly would win. If the second motion were passed, there was hope, from the PMDB's point of view, that at least a second vote, should it be necessary, might stop a victory of Brizola and his candidate in Rio, where already the PMDB was clearly in disarray. Both votes were a disaster for the PMDB, lost because of PMDB deputies, presumably unaware of the importance of the issues, and anxious only to defy a President and his close associates, not sensitive enough, as they thought, to their demand for preference.

By July 1985, in a series of interviews, mainly in Brasília, it was obvious how serious was the risk for the PMDB, above all, in São Paulo. In one memorable interview in Brasília, a wealthy businessman calmly explained how he and his colleagues would spend whatever was necessary in São Paulo to defeat Fernando Henrique Cardoso, the

al, if reluctant, candidate for mayor for the PMDB. The aim of this up on the right, the interviewee explained, was not so much to port Quadros (whom, he added, they would back no further than tion as mayor) as to damage the chances of Cardoso, both in São ilo and at a national level and, more immediately, to hit as severely as sible the national leadership and ambitions of Ulysses Guimarães l Franco Montoro and to help their own eventual presidential didate, Marco Maciel.

Already by July it was clear that a victory for Quadros in São Paulo l for Brizola in Rio de Janeiro would polarise Brazilian politics and severe harm to the PMDB. The media, enthusiastic in its support for doso, seemed not to have noticed that in November 1982 Quadros s remarkably successful in the ABC industrial towns of São Paulo, l, in a subsequent interview, even Cardoso himself admitted that he s surprised at the start of the campaign to learn of the degree of port for Quadros.⁴² In the end, Cardoso lost by only a narrow rgin⁴³ of 138,000 votes (3.4 per cent), Quadros taking 38 per cent. le the PMDB, as he rightly says, did well throughout the country. e overall result, nevertheless, was a severe blow for the PMDB and Cardoso. The elections also revealed the PT as a more important ional party than previously had been thought, even allowing for the ortions caused by the *voto vinculado* in 1982. Above all, the victory Saturnino Braga and his Vice-Prefeito, Jó Resende, in Rio de eiro, enormously strengthened the position of Brizola, especially en combined with victory in Rio Grande do Sul and his marked cess in other states.⁴⁴ Quadros elected in São Paulo, Brizola mphant in Rio, the PMDB tattered, divided and confused, all nted to precisely the polarisation of politics which Tancredo had ant to avoid.

The results in São Paulo particularly brought home the persistent ngth of the right. The appeal to São Paulo's 4.8 million electors was iced not only with Brazil's most wealthy state, but with the ntry as a whole. As Antônio Delfim Neto put it before the election: io is our hope of avoiding a PMDB take-over of the country.⁴⁵ l backed by such men as Delfim, Herbert Levy, Olavo Setúbal and,

ja, 6 November 1985, p. 36.

towards the end of the campaign, by Aureliano Chaves, Jânio Quadros was the hope of the right. The heads of some companies openly supported Cardoso, but the great weight of the business community, expressed through the PFL, was with Quadros.⁴⁶ In part the vote for Quadros was a vote against the government of Franco Montoro, but his victory essentially came from two quarters, from the most marginal and poor areas of the city, where his colourful, often wild, rhetoric seemed to have much appeal, and from the entrepreneurs, who saw success for Jânio as opening the way for Setúbal as governor in 1986 and for a PFL president of the Republic in 1988.⁴⁷ Leaders of the PMDB now became increasingly concerned over the resurgence of the right and, perhaps even more significantly, over the ability of the PMDB, both in São Paulo and nationally, to halt it.⁴⁸

The immediate polarisation of politics, as had been predictable in the event of victory both for Jânio in São Paulo and Saturnino Braga in Rio, was now around Jânio and Brizola, who both, after a quarter of a century, again found themselves at the centre of the political stage. One other person who emerged strengthened from the elections was Sarney, a fact stressed by some leaders of the PFL, such as Herbert Levy in São Paulo, who saw the President as freed from the pressure of more left-wing groups in the PMDB, and with more freedom of action: 'Sarney will now be able to form his own ministry.'⁴⁹

The need to work with the heterogeneous ministry composed by Tancredo Neves had become an increasingly evident disadvantage for Sarney in the months leading to the November elections, with contradictions and tensions, for instance, between Francisco Dornelles, an orthodox, conservative economist at the Ministry of Finance, trying to curb spending (as Tancredo had insisted in his inaugural speech) and João Sayad at Planning, stressing the need for growth and social spending. Aware of such tensions, of his lack of congressional base and of the mistrust of many in the PMDB, Sarney had attempted, like Quadros in the past, to appeal over the head of Congress directly to the people. One such, though maladroit, appeal was over the question of land reform, hoping for the direct support of the church. A victory for Cardoso and, in consequence, a strengthened PMDB, would have left

⁴⁶ *Veja*, 6 November 1985.

⁴⁷ *Veja*, 6 November 1985, pp. 36-41.

⁴⁸ This came out clearly in an interview in Rome with Fernando Henrique Cardoso in late January 1986, a view he later expressed more forcefully and publicly.

⁴⁹ *Veja*, 20 November 1985, pp. 43, 48-50.

even more the prisoner of the party. And Levy was right; the test would come in the new year, with the change of ministry. That change, when announced in February 1986, brought even deeper gloom to the PMDB. It seemed that Ulysses Guimarães, for example, had been pointedly ignored and humiliated, unable to gain acceptance for his candidates for Social Welfare and for Education, and unable to prevent the promotion of Marco Maciel to Casa Civil, now enormously strengthened in its command of resources and range of possibilities. The new ministry bristled with ex-UDNistas.⁵⁰ Apart from Sarney himself, they included Aureliano Chaves, Abreu Sodré, George Bornhausen, Antônio Carlos Magalhães and Aloísio Alves. Even some of the PMDB members, Paulo Brossard, was a former member of the liberal wing of the UDN. The PMDB was left, as some people had predicted, with some of the most difficult portfolios, those most likely to put them in the firing line. The two party members with greatest responsibility were Dilson Funaro, who continued in Finance, and Arnaldo Pazzianotto in the Ministry of Labour, but the president's overall attitude seemed to be expressed by the fact that Celso Furtado, at last brought into the government, was given the Cinderella post of Minister of Culture.⁵¹ The former Minister of Agriculture, Pedro Simon, expressed the feeling of many in the PMDB, when he said that the party would break with a government which only gives us the blame and not responsibility. . . .⁵²

The new Ministry reflected not only the 'Bossa Nova' UDN of Sarney's past,⁵³ with its close ties to the old PSD of Tancredo and Ulysses Guimarães, but a strong, clear preference for the PFL, especially in the greatly increased powers given to Marco Maciel in the Casa Civil. Formally, Maciel has more power than even Golbery had in the same job. On 19 February 1986, Sarney signed a decree conferring new powers on the Casa Civil, which, previously, was there simply to advise the President.⁵⁴ Now it has direct control of two of the most politically important funds in the country (Sarem) which, among other things, mediates the obligatory resources to states and *municípios* and

the journalist remarked that the ARI-NA men of the day before yesterday, the PDS men of yesterday, are now 'liberals' and continue in power -- even stronger than before. *Senhor*, 18 February 1986, p. 24.

determines the priorities of loans to state and municipal government; and of the FAS (Fundo de Assistência Social), through which the resources of the Caixa Econômica Federal are directed for the building of schools and other public buildings. But the new powers of the Casa Civil are even more extensive than this, leaving, for example, as someone said, the Minister of the Interior, Ronaldo Costa Couto, only with responsibility for Indians.

Some of the PMDB were partly appeased, for example, Miguel Arraes, who was pacified by being allowed the nomination of the head of SUDENE,⁵⁵ but the general reaction was one of shock and anger. The political composition of the new ministry at once gave further impetus to the move to form a new *frente esquerdista*, which already had been discussed in a meeting between Fernando Lyra (previously Minister of Justice), Pedro Simon (previously Agriculture), as representatives of the so-called *esquerda independente*, and Leonel Brizola.⁵⁶ Another who had shown some interest in this idea was the Minister of Labour, Almir Pazzianotto, who also had visited Brizola. In São Paulo, especially, the growing concern over the strength of the right brought new tensions in the PMDB, now firmly controlled by the Vice-Governor and candidate for Governor, Orestes Quéricia.⁵⁷ By the end of February it was clear that the tensions between Quéricia and other leaders of the party in São Paulo, notably Fernando Henrique Cardoso and Almir Pazzianotto, were widening. In an interview Cardoso stressed his concern to pull the PMDB further to the left, the only alternative at a national level being to join forces with Brizola,⁵⁸ and in March 1986 Brizola was delighted to go to São Paulo for a meeting at Cardoso's home.

The same tendency was apparent in Rio de Janeiro, where many in the PMDB were trying to decide between the Frente Progressista or the Aliança Democrática, essentially to join forces with Brizola or the PFL. There was talk of the PMDB mayor of Petrópolis, Paulo Rattes, moving towards the PDT, as well as one of the most respected party leaders in Rio, Arthur de Távola and, perhaps the greatest coup of all, Wellington Moreira Franco, PDS candidate for governor in 1982.⁵⁹ The

⁵⁵ Roberto Magalhães, Governor of Pernambuco (PFL), threatened to join forces with his arch-enemy Brizola, *ibid.*, pp 29–30.

⁵⁶ *Senhor*, 11 February 1986, p. 28.

⁵⁷ *Senhor*, 25 February 1986.

⁵⁸ Interview, Rome, January 1986. See, too, interview Fernando Henrique Cardoso, *Senhor*, 4 March 1986.

⁵⁹ *Senhor*, 25 February 1986, p. 32.

the party system was, evidently, enormously fluid, unstable and uncertain. By late February the PMDB was even seeking to distance itself formally from Sarney, especially in the run-up to November's elections, not wanting to be identified with such a conservative ministry. There was talk of a policy of non-alignment, of not automatically supporting the President. It was proposed that in the election of 4 March the leader of the *bancada* of the PMDB the person elected should be independent of the leader of the government in the Chamber.

When all was poised for confrontation, with Sarney looking politically more shaky than at any time since he took office,⁶⁰ suddenly, at the end of the month, came the Cruzado Plan, with its direct appeal to the people over the heads of party and Congress. The *caciques* of the PMDB were taken completely by surprise, with even Ulysses Guimarães learning of the new proposals only on the Thursday night.⁶¹ It now seemed that, in sharp contrast to the relatively right-wing ministry announced earlier in the month, Sarney was, in effect, committing himself to the PMDB, to a plan which contained a number of PMDB demands,⁶² drawn up by PMDB economists and depending for its success, in large part, on two PMDB ministers, Funaro and Zizianotto. The Plan, in this respect, tied Sarney to the PMDB rather than to the PFL in the crucial run up to the election, but, equally, at least in the short term, it tied the PMDB to the President. Some former members of his government could voice their criticism,⁶³ but those PMDB leaders who had been threatening withdrawal from the Democratic Alliance and no further support for Sarney, now had to back-pedal swiftly. There could be no immediate electoral mileage in losing Sarney, as was recognised by PMDB Congressmen, who immediately ended their planned revolt and, on 4 March, re-elected, as their leader in the Chamber, Pimenta da Veiga, with 143 out of 153 votes; the next day da Veiga happily accepted Sarney's invitation to be government leader as well. Funaro was given a long, standing ovation in

the two days before the announcement, Fernando Henrique Cardoso in an interview in the *Jornal do Brasil* had made one of the most scathing attacks so far by a PMDB leader on the government, declaring that the New Republic was really no different from the Old, and that the Democratic Alliance had broken up (see *Veja*, 5 March 1986, p. 36).

As Fernando Henrique Cardoso admitted, *ibid*. Even Federal Deputies further to the left, such as Alberto Goldman of the PCB (Brazilian Communist Party) and Haroldo Lima of the PC do B (Communist Party of Brazil) praised, for example, the attempt to protect wages, *ibid*. And, for instance, Francisco Dornelles, former Minister of Finance, 'The measures will profoundly affect the private sector, the financial system and wages. . . . Overall, the package is recession', *ibid*. p. 27. This, and other criticism quoted here, still contrasts sharply with the praise from other former Finance Ministers, such as Octavio Bulhões and Mario Henrique Simonsen, *ibid*.

the Chamber and Sarney was acknowledged to have made a remarkable, dramatic political recovery.⁶⁴ The immediate loser was recognised to be Brizola, whose thunder, in part, had been stolen and whose criticism of the new measures seemed to smack of peevishness or pique.⁶⁵ His basic criticism of the package, however, as to its effect on real wages, and the improbability of employers, businessmen, and the 'dominant classes' in general, cooperating with it over a long enough period, still remained to be answered.⁶⁶

After the Plan? The workers and the unions

Although he lost ground, even among some of his strongest supporters, many of whom were acting as Sarney's watchdogs in supermarkets, Brizola's criticism of the Plan showed, once again, his remarkable political instinct and his intuitive grasp of the realities of Brazilian politics. In the weeks that followed the introduction of the new measure, various sections of the working class, especially the CUT, voiced their disquiet at the impact on real wages. The leaders of CONCLAT met Sarney and Pazzianotto and expressed their support. One spokesman, Rogério Magri, said this support would be 'unlimited': 'if the package fails, it is not just the government that is in trouble, but the workers as well. . . .'⁶⁷ Joaquim dos Santos Andrade, national organiser of CONCLAT, said that, while the Plan hit the workers, it did contain items that helped them, for example, the price freeze and unemployment benefit. By contrast, Jaír Meneguelli, president of the CUT, which is linked to the PT, described the changes as 'confiscation', which could not be permitted, and Paulo Renato Paim, CUT's secretary-general, said that 'they have put their hands in our purse'.⁶⁸ DIEESE (Trade Union Department of Statistics and Socio-Economic

⁶⁴ On the eve of the Plan he strongly disclaimed any direct political interest, telling Ministers and advisers: 'You all know how I came to the presidency. I have no commitment to any political or economic group whatsoever and I am not a candidate for anything. What I do know is that Brazil needs a reform like this one. Let's get on with it. . . .' *Veja*, 5 March 1986.

⁶⁵ In the weeks leading up to the Plan, Brizola's supporters had grown more hopeful in their opposition to the government and their aim to reduce Sarney's mandate to three years. *Senhor*, 11 March 1986, pp 27-8. Brizola's television speech of 7 March was much criticised for being misinformed and opportunist. See, for example, *Veja*, 12 March 1986, pp 36-7. Also *Senhor*, 18 March 1986, pp 52-3.

⁶⁶ *Ibid.* Others, such as Fernando Henrique Cardoso, also commented that it would take some months for the success or failure of the Plan to be seen. *Veja*, 5 March 1986, p 39.: 'Either we'll be saved or we'll be in a similar situation to that of Argentina'.

⁶⁷ *Veja*, 12 March 1986, p 38. See, too, *Senhor*, 11 March 1986, pp 42-3.

⁶⁸ *Veja*, 12 March 1986, p 38. For severe criticism see the piece by Franklin de Oliveira, *Senhor*, 18 March 1986, p 73.

Studies) agreed with this, calculating that the conversion of wages from cruzeiros to cruzados, on the basis of average wages over the last six months, implied an average cut of about 20 per cent, while some workers, especially bank employees, were hit even harder. Their six-monthly adjustment, based on inflation, which was due in March, would have given a rise of 105 per cent: under the new law they obtained only 62 per cent.⁶⁹

Just before the Plan was announced, preparations were being made for a series of strikes, especially in São Paulo, and, only a week before the announcement, Meneguelli and the CUT drew up schemes for a general strike. However, one persistent weakness of trade union organisation and action in the recent past has been the division between CONCLAT and CUT, which has substantially reduced the unions' capacity for united protest. Their disagreement over how to respond to the Plan, coupled with Sarney's popularity because of it, his appeal to the people for support, and the measures to which CONCLAT referred, ruled out the chance of any immediate, vigorous response. When Luís Gushiken, president of the Bank Workers' Union of São Paulo, tried, on the night of 6 March, to organise a public protest over the impact on the bank workers' wages and the possible loss of jobs,⁷⁰ only a few dozen people turned up: 'Our people are confused and still don't see the truth hidden in this Decree Law'.⁷¹

Pressure from the unions, on the other hand, was sufficient to win from the government, on 17 March, the concession which decided that, at the time of wage negotiation, workers would automatically be allowed a rise equivalent to 60 per cent of the rate of inflation, with the other 40 per cent to be negotiated.⁷² This concession which finally was decided by Sarney, represented a victory for Pazzianotto and was seen as something of a set-back for Funaro,⁷³ in that it represented a return to

⁶⁹ *Veja*, 12 March 1986, p. 38. The question, it must be said, is not simple. One calculation suggests that, as from 1 March, in terms of the new law, the average wage will be less than in the past six months, only if inflation were to run at 2.5 per cent a month or more. For details and a useful table, see *Veja*, 19 March 1986, p. 42.

⁷⁰ Bankers, feeling themselves badly hit by the changes, spoke of the need for very substantial cuts in staff. See *Veja*, 12 March 1986, p. 30, and 19 March, pp. 52-3. Also *Brazil Information* No. 24, April-May 1986, p. 1.

⁷¹ *Veja*, 12 March 1986, p. 38. Meneguelli's doleful remark: 'Now, after the package, there is no climate in which to talk of a general strike', *ibid* p. 64.

⁷² Decree Law No. 2, 284. See above p. 1158 and Note 17.

⁷³ See *Veja*, 19 March 1986, pp. 42-5. 'Um passo para trás' ('A step backwards.'). Also *Senhor*, 18 March 1986, pp. 28-32. The conservative *Estado de São Paulo* said ironically that this new law confirmed the Sarney government's 'option for the poor', the phrase associated with 'liberation theology'.

indexation. Other authors of the Plan, such as Arida, also thought it too early to make changes, while others thought it of little importance. 'How much is 60 per cent of zero?', asked Calabi. But employers were dismayed, since the decree did not allow them automatically to pass on the guaranteed wage increase by a corresponding rise in prices. The key issue, clearly would be the rate of inflation.⁷⁴

The concession showed the government's awareness of the need to placate the unions. Pazzianotto was frank with his fellow ministers: 'I have an agreement with the union leadership and will have difficulty negotiating the package if I go back empty-handed. . . .'⁷⁵

However, even with the concession, the reaction of the CUT was different. Walter Barelli, technical director of DIEESE, still described the new version of the decree as a 'retrocession', saying that, previously, salaries were wholly adjusted, but now by little more than half, and the director of CUT in São Paulo, Heiguelberto Della Bella Navarro, was even more severe: '... It is even worse than the law of dictatorship which at least guaranteed 80 per cent of inflation. . . .'⁷⁶

One month after the announcement of the Plan, in the first week of April, there was a rash of strikes, even though in March prices actually fell by 1.4 per cent, the first price fall since 1931.⁷⁷ In Rio de Janeiro 140,000 teachers in state and municipal schools stopped work, and in São Paulo nearly 6,000 workers on the underground paralysed the system for three days. At the same time, bank workers promised to go on action the next week against banks which sacked workers in reaction to the Plan.⁷⁸ Workers in shoe factories in Franca, a city which exports US\$150,000 in shoes a year, organised a strike to protest against a loss of 25 per cent through the new measure. Telephone workers went on strike in Riberão Preto, while striking metalworkers of Honda Caloi in Manaus obtained a ruling from a judge of the Regional Labour Tribunal that the Constitution did not allow cuts in wages. Meneg

⁷⁴ See the comments of Luis Eulálio de Bueno Vidigal Filho, president of FIESP (Federation of Industries of the State of São Paulo), *ibid.* Another employer did note, however, that allowing prices to be passed on automatically did not mean they could not be passed on. 'The critics of the measure introduced yet another neologism, *pazzianotto*, meaning, for an attempt to destabilise the economy.'

⁷⁵ *Ibid.*, p. 45

⁷⁶ *Ibid.*

⁷⁷ *Vez*, 9 April 1986, p. 20. Also see the useful article *ibid.*, pp. 100-3, which examines these falls in detail. It suggests that preliminary estimates of the IBGE (Brazilian Institute of Geography and Statistics) put the fall at 1.8 per cent.

⁷⁸ Luis Gushiken in São Paulo claimed that over one hundred jobs a day were being lost in the city of São Paulo. Work, therefore, was stopped on the previous Friday in twenty-eight banks in the city and more disruption was promised, *ibid.*

head of the CUT, which represents 1,300 unions throughout the country, was quick to comment: 'This is the start of disillusion with the package . . . From now on mobilisation will tend to grow.'⁷⁹

Meneguelli is probably right, but there is still no sign, at the time of writing,⁸⁰ of serious working class or trade union protest:⁸¹ there is still widespread support for Sarney and the Plan. But relations with the unions and the question of wage negotiations is an issue which the government rightly sees as crucial to its success. The initial noisy enthusiasm already has faded and, while the people may find that their pay packets will buy much the same, or even slightly more, next month than this, they are also fully aware of how small those pay packets are. They may, indeed, be more aware than in the past, since indexation, with its twice-yearly adjustments, partly gave the illusion—for those in work—that things were improving. One Brazilian social scientist already has suggested that the end of inflation may even provoke rather than lessen social unrest, since in some respects it makes the workers realise even more clearly just how poor they are. The Plan, to be fair, was never presented as more than a stabilisation programme, but there is now a more urgent political need than ever before for the government to tackle the horrendous social problems of poverty and deprivation which it inherited from the post-1964 regime. Already Sarney and his team have accepted this responsibility, but the task is formidable.⁸²

Veja, 9 April 1986, p. 20. The teachers' strike in Rio de Janeiro was particularly embarrassing for Brizola and the mayor, Saturnino Braga, who had condemned the Plan for its depression of wages. The State Teachers' Centre (CEP) claimed that their wages, in Brazil's second richest state, were substantially lower than that of equivalent colleagues in Acre or Mato Grosso do Sul. A teacher starting work in one of the CEPs, the integrated schools, on which Brizola has lavished money and of which he is rightly proud, earned, it was claimed, less than the man on the nearby corner, the *apontador* of the *jogo do bicho* (animal game), a sort of 'bookie's runner'. Brizola, as with earlier strikes (of doctors, for example) refused to negotiate 'with a knife at my chest'. Interestingly, eight hundred parents in Nova Iguaçu, a Brizola stronghold, even though their children had lost their school meals because of the strike, organised a rally in support of the teachers.

Early June 1986. However by late May, one source did suggest that up to 600 strikes were being prepared. *Senhor*, 20 May 1986, p. 25.

One interesting development, which may help more effective organisation, was the appearance in late March of a new CGT (*Central Geral dos Trabalhadores*). The new organisation, which has been criticised, especially by the CUT, as a new way of presenting CONCLAT, has the stated aim of uniting the trade union movement. It has adopted the initials of the *Comando Geral dos Trabalhadores* of the 1960s, which put strong pressure on Goulart to introduce basic reforms and became a prime target after the coup of 1964. The PCB (Brazilian Communist Party), again made legal, was prominent in the CGT's congress in São Paulo state, attended by 6,000 workers. Cooperation between CUT and the CGT was achieved in late May during the debate in Congress on job security legislation (*Senhor*, 27 May 1986, p. 25), but it was hard to keep up. For a government statement of its aims and achievements in the first year of office, see 'Governo José Sarney—Ano. 1. O Brasil Mudou.' *Veja*, 19 March 1986. For a detailed study, again based

The 'classes dominantes'

Many people, the government included, shared Brizola's doubts about the probable reaction of bankers and financiers, industrialists, employers, the owners of supermarkets and those whom he called the *classes dominantes*. In public, virtually everyone, with the notable exception of the bankers and financial speculators, welcomed the Plan. In private, their views and behaviour were often different.

One fear, from the start, as prices were frozen, concerned supply (*abastecimento*), the danger of empty supermarket shelves, shortages, perhaps rationing, and consequent protest.⁸³ One of Brazil's biggest retail shop-owners, Arthur Sendas, president of Casa Sendas of Rio, thought a price freeze could only last a short time: 'If it continues for an indefinite period, within two months we will have shortages of all kinds of goods.'⁸⁴

Within a week of the Decree Law there were reports of such shortages throughout the whole country, sugar and rice in Brasília, eggs and vinegar in Rio de Janeiro, soap powder and tinned goods in São Paulo, and the press showed pictures of empty shelves, sometimes with notices blaming the suppliers. Often it was a matter of negotiating the price of supplies, as in the motor industry, where the factories refused to pay the price of parts because it included the inflation costs of February. The cause of the trouble, in many cases, was not a refusal to cooperate with the government, but simply the fact that it had frozen retail prices, but allowed suppliers and store owners to negotiate wholesale prices.⁸⁵ The problem ran right through the chain of supply. In the case of meat, for example, the beef farmers said they could not sell at the prices required, so the cold storage owners refused to buy and there was no meat in the shops. Funaro threatened that, if agreement were not reached, he would go for massive imports,⁸⁶ but then came a problem with rice. There were anomalies everywhere, with some products priced at less than the cost of production, and some costing more at a huge

distance away than they did at the place they were made.⁸⁷ Part of the problem was that no one was used to living without inflation. Previously costs were put up in anticipation of inflationary rises, and some people did not even know their production costs.⁸⁸ All kinds of dodges were tried, putting one cigarette less in the pack, selling underweight (often wildly) and, as always in Brazil, even if the government took offences seriously, the people found cause for laughter.⁸⁹

Despite shortages and price anomalies, there was a rush to buy, especially among the middle class who went on a spending spree⁹⁰ and, despite earlier fears, there seems to be relatively little evidence of deliberate attempts to sabotage the plan in terms of supply. There were, however, pressures from other quarters. Bankers, who had profited enormously from inflation, were aghast to find they had to survive on interest rates of between 2.3 and 3.7 per cent a month.⁹¹ Funaro, enjoying the general applause of the nation, found a cool reception on 14 March, when addressing Febraban (Brazilian Federation of Bank Associations⁹²). Instead of making concessions, which many of his audience had expected, he urged them to adjust to the new rules and try to trim their costs,⁹³ a message repeated by Sarney in a newspaper interview: 'The government is determined that the programme should not be sabotaged or boycotted . . . Whoever sets himself up against the programme will be overwhelmed by the will of the nation. . . .'⁹⁴

⁸⁷ *Ibid.*, 2 April 1986, p. 26. 'Bombril' (a kind of Brillo pad) was fixed at a price lower than the cost of production. A tin of Vienna sausages cost 6.64 cruzados in Santa Catarina (where it was made) but its price in Fortaleza, over 4,000 kilometres away, was fixed at 6.40.

⁸⁸ *Veja*, 2 April 1986, pp. 20-6.

⁸⁹ On Monday, 28 April, one of Brazil's most popular television comedians, Jo Soares, did a sketch as the 'Fiscal do Sarney' (the lady watch-dog of Sarney), indignant that a toilet roll which she had bought contained half a metre less than it should. He did not know, at the time, that over 1,500 kilometres to the south, in Rio Grande do Sul, the Federal Police had discovered that *Rom Dia* (Good Morning) toilet roll was 8 metres short in every roll (27 instead of 35). 'Just as well I warned them', said Jo.

⁹¹ *Veja*, 12 March 1986, p. 28. Especially see *Senhor*, 18 March 1986, pp. 57-60.

⁹² *Ibid.*, 19 March 1986, p. 36.

⁹³ *Ibid.*, pp. 52-3. The incoming president of Febraban, Antônio de Padua Rocha Diniz, asked the government to minimise the difficulties of 'transition'. Funaro replied that bankers must first show that they had done everything possible to cut costs. For other evidence of pressure from bankers and of government resistance, see *Senhor*, 11 March 1986, p. 38, and, especially, pp. 43-5.

⁹⁴ *O Globo*, 16 March 1986. In the first weeks after the announcement of the Plan the police were called upon to try to discover the source of waves of rumours, especially in Rio and São Paulo, of the imminent collapse of banks, especially when, in only two days in early March, more than 600 million cruzados were withdrawn from the Banco Itaú in São Paulo by frightened customers. Again, the government and the bankers had to give reassurances that no such threat existed. *Veja*, 19 March 1986, pp. 54-5.

The bankers continued to grumble and to exert pressure, but the was general agreement, at least in public, that painful adjustments were necessary. There were some exceptions, as, for instance, in the textile and clothing trade, which, as in Argentina, in response to the Austral Plan, now defied the Cruzado Plan, taking advantage of seasonal changes and shifts in fashion to put up prices by 16 per cent in March and by 5 per cent in the first week of April.⁹⁵ It was not, however, the price of dresses which made the difference; the real challenge lay elsewhere. The stock market, enjoying the biggest boom in years, suddenly was hit by a government decision that the pace of growth was too fast.⁹⁶ This provoked the comment that the most serious threat to the Plan lay within the government itself,⁹⁷ a subject which was now aired publicly pointing to tensions and sharply different priorities even among Sarney's own ministers. One analysis divided the 'saboteurs' of the Plan into five groups. First were the 'spending ministers', especially Íris Resende, Minister of Agriculture,⁹⁸ then Aureliano Chaves of Mines and Energy, José Reinaldo of Transport, Vicente Fialho of Irrigation and Deni Schwartz of Urban Development. A second group was made up of ministers who acted within government as the spokesmen of business interests, trying to win exceptions in particular cases to put up prices. The bankers came third, arguing that only higher interest rates could prevent the massive dismissal of employees, followed by certain politicians of both the PMDB and PFL, with their eyes fixed on the elections of 15 November, asking for special government help for clients or supporters. Finally, came the state governors, pressing, for example, for greater autonomy for their state banks in spending and making loans and, in effect to be exempted from the rigours of the Cruzado Plan. Resende was persistently pressing to allow higher prices, at one time for meat, at another for rice, and he wanted to spend heavily on, for example, development in Amazonas.⁹⁹ He had to be firmly resisted by Funaro, who was under constant pressure to end the freeze on prices. Aureliano Chaves was angry over the report which listed him among the 'saboteurs' or 'enemies of the package',¹⁰⁰ but the demands he was making for heavy state spending on, for example, Eletrobrás, asking for one billion and two hundred million dollars to cover its external debt and

⁹⁸ *Ibid.*, pp 20-5.

⁹⁹ *Ibid.*, p 22.

¹⁰⁰ *Senhor*, 6 May 1986, pp 30-2. 'Os inimigos do bom senso.' Also *Veja*, 30 April 1986, pp 22-3.

investments in 1986, were rightly regarded as fuelling inflation. He also, with other spending ministers, resisted government plans to impose tighter controls on his ministerial budget, because the changes suggested would lessen the political power and patronage of the ministry. He and other ministers joined forces with private interests to lobby their colleagues and, above all, the President. Often enough their demands were justified in terms of the job which needed to be done, as when Íris Resende urged the need to spend Cz\$70 billion on essential projects to stimulate agriculture.¹⁰¹ The Ministry of Fazenda, on the other hand, complained of ceaseless pressure from agricultural lobbies ('the meat lobby, the rice lobby, the maize lobby') all asking for money which could not be given. Aureliano Chaves drew criticism mainly because, as Minister of Mines and Energy, he headed a vast state within a state, containing some of the biggest and most expensive state companies within the economy. There was growing concern, in any case, over the size of the national deficit, to which state companies made such a contribution.¹⁰² The President and the defenders of the Cruzado Plan were all too aware that special treatment or concessions to one ministry could undo everything they were trying to achieve; but the pressures were increasingly strong, and ever more difficult to resist, with Brizola and other critics of the Plan waiting in the wings.¹⁰³

Sarney

Most of the pressure fell, and still rests, on Sarney, who has committed himself passionately to the success of the Plan and to whom, so far, it has brought rich political dividends. People noted the sense of mission with which he approached it ('This is my mission and I am going to carry it out'),¹⁰⁴ with the idea that destiny had worked in curious ways to bring him to the presidency for this purpose: '... a simple man brought by the caprice of life not only to this office, but also to take a decision which has generated the greatest economic change in the history of the country.'¹⁰⁵

¹⁰¹ *Ibid.*, pp 31-2.

¹⁰² On the problem of the deficit, which some people forecast could reach 5 per cent of GNP by the end of the year, see *Senhor*, 13 May 1986, pp 48-50. Funaro, again spoke of 'saboteurs' of the Plan and in an interview, on 7 May, said the government was doing everything to contain public spending. The state companies, it was estimated, were responsible for a deficit of 2.5 per cent of GNP. One result of the growing worry over the deficit was a quickening of plans to reform the banking system. Also on the deficit see the interview given by Minister João Sayad to *Jornal da Tarde*, 13 May 1986, and *Senhor*, 20 May 1986, pp 32-4.

¹⁰⁴ See the interview with the Minister of Justice, Paulo Brossard, *Veja* 12 March 1986, p 6.

¹⁰⁵ *Ibid.*, p 8.

A survey suggested that over 90 per cent of the population supported the stabilisation programme,¹⁰⁶ and, wherever he went, Sarney was warmly welcomed, as he spoke of the vital importance of the Plan and the need for popular support.¹⁰⁷ Comparisons were made, inevitably, with Brazil's most successful populist leader, Getúlio Vargas,¹⁰⁸ including the way in which Vargas used two different parties, the PSD and the PTB, to draw support from the conservative interior as well as support from the mass of urban workers. Sarney less than two years ago headed the PDS; in late March he became honorary president of the PMDB and, two weeks later, was made 'patron' of the PFL. This, in theory, brought him massive backing in Congress, since, in addition to the 252 deputies and senators of the PMDB and the 128 of the PFL, which made up the Democratic Alliance, he should be able to count on the help of the small *bancadas* of the PTB and of the Communist parties and of some of the PDS.¹⁰⁹ His support among the middle class was extremely high, with 82 per cent thinking that his government was very able and only 2 per cent thinking, after the Plan, that inflation would rise a lot, as compared to 51 per cent who thought so before its announcement.¹¹⁰ Some of the President's admirers argued that Tancredo Neves would not have had the imagination to launch the Plan,¹¹¹ while the resemblance to Getúlio Vargas was brought out even more strongly, when, on 1 May 1986, Sarney, flanked by Ulysses Guimarães and Pazzianotto, defined, in a televised speech, the social priorities of his government: 'We come to 1 May with head held high, able to shake hands with all the workers of Brazil.'¹¹²

He signed the regulation for unemployment benefit, promised to send soon to Congress a bill freeing those who were retired or living on pensions from the need to contribute to the social welfare fund and announced that, in future, a representative of the workers and the Minister of Labour would sit on the National Monetary Council (CMN) responsible for major economic policy. The scheme for unemployment

¹⁰⁶ *Veja*, 30 April 1986, p. 20.

¹⁰⁷ *Senhor*, 22 April, 1986. The President proudly announced on 15 May figures which showed that 72 per cent of all the television sets in the country were switched on for his speech of the night before.

¹⁰⁸ See, for example, José Bardawil, 'José "Getúlio" Sarney' (*Senhor*, 25 March 1986, pp. 37-8) stressing Sarney's growing control over the parties of the Democratic Alliance and his aim to strengthen his party support, perhaps by building his own party.

¹⁰⁹ *Veja*, 9 April 1986, p. 25.

¹¹⁰ See the survey of middle-class opinion reported in *Senhor*, 29 April 1986, pp. 36-8.

¹¹¹ Luis Gonzaga Belluzzo, *Veja*, 12 March 1986, p. 65.

¹¹² *Senhor*, 6 May 1986, pp. 32-4.

benefit was only a modest one and the representation on the Council mainly symbolic, but it was enough to allow it to be described as: 'the greatest advance in the social sphere since the labour laws brought in by Getúlio Vargas . . .'.¹¹³

Here was Sarney taking on Vargas's mantle of 'the father of the poor': 'The President's concern for history is evident. Having carried through the economic reform, Sarney is now going for social change. The next step . . . agrarian reform.'¹¹⁴

There were, at the same time, however, those who warned of the dangers of direct appeals to the people, of the tendency to neglect or disparage Congress, not just in the announcement of the stabilisation programme, which arguably had to be produced without warning, but, once again, in the case of this social legislation. Delfim Neto, warning of the dangers in terms of supply, added caustically that, in mobilising the people in support of the Plan, 'they have put a tiger in the streets. Now they have to watch out for it.'¹¹⁵ Even those generally in favour of the contents of the Plan were alarmed at the populist style. Instead of building and strengthening democratic processes and institutions, the 'New Republic' seemed to be stepping backwards, reverting to demagoguery and the cult of personality, with the President's emotional appeal for help leading directly to violence, the sacking of shops and bars and the unleashing of deep, long-nurtured dislike of shop-keepers and traders, associated in the past with rapidly rising prices.¹¹⁶ The content of Sarney's populism might be different from that of Quadros in São Paulo or Brizola in Rio de Janeiro,¹¹⁷ but the nature of the appeal

¹¹³ *Ibid.*, p. 33. —Unemployment benefit was to be 70 per cent of the minimum wage (Cr \$562.80) for workers who had earned, on average, 1.4 minimum wage (Cr \$1,125.60) in the three months before being unemployed, and 150 per cent of the minimum wage (Cr \$1,206.00) for those who were earning three minimum wages. Those who earned between 1.5 and three minimum wages would get 50 per cent of their basic pay (based on the average of the last three months, calculated by adding the wages for those three months and dividing by three.) Benefit would last for up to four months in any period of eighteen months, but would start only after seventy-five days of unemployment. Initially, this was to have been forty-five days, but there were fears of the impact on the deficit.

¹¹⁴ *Ibid.* See also Mauricio Dias, 'Sarney descobre o povo', *ibid.*, pp. 35–6.

¹¹⁵ *Veja*, 12 March 1986, p. 29.

¹¹⁶ See the very stern article by Elio Gaspari, 'A democracia dispensa xerifes', *Veja*, 12 March 1986, pp. 58–9.

¹¹⁷ See the comments of Uchôa Cavalcanti in M. Dias, *op. cit.*, *Senhor*, 6 May 1986, p. 36. He distinguishes between Sarney's attempt to find popular support for modern capitalism, aiming for modernisation and long-term growth, and Brizola's concern for redistribution of income and less social injustice. The distinguished lawyer, Raymundo Faoro, deplored the use of decree-laws (*ibid.*, p. 35), while Carlos Nelson Coutinho explained the force of Brizola's reaction to the *pacote* as stemming, in part, from the fact that Sarney was appealing precisely to Brizola's own constituency, 'the less organised sector of society', *ibid.*, p. 36.

was similar. One feature of it, in the case of Sarney, which alarmed many of those who hoped to see democracy strengthened in the 'New Republic', was the assumption that the President could be, and was, above party or group interest and therefore able to short-circuit the system when he chose.¹¹⁸ The Plan and Sarney's appeal to the people, in effect, subordinated party politics to the 'President's project',¹¹⁹ at once both reflecting and adding to the fragility of party politics after twenty-one years of military-backed government.¹²⁰

The parties

Of all the questions of Brazilian politics at the start of the 'New Republic' and in the wake of the Cruzado Plan, the question of the parties is one of the keenest. Brazilian experience has shown how much easier it is to damage than to rebuild a political system and the long years of military rule have left the party system, in particular, weak and in disarray. The elections of November 1982 led, as seen already, to a deep crisis and subsequent split in the PDS, and in Rio de Janeiro left the PMDB demoralised and under pressure from Brizola and the PDT. Especially in the first months of office, the PDT used most of its weight against the PMDB rather than the PDS, cutting resources, for instance, to PMDB mayors to persuade them to move into Brizola's camp. In São Paulo, by contrast, the PMDB emerged strengthened and confident from the elections of 1982, giving a lead to the party throughout the whole country, suggesting that in the years ahead the PMDB would probably become the natural 'party of government', democratic, reformist and somewhat left of centre.¹²¹ It was, however, easy to exaggerate the strength of the party, even in São Paulo, where it

¹¹⁸ See Sarney's own remark, p 1172, note 64 above.

¹¹⁹ *Senhor*, 6 May 1986, p 36.

¹²⁰ See *Veja*, 'O Sarney das multidões', 12 March 1986. Senator Alfonso Camargo of the PMDB said that, when the politicians who were leaving the field saw the team doing better they came running back after the ball 'which is with the President'. Deputy Cristina Tavares, PMDB, from Pernambuco, said: 'The President is above parties. . . . He has removed Ulysses Guimarães and Aureliano Chaves from decision-making and, personally, has assumed the centre of power . . .', *ibid.*, p 63-4. Raymundo Faoro, by contrast, said sudden shifts of this kind were typical of weak governments; strong governments had bases which held them fast, making their movements slower, *ibid.*

¹²¹ For useful material on the parties generally, see David V. Fleischer (ed), *Os Partidos Políticos no Brasil*, Brasília, 2 vols 1981. Also Robert Wesson and David Fleischer, *Brazil in Transition*, New York, 1983, and Fleischer, 'Brazil at the Crossroads: The Elections of 1982 and 1985', (*mimeo*) February 1985. For the PMDB and the election in São Paulo see Bolivar Lamounier and Judith Muszynski, 'São Paulo, 1982: A Vitória do (P)MDB', São Paulo, 1983. Also Morcira Alves, *op. cit.*, pp 220-30.

remained a broad heterogeneous coalition, still without clear definition of strategy or policy. The defeat of Senator Fernando Henrique Cardoso in November 1985 showed that the party machine could not of itself guarantee a candidate's success and the last six months have served to show still more clearly the fragility and confusion of party politics, even in São Paulo.

One of the currently most powerful and most ambitious of Brazilian politicians, Marco Maciel, head of the Casa Civil, commented earlier in the year that: 'Parties have practically disappeared. Today they are mere strings of letters (*siglas*) serving the interest of the candidate . . .'¹²² and there is general agreement as to the confusion of party labels, the weakness of party ties¹²³ and the ease with which people move from one party to another.¹²⁴ The '*pacote*', said one of Brazil's senior lawyers, stripped away the last disguises: ' . . . This is no longer a regime of parties or of Congress'¹²⁵

As the 'New Republic' prepares for vitally important elections in November 1986, especially that of the Constituent Assembly, the weakness and confusion of party politics, and the evident lack of respect for it on the part of some of the candidates, is a matter for concern.¹² The case of São Paulo illustrates the point.

It was generally thought that the victory of Quadros in 1985 would open the way for the candidacy for governorship in November 1986 of Olavo Setúbal, Sarney's Minister of Foreign Affairs, strongly backed by the PFL and elements of the business community,¹²⁷ who gave up the ministry in February in order to meet the electoral requirements. It seemed that, standing for the PFL, he would be opposed by Maluf for the PDS, Orestes Quércia, currently Vice-Governor, for the PMDB

¹²² *Veja*, 9 April 1986, p. 24.

¹²³ See the article by Eurico Figueiredo, *Senhor*, 8 April 1986, pp. 35-6. Also Cláudio Abramo, 'A maratona da insensatez', *ibid.* 6 May 1986, pp. 34-5.

¹²⁴ *idem*. See the article, 'A dança dos partidos'. The article particularly notes, for example, how José Alencar Furtado in Curitiba has left the PMDB, which he helped to found in 1979, having served the MDB for a dozen years, being *cassado* in 1977 (*Veja* says 1975) when leading the MDB in the Chamber (See Flynn, *op. cit.*, p. 512). He left to join the tiny Brazilian Municipal Party (PMB), formed two weeks earlier, saying that the PMDB had lost its direction. He apparently was joining forces with a group which intended to support the ex-mayor Jaime Lerner (PDT) for Senate, with the help of a former governor, Paulo Pimental (PDS) and a deputy from the PFL. The episode underlines the general point.

¹²⁵ Raymundo Faoro, quoted in *Senhor*, 6 May 1986, p. 35.

¹²⁶ As Fernando Henrique Cardoso put it in an interview in Rome in January 1986: 'How can you have democracy without political parties?'

¹²⁷ See the interview referred to on pp. 1166-7 above. Setúbal was a highly respected banker previously president of Banco Itaú, the former mayor of São Paulo and a leader of the short-lived PP, to which Tancredo Neves had belonged.

and by Eduardo Matarazzo Suplicy for the PT. But, only two weeks after leaving the Itamaraty, Setúbal announced on 2 March that he would not contest the governorship. It seems that, in part, he was wearied by the divisions within the PFL in São Paulo, partly caused by the sudden entrance of *políticos fisiológicos* (essentially, opportunistic office-seekers and Vicars of Bray), who had come into the party, especially from the PDS of Maluf.¹²⁸ His close associates and supporters, such as the banker, Herbert Levy, were suddenly without a candidate. Despite the PFL's support for Quadros in elections for mayor, there was now talk of one or both of the party factions moving towards the PMDB, an idea welcomed by Orestes Quércia and by Montoro.¹²⁹

The PMDB, on the other hand, had its own problems. The governor, Franco Montoro, had only just given full backing to the candidacy of his Vice-Governor, Quércia, who now was trying to restitch the Democratic Alliance in São Paulo, talking to Setúbal's main campaign director, José Bonifácio Coutinho Nogueira, to the former minister, Roberto Gusmão and to former governor, Paulo Egydio Martins.¹³⁰ At the same time, through Deputy Gastone Righi, leader of the PTB *bancada* in Congress, he was trying to mend fences in that direction, despite the problems this might cause on the left of his own party, where, indeed, Quércia's difficulties were substantial. The appearance of the Cruzado Plan had halted the shift towards Brizola of such PMDB leaders as Cardoso and Pazzianotto, but those on the left of the party were still concerned about the alarming lurch to the right of *paulista* politics following the victory of Quadros.¹³¹ Quércia was generally perceived as a 'machine' politician, who would do well in a party convention, but who would not necessarily win the support of more left-wing voters, many of whom, it was feared, might be drawn to the PT.

¹²⁸ *Senhor*, 11 March 1986, pp. 53-4. The party was divided between the Setúbal group and another around José Maria Marin, formerly of the PDS.

¹²⁹ *Ibid.*, p. 54. PFL national leaders such as Aureliano Chaves and Marco Maciel expressed their anxiety over the situation in São Paulo and the national president, Senator Guilherme Palmeira of Alagoas, flew to São Paulo to try to find a solution. He, however, had other worries, being severely criticised by colleagues who wanted to see him replaced by Paulino Cícero. Cícero is close to Aureliano Chaves and Palmeira to Maciel, so, again, it was part of a struggle for power within the party. See *Senhor*, 18 March 1986, p. 50.

¹³⁰ *Senhor*, 18 March 1986, p. 51. There was talk of a Senate seat for Setúbal.

¹³¹ Cardoso had expressed this fear in the interview in Rome, January 1986. See above p. 1170 and Note 58. Talking of the growth in strength of the right and the need to reshape and pull together the left of the party, he said that the only alternative might be to support Brizola.

Only two weeks after the excitement of the Cruzado Plan and the withdrawal of the candidacy of Setúbal, came a bombshell, the announcement by one of Brazil's most prominent businessmen and industrialists, Antônio Ermírio de Moraes, that he would be a candidate for the governorship of São Paulo. Antônio Ermírio was the head of Grupo Votorantim, the biggest private conglomerate in Brazil, made up of ninety-five firms, with wide-ranging interests in such areas as cement, steel, textiles and paper, with 55,000 employees in twenty states of the federation. Antonio Ermírio's personal fortune was estimated at about US\$275 million,¹³² but, while one of the most successful businessmen in Brazil, he was respected on the left for not having contributed to the DOI-CODI, the forces of repression under the military regime, and for his commitment to political transition. Despite being attracted to the PTB, which elected Quadros, he had not helped Quadros, instead publicly supporting Fernando Henrique Cardoso.¹³³ Impressed by the Cruzado Plan, he at once announced a reduction in the mark-ups, previously calculated to allow for inflation, throughout his companies and it seems that his admiration for the Plan and the reaction to it were factors in making him decide to enter politics.¹³⁴

Antônio Ermírio was also influenced in his decision by Robert Gusmão, who had resigned as Minister of Industry and Commerce early in the year, and who had been especially influential in helping Tancredo Neves to become President. Gusmão, who resigned from the PMDB, just as Antônio Ermírio's name was being put forward, had also been one of the strongest supporters of Setúbal's candidacy for the governorship, who, after deciding not to stand, after his defeat in the PFL convention of 2 March, tried to persuade Antônio Ermírio to do so.¹³⁵ Neither Sarney nor Montoro could openly support Antônio Ermírio, but other PMDB leaders, such as the Minister of Finance, Dilson Funaro, openly expressed their admiration.¹³⁶ Clearly, he was a candidate who would take votes from both left and right, from Quêrcia and Maluf, as both recognised, and he was the ideal candidate for many of the business community, who already saw him, at fifty-seven years

¹³² *Veja*, 26 March 1986, p. 37.

¹³³ *Senhor*, 25 March 1986, p. 30.

¹³⁴ *Ibid.*, 6 May 1986, p. 36.

¹³⁵ *Veja*, 26 March 1986, pp. 38–9. See, too, on Gusmão, *Senhor* 25 March 1986, pp. 31–2.

¹³⁶ *Ibid.* See also Roberto Santos, Minister of Health, 'Ermírio has all the qualities to head a good government in São Paulo.' Fernando Lyra, former Minister of Justice of Tancredo Neves, said he would be a real threat to the other candidates. Senator Carlos Chiarelli, leader of the PFL, praised his combination of modern capitalism and social concern, *ibid.*, p. 37. Sarney was said to be, at least, encouraging the candidacy. *Senhor*, 25 March 1986, p. 31

old (one year older than Sarney), a strong possible candidate for the presidency of the Republic. He could, in fact, have been in the first government of Tancredo Neves, but declined, just as in 1984 he had refused the invitation of Montoro to run as Tancredo's Vice-Presidential candidate, which, had he accepted, could already have brought him to the presidency.¹³⁷

Announcing his candidacy, Antônio Ermírio declared: 'In order to carry out the changes I believe are necessary for the country, I need a popular mandate.'¹³⁸ The one thing Antônio Ermírio lacked, however, for someone wanting a 'mandate' was a political party. He was *o candidato sem partido* ('The candidate without a party'),¹³⁹ a businessman who claimed to admire political parties, but not party politicians: 'I respect political parties, but the majority of them are under the control of professional politicians, only interested in the spoils of office [*só interessados na fisiologia*] . . .'¹⁴⁰

Another businessman, himself a prominent politician and a former governor of São Paulo, Paulo Egydio Martins, took up this point in an important interview, in which he explained why he preferred Quércio to Antônio Ermírio. One central point was the role which he thought the PMDB ought to play, especially in São Paulo: 'I believe that party discipline is fundamental to the existence of stable political institutions in our country, where the link with democracy and freedom is still very fragile . . .'¹⁴¹

The party, he argued, was more important than the man, so that, whatever the merits of Antônio Ermírio as a businessman, it was deeply alarming to see such a man, with no party links and no real political experience, parachuting into the midst of politics with such an impact; it presented a threat to the PMDB similar to the victory of Quadros in the election for mayor.¹⁴² Brazil, in the wake of the Cruzado Plan, trying hard to adjust, should not be looking for an 'ideal' or charismatic man (in the mould of Quadros) which was one of the alarming features of

¹³⁷ *Senhor*, 25 March 1986, p. 31. He also declined Sarney's invitation in February to become Minister of Foreign Affairs, *ibid.* For the build-up to his candidacy, see *ibid.*, pp. 31-2. Especially see the comments on opinion in the *Planalto*, that Sarney and his advisors were becoming increasingly anxious over the São Paulo succession question, seeing support growing for the PT and Maluf. The candidacy of Setúbal, in effect, had been torpedoed by the *malufista* group in the PFL in São Paulo and Quércio did not seem able to guarantee victory for the PMDB; hence the enthusiasm for Antônio Ermírio.

¹³⁸ *Veja*, 26 March 1986, p. 36.

¹³⁹ *Ibid.*, 1 April 1986, p. 30.

¹⁴⁰ *Veja*, 26 March 1986, p. 39.

¹⁴¹ *Senhor*, 15 April 1986, p. 5.

¹⁴² *Ibid.*, p. 6.

Antônio Ermírio: 'a man without party . . . When I see certain of his declarations, how he almost disparages parties, and his attempt to make direct contact with the people . . . this worries me . . .'¹⁴³ This was all too much like Jânio Quadros in 1961; hence Paulo Egydio's support for Quêrcia and the PMDB.

Paulo Egydio's points were well taken, expressing the anxiety of many people, not only in the PMDB, at the way in which a rich businessman, however able, and however liberal and impressive his record, could, overnight, jump into the middle of politics without a party base; however, it was with strong support among politicians and the electors in São Paulo¹⁴⁴ and even with the help, however tacit, of the government itself. Eventually, Antônio Ermírio found a party home, the PTB,¹⁴⁵ but the same problem of party weakness, instability and confusion was evident throughout the country. The PMDB in Recife had split before the elections for mayor in November 1985, with the election of the PMDB dissident, Jarbas Vasconcelos, for the PSB; now there were rumours of splits in Minas Gerais, where in 1985 the PMDB had soundly defeated the PFL of Aureliano Chaves.¹⁴⁶ The PFL was in difficulty everywhere, especially in finding candidates, and was busy patching up alliances with other parties against the common enemy, the PMDB.¹⁴⁷ Some of these alliances were quite startling, such as the possibility that Marco Maciel and the PFL might join forces with Brizola and the PDT to oppose the candidacy of Miguel Arraes and the PMDB in Pernambuco.¹⁴⁸

The one exception to all this, at least in São Paulo, was the PT, which,

¹⁴³ *Ibid.*, p. 7.

¹⁴⁴ By late April it was reported that he had more support in the industrial ABC towns than Quêrcia; *Senhor*, 22 April 1986. A survey for the *Folha de São Paulo* gave him 23 per cent of popular support, Quêrcia 13 per cent and Suplicy 10 per cent, *ibid.*, 29 April 1986, p. 26.

¹⁴⁵ *Senhor*, 29 April 1986, pp. 22, 26-31. Also *ibid.*, 6 May 1986, pp. 68-9. For some of the background to his choice see *Veja*, 2 April 1986, p. 32. Concerned at Quêrcia's difficulty in finding a candidate for Vice-Governor (Pazzianotto had refused the offer), some people in the PMDB even discussed the possibility of Antônio Ermírio becoming PMDB candidate for Governor, with Pazzianotto as Vice-Governor and Quêrcia as candidate for the Senate. See also *ibid.*, 9 April 1986, p. 24, where there is mention of Fernando Henrique Cardoso perhaps moving into the PSB (Partido Socialista Brasileiro), where he may more easily be able to help Antônio Ermírio against Quêrcia. The report also mentions, however, Antônio Ermírio's talks with Quadros. While all this was going on, Quêrcia was apparently threatening to move to the PDT with Brizola, unless he got full support!

¹⁴⁶ *Veja*, 9 April 1986, p. 25. There was talk of Senator Itamar Franco leaving the PMDB to run as Governor for the PL (Partido Liberal) and of the governor, Hélio Garcia, forming a new party after November 1986. See, too, *Senhor*, 6 May 1986, pp. 66-7.

¹⁴⁷ *Veja*, 9 April 1986, p. 25.

¹⁴⁸ *Senhor*, 13 April 1986, pp. 28-9; this mainly critical article on Maciel (pp. 26-30) emphasises how ambitious he is, especially in his bid to succeed Sarney.

faced with substantial opposition, still tried to preserve its party base, discipline and loyalty, while working to elaborate a coherent programme and electoral strategy. The choice of candidate was made, after hard but democratic debate, agreeing on the economist and PT federal deputy, Eduardo Matarazzo Suplicy, a member of the industrialist Matarazzo family and brother-in-law of the current Minister of Finance, Dilson Funaro. Suplicy was chosen in preference to another federal deputy, José Genoíno Neto, who in the 1970s was imprisoned as he was about to take part in the guerrilla movement in Araguaia,¹⁴⁹ and to Plínio de Arruda Sampaia, former deputy of the PDC (Partido Democrata Cristão), *cassado* (deprived of civil rights) in 1964 and now first *suplente* (substitute candidate) for the Federal Chamber. There seemed to be no rancour. The defeated candidates said: 'The PT is a democratic party. It's united and, if the people want Suplicy we will support him . . .'¹⁵⁰

The party in São Paulo actually welcomed the candidacy of Antônio Ermírio Moraes, as helping to make clearer to the electorate the conflict of interests between capital and labour. Antônio Ermírio would take votes from the other parties and strengthen the PT's position. He would separate the wheat from the chaff, Lula said. In the elections in November 1985 the PT was faced with the strong campaign of Fernando Henrique Cardoso, which attracted votes from PT supporters, swayed by the argument that they should not waste their votes on Suplicy, who had no real chance of victory, the idea of the *voto útil*. Now Lula argued, with Antônio Ermírio, 'the whole political picture in terms of the succession has changed greatly . . . to the benefit of the PT . . .'¹⁵¹

The Secretary-General of the party, Francisco Weffort, also believed that Suplicy could win, suggesting that he and Antônio Ermírio represented different class interests, one, the workers, the other, employers. Again, he noted the 'fragility of parties', especially the PMDB, which he described as a 'modern front' rather than a 'modern party',¹⁵² weak ideologically by comparison with the socialist commitment of the PT. Weffort also stressed the technical and administrative competence of the PT, but there were those who doubted whether, even if Suplicy were to do well, his opponents would

popularity remains very high, reinforced by the announcement of his social programme and by his declared intention to tackle the most intractable of all Brazil's economic problems, that of agrarian reform.¹⁵⁶ How successful he will be in this area remains to be seen, but so far the Plan has managed to cut back inflation without leading to recession, so that the main problem is, in fact, rather the opposite, the danger of overheating the economy.¹⁵⁷ Partly in response to shortages caused by the consumer boom, the government has had to lift its curb on imports, which however, it can afford to do.¹⁵⁸ Politically, too, the President is riding high, with the unions still presenting no real challenge, with the party system in disarray, especially the PMDB, of which until February he was virtually the prisoner. He may even find his position strengthened in São Paulo, if the PMDB's candidate is defeated in November. In a 'New Republic' which has returned so swiftly to populism, Sarney has emerged as the most successful of all the populists. His success has only to continue till November and he will have at hand a Congress, acting as a Constituent Assembly, in which his authority will be paramount. Is there, therefore, no source of political challenge to Sarney and the Cruzado Plan? The answer is, yes, if not perhaps in the short term, and that answer is called Brizola.

Brizola

At a time when it was highly unfashionable and politically unprofitable to criticise the Cruzado Plan, Brizola did so loudly and publicly,¹⁵⁹ and

¹⁵⁶ In 1985 160 people died in conflicts over land and a further eighty in only the first four months of 1986. The demand for agrarian reform has grown in volume, with powerful backing from the church. In its first year of office the government of the 'New Republic' dragged its feet. At the end of May the Minister of Agrarian Reform, Nelson Ribeiro, was replaced by Dante Oliveira and, in the wake of the much publicised murder of a priest in Sarney's own state, the government announced it would take tougher measures with landowners and speed up the pace of change. For an excellent survey of the problem see *Senhor*, 3 June 1986, pp 20-31. For earlier reports see 'Revolução no Campo', *Afinal* 19 March 1985, pp 35-41; 'Agricultura', *Visão*, 3 July 1985, pp 57-72; 'Os fazendeiros se armam', *Veja*, 19 June 1985, pp 20-6; 'Política Agrária do Regime Pós-64', IBASE, Rio de Janeiro, 1984, and *Veja*, 21 May 1986, pp 28-33 and 4 June, pp 44-7.

¹⁵⁷ See *Senhor*, 6 May 1986, p 33 and 13 May, p 24, which expresses alarm at the rise of inflation and *ibid.*, 20 May, suggesting that the Plan will need adjustments, probably in July. The article reports growing concern over the deficit and over illicit price rises.

¹⁵⁸ By late April Sarney's economic advisers were saying that some liberation of imports would be necessary. *Senhor*, 29 April 1986, pp 30-1. The plans for this were eventually announced in June. See *Financial Times*, 16 June 1986, which reports that restrictions are to be lifted on imports of several key agricultural and industrial products, in response to pressure from industrialists, food manufacturers and retailers, anxious to avoid short-falls and restore stocks.

¹⁵⁹ The rest of the left was much more cautious, even the PT, unwilling to be seen out of step with the popular enthusiasm. See, for example, the interview with Weffort, *Senhor*, 1 April 1986.

ground in consequence. Partly, as seen already, he attacked because Sarney was appealing to Brizola's own constituency, partly because Sarney's greatly increased popularity reduced the pressure for direct presidential elections before 1988, but also out of conviction that the Plan was not in the best interests of the workers and was an act of political opportunism.¹⁶⁰

The press, which has been, in general, so hostile to Brizola that he has had to buy space in it every week to reply to criticism and put his own message across, tends to exaggerate the damage done to him by the success of Sarney's intervention.¹⁶¹ In part, it reflects the wishful thinking of the middle class, especially in Rio de Janeiro. Many of them detest Brizola, whom they portray as an unscrupulously ambitious outsider, using the governorship only as a springboard for the presidency and doing great damage to the state in the process. Brizola is attacked as a *fazendeiro*, more often on his farm in Uruguay than in the interior of the state of Rio de Janeiro, an intolerant, authoritarian *caudilho*, who allows no participation in government and cannot stand criticism, still less strikes or opposition. The middle class accuse him of turning the city into another Calcutta, with beggars washing their clothes and themselves in public fountains, of reducing the transport system to chaos, of failing to collect rubbish, of doing nothing about rising crime, of neglecting the public health service, and of every form of maladministration, sacrificing everything to the building of his proposed five hundred or so *Brizolões*, the CIEPs or integrated schools.

There is some substance to these charges, though they go much too far. What is true, is that Brizola has made clear options within a coherent, though not carefully detailed, strategy. He is not an intellectual, not guided by theory or explicit ideology, but his priorities and policies are clear and consistent, as they have been for the last thirty years, since he was Mayor of Pôrto Alegre in the 1950s and Governor of Rio Grande do Sul from 1959 to 1963. As Governor, he created the Caixa Econômica Estadual and intervened to tighten up the banking system more generally; he encouraged investment to improve energy

¹⁶⁰ See the interview with Brizola, *Senhor*, 29 April 1986, p. 8, where he draws an historical parallel, noting that, within a year of Princess Isabel signing in 1888 the act which ended slavery, the monarchy fell.

¹⁶¹ Brizola, on the other hand, tends to exaggerate the hostility of the press. He is also extremely partial in his treatment of it, using it when he can, but regarding even the constructive criticism to be expected of a free press as an act of hostility. See the comments of Evandro Carlos de Andrade of *O Globo* and Marcos Sá Correia of *Jornal do Brasil*, *Senhor*, 6 April 1986, p. 44. Also *Afinal*, 4 September 1984, pp. 46-8.

resources, communications and transport, and caused a political uproar by bringing under state control a subsidiary of ITT. Above all, he gave priority to education, both primary and secondary.¹⁶² Brizola is fully within the tradition of Brazilian *trabalhismo*, which largely had its origins in Rio Grande do Sul. He is a tough, instinctive politician, with a feeling for what the people need and want, and with an extraordinary ability to communicate with the less privileged sections of society, whether in a speech in a public square, on television, which he uses with enormous success, or in writing, where he speaks to the people directly, simply and cogently.

The debate over the nature of the Brizola administration in Rio de Janeiro since March 1983 still goes on, and cannot be developed here.¹⁶³ The state is divided, often passionately, for or against him: not, in general, over his party, the PDT, but over Brizola who leads and defines and lends colour to the party. Despite the strictures of Tancredo Neves on the eve of his inauguration in March 1985,¹⁶⁴ Brizola has been especially well-served by some of his state secretaries, most notably, by his Secretary of Finance, César Maia, who brought order and discipline into state finances, despite the exceptionally hostile attitude of the federal government in holding back money due to the state. He is also extremely well-served by staff at lower levels of the administration, who have to do the dogged, often thankless, work in the *favelas*, in the schools, often disagreeing with certain features of Brizola's programme, often irritated, even appalled, by his style of government, but loyal to the basic ideal of his programme, a more equal distribution of resources and a better quality of life for the poor and underprivileged families, especially in urban Rio de Janeiro and the notoriously poor and violent *baixada fluminense*. Resources are thin, and, if spread more widely,

¹⁶² Studies of Brizola are few and rather weak. See, however, the useful entry in *Dicionário Histórico-Biográfico Brasileiro, 1930-83*, Vol. 1, Rio de Janeiro: 1984, p. 489. Also Moniz Bandeira, *Brizola e o Trabalhismo*, Rio de Janeiro, 1979; Lauro Schuch, *Para Onde Vai Brizola? Trabalhismo ou Socialismo*, Rio de Janeiro, 1983, and Cibília da Rocha Viana *Reformas de Base e a Política Nacionalista de Desenvolvimento—de Getúlio a Jango*, Rio de Janeiro: 1980. See especially, Elizabeth Allen, *Housing Programmes, Opposition Government, and the Move towards Democracy in Brazil: 1983-6*, Institute of Latin American Studies, University of Glasgow, Occasional Paper, 1986 (forthcoming). Allen notes how Brizola, as governor of Rio Grande do Sul, provided 6,302 new schools, 688,209 new pupils, and 42,153 new teachers.

¹⁶³ The ESRC research project referred to above is still in progress and the preliminary findings are just now being written up. For a useful, succinct, and generally fair, evaluation of the Brizola government see *Senhor*, 6 May 1986, pp. 37-60.

¹⁶⁴ Tancredo spoke disparagingly of the quality of Brizola's Secretariat. In reply, Brizola and his Secretaries decided not to attend the ceremony in Brasília.

would be thinner still. Therefore, they have been concentrated, especially in education and, to a lesser extent, in housing.

The middle classes howl, and damn Brizola, but the people vote for him and his candidates, as was seen in the overwhelming victory of Saturnino Braga and Jó Resende in Rio de Janeiro last November. In Rio, Saturnino Braga took 40 per cent of the votes, 1,059,629,¹⁶⁵ more than those of the other candidates put together. The PDT also won in Pôrto Alegre and came very close in Curitiba and Florianópolis and Recife.¹⁶⁶ Brizola still needs to consolidate his position in São Paulo, as he well knows,¹⁶⁷ but the PDT, though it has suffered some serious divisions and defections, has the potential ability to project itself at the national level, and to attract to itself powerful defectors from other parties, reacting against the growth of the right, as was seen in the few weeks before the announcement of the Cruzado Plan.

Here one touches the vital point. There are, at present, only two leaders of the left with genuinely national stature. Lula in São Paulo and Brizola in Rio de Janeiro. Of the two, Lula, it may be argued, is the more original, the stern, clear voice of working-class mobilisation, linked to a sharp analysis of the issues at stake. Brizola has counterbalancing qualities, above all, the ability to win votes: for this he is feared by the people in power even more than Lula. Interviews in the *favelas* of Rio de Janeiro and in the cities and townships of the *baixada fluminense* emphasise the political support for Brizola and his party, often referred to simply, as *o partido do povo* ('the party of the people'). The elections of November will be important for Brizola, and, if early surveys can be believed, his candidate has leeway to make up,¹⁶⁸ only partly because of the Cruzado Plan; but the elections of November 1986 will not be the end of the story: elections for president are still to come.

Sarney has gambled. Perhaps he has put himself into an unassailable position:¹⁶⁹ but in his gamble he has involved all those associated with

¹⁶⁵ *O Globo*, 18 November 1985.

¹⁶⁶ See Allen, *op. cit.* Also Maurício Dias 'As estocadas de Brizola', *Senhor*, 20 November 1985, pp 37-9 and *Veja*, 20 November 1985.

¹⁶⁷ See *Senhor*, 15 April 1986, pp 35-6.

¹⁶⁸ For discussion of some of Brizola's current difficulties see *Veja*, 21 May 1986, pp 26-7. Brizola is complaining of worse treatment by the federal government under Sarney than under Figueiredo. He says Sarney is holding back funds due to the state of Rio de Janeiro to make things more difficult in the period leading to the November elections. There have also been more defections from the PDT.

¹⁶⁹ One senior Brazilian diplomat recently suggested that, even if the Plan were to fail, Sarney may be above the criticism and blame which would follow. He was the President who tried, bravely, to bring in the necessary changes. Others must face the music.

North-South Monitor

and the Stockholm Conference on Confidence and Security Building Measures and Disarmament in Europe (CDE).

On regional issues, no agreement was registered except that of continuing the regular exchange of views at expert level on various regions. Such exchanges had already taken place on the Middle East, East Asia, South Africa, Central America and Afghanistan. Fundamental disagreements over Nicaragua were reported to have persisted at the summit, but George Shultz said that Afghanistan had been extensively discussed, despite its absence from the communiqué. Shultz reported that there had been a broad hint of future Soviet accommodation involving a political solution, and a schedule for the withdrawal of troops.⁷⁰ The sole reference to human rights was an agreement on 'the importance of resolving humanitarian cases in the spirit of cooperation', though the subject too was reported to have been extensively discussed.

Perhaps a major achievement of the summit was its attempt to institutionalise a 'process of dialogue' between the two powers, which would be intensified and regularised at various levels, including the holding of further summits. Mikhail Gorbachev accepted an invitation from President Reagan to visit the US in 1986, and it was agreed that the visit would be reciprocated in 1987. There would also be regular meetings at foreign minister level. Progress was made on other bilateral contacts, which had been halted by US Presidents Carter and Reagan in protest at the invasion of Afghanistan in 1979, and the imposition of martial law in Poland in 1981. The two foreign ministers signed a six-year agreement on cultural, educational and scientific contacts and exchanges, and agreed that these contacts should be expanded. The leaders agreed a set of measures to promote air safety on North Pacific routes to prevent such incidents as the shooting down of a Korean airliner by Soviet forces. Noting that negotiations had begun for the resumption of air services between the two countries, the two leaders agreed that their countries should simultaneously open Consulates-General in New York and Kiev (to supplement those already in existence in San Francisco and Leningrad). Further support was given to cooperative measures for the preservation of the environment, and to develop thermonuclear fusion as a source of energy.

Although no mention was made in the joint statement of the elimination of SDI as a precondition to agreeing on strategic arms control, Mikhail Gorbachev reiterated Soviet opposition to 'Star Wars' at a press conference following the summit.⁷¹ The Soviet Union, he said, was determined to keep up with the US if it persisted in its space weapons research. Both leaders emphasised that differences remained between the two powers, and that the summit's substantial achievement would depend on future actions, rather than on the statement of intent.⁷²

Following the summit, Mikhail Gorbachev attended a meeting of the Warsaw Pact in Prague on 22 November 1985. According to Tass, the official Soviet News Agency the six Pact leaders gave their full support to the Soviet position at the summit acknowledging that the problems of arms control had not been solved, but considering that the statement of intent not to pursue military superiority was of considerable value.⁷³ On the same day, before addressing the US Congress on the summit,⁷⁴ President Reagan briefed the NATO Council in Brussels. Lord Carrington, the NATO Secretary-General, reported that the President had referred to the summit in positive terms, and received support in return. Margaret Thatcher

The struggle for democracy in South Korea in the 1980s and the rise of anti-Americanism

In the first half of 1986, a series of events in South Korea captured the attention of the world press and marked a turning point in the history of that country's opposition movement:

- Early in the year, the opposition New Korea Democratic Party (NKDP) initiated a nationwide signature campaign and a series of mass rallies calling for a change in the 1980 Constitution and direct presidential elections. In a remarkable display of unity, the campaign gained the support of major religious and academic organisations, and the provincial rallies drew hundreds of thousands of ordinary citizens—the largest public demonstrations since General Chun Doo Hwan seized power in a military *coup d'état* on 17 May 1980.

- In mid-February, just as the campaign was taking off, the twenty-year rule of Ferdinand Marcos over the Philippines suddenly came to an end. This victory of 'people's power'—and the decision of the US President, Ronald Reagan, to support the new administration of President Corazon Aquino—forced Chun to back away from his staunch resistance to constitutional change. Just one day after Mr Marcos left Manila, Chun rescinded his order that all participants in the signature campaign be arrested, and the mass rallies began. Suddenly observers were asking: with Marcos gone, will Chun be next?

- During the spring, student and worker demonstrations were held calling for the removal of US troops and nuclear weapons from the Korean peninsula and condemning the US for supporting the military regime and perpetuating the division of Korea. These demonstrations, which peaked in early May with a violent clash between demonstrators and riot police in the industrial city of Inchon, marked the first time since the 1940s that elements of the South Korean opposition have openly identified themselves as anti-imperialists, and underlined a key

* The author is indebted to many Korean and American friends for their insight and support.

development in Korea since 1980: the emergence of an organised (though largely underground) movement identifying with the Third World and demanding radical changes in Korean society and the country's relationship with the US and Japan.

● On 30 May, following a visit to Washington, the opposition party president, Lee Min Woo, met Roh Tae Woo, a former army general and head of the ruling Democratic Justice Party (DJP). The two men announced an 'accord' calling for a special session of the National Assembly in order to shape a constitutional change to pave the way for elections and a possible power-sharing arrangement between the NKDP and the military.

These events have occurred at a time when South Korea is being closely watched by the world as it prepares to host the 1988 Summer Olympic games. Scheduled to take place shortly after a new President is sworn in, these Games are viewed by the Chun Government as a symbolic 'coming of age' for South Korea. A successful Olympics would cap the first peaceful transfer of power since 1945, giving South Korea the international stamp of respectability, legitimacy and prestige, and presenting the country as a mature middle-ranking industrial power. The obvious model is the 1964 Olympics in Tokyo, which projected Japan back into the world community twenty years after losing a catastrophic war. But the emergence of a radical, anti-American mass movement and the potential for political unrest over the next two years has alarmed the Korean government and raised concerns in the US, which is worried that instability in South Korea could upset the huge US economic and military stake in Korea and weaken the bonds between the US, Japan, and South Korea. How the Chun and Reagan governments react in this volatile situation could have far-reaching effects for Korea and Northeast Asia.

This article will discuss the significance of the Korean opposition, focusing on the current campaign aimed at changing the country's Constitution to allow for direct presidential elections. First, it will discuss the background to Chun Doo Hwan's rise to power and the actions taken by the United States during this period. Second, it will analyse how the democratic opposition movement has changed since 1980, with particular emphasis on the rise of anti-Americanism. It will conclude with a discussion of how the various groups within the opposition hope to change the Constitution, and what the possible outcome of this campaign could be.

South Korea under Park Chung Hee

Between 1961 and 1979, South Korea was ruled by Park Chung Hee, a military man who seized power in May 1961. Park's rule was characterised by rapid economic growth (averaging 10 per cent a year), a repressive, authoritarian style of government, and close ties with Japan, which from 1970 on was the largest investor in the country and the primary supplier of technology, and the US, which maintained a sizeable force of ground forces on the peninsula after the Korean War. In 1965, after signing a Normalisation Treaty with Japan (which brought the first initial spurt of capital for the country's export-led industrialisation programme), Park's ties with the US strengthened with an agreement to send 25,000 Korean troops to fight in Vietnam.

By 1970, the direct US military role in Indo-China was slowing down, shifting to the strategy known as 'Vietnamisation', and the Nixon Administration began the slow withdrawal of US ground forces from the region (between 1969 and 1975, over 700,000 US troops left Asia). As part of the policy, in 1971 the US announced the pull-out of the Seventh Division of the US Eighth Army from Korea. Park was also informed that the US could not guarantee the presence of the remaining division beyond 1980.

Park, who had gained power in the name of anti-communism, saw these moves as a weakening of the US commitment to defend South Korea. This feeling was reinforced when President Nixon announced that he was opening up relations with China in 1972—a move that Park followed with the first discussions between North and South Korea since 1953. Out of these meetings came a joint agreement, announced on 4 July 1972, for the peaceful unification of Korea. For a time, many Koreans believed that their long nightmare of national division might be over, but hope gave way to despair when President Park used the unification agreement to increase his own power, leading to seven years of increasingly harsh repression.

The only way in which South Korea could defend itself and negotiate with the North, Park reasoned, was by building a strong and independent economy, with heavy industry at the core. Thus in the fall of 1972, Park instituted the *Yushin* (roughly translated as 'revitalising') Constitution to 'eliminate all inefficient and unproductive factors and promote the national strength and wealth by uniting all the people under the same objective and mind.'¹ The *Yushin* system concentrated

¹ Quoted in *Korea's Economy Past and Present*, Republic of Korea, 1976.

nearly all political power in the office of the President, and gave Park the authority to issue emergency decrees at any time.

The *Yushin* system created tremendous strains within South Korean society. Big business groups benefited, and reaped huge profits at the expense of low-paid workers and small and medium businesses. Dissent within the universities and churches was crushed, and popular politicians like Kim Dae Jung were imprisoned. But as the 1970s wore on, the democratic movement grew in strength and by 1979 was able to mount a major challenge to Park's rule.

The opposition movement under Park Chung Hee

The goals of the dissident movement of the 1960s and 1970s were to establish a constitutional democracy based on the model of the United States and eventually to move towards reunification with North Korea through a process of negotiation. Most Korean dissidents viewed the US as a friendly power, supportive of their movement's democratic goals, and thus almost peripheral to the struggle for a pluralistic democracy. The country that drew most public condemnation was Japan, which since 1965 was the strongest supporter of the Park government and by 1970 the largest investor, dominating much of the Korean manufacturing sector as well as the country's external trade.

Even when Park declared martial law in 1965, 1972, and 1975, these actions were viewed largely as reactions to US policies—such as President Nixon's 'opening' to China or the collapse of the Saigon government—than as moves directly supported by the US. Perhaps the most revealing example of the attitude towards the US was the reaction of many dissidents to President Carter's plan to withdraw the US Second Army Division from Korea in 1976. When asked to comment on this policy, most Koreans expressed fears that it would tempt North Korea to invade or increase the level of repression in the country—and asked Americans not to support the withdrawal.

'In the ebb and flow of human events, specific tactics may change. But what is essential is this: that people fighting for freedom in any country should feel that America is on their side, on the side of freedom', Kim Dae Jung told a reporter in 1979.²

This attitude can partly be traced to the legacy of anti-communism and memories of the Korean War, which combined in many peoples' minds into a strong fear of the Soviet Union and North Korea and a

² 'A visit with Kim Dae Jung,' *Christian Science Monitor*, 9 July 1979

feeling of genuine warmth towards the US for supporting South Korea with the sacrifice of thousands of young men and millions of dollars in aid. The US support for the 1960 student rebellion against Syngman Rhee—when the US Ambassador publicly stated his support for democracy and virtually ordered Rhee to step down—added to this perception. The escalation of tensions between President Park and successive US administrations during the 1970s over human rights, and the 'Koreagate' bribery scandal also served to underline the view that it was the Park dictatorship and not US interests that were at the core of Korea's problems.

But these illusions were to be shattered when the test of American commitment to democracy came in 1979 and 1980.

The political crisis of 1979

As popular dissatisfaction with the eighteen-year rule of Park Chung Hee increased and labour unrest grew in 1979, the political opposition gained visibility and strength. In May 1979, Kim Young Sam was elected as the new party chairman of the opposition New Democratic Party (NDP) after promising to fight for democratic reforms. Then in August, the workers' struggle burst into the headlines of the nation's normally censored press. Two hours after the midnight curfew on 11 August, 1,000 riot police raided the headquarters of the NDP, where 180 women workers of the YH Industrial Wig Company and 30 NDP members were in the second day of a sit-in to protest at the factory's closing. Many workers, NDP members, and reporters were badly beaten during the raid. A young woman, an executive member of the labour union, was killed. The incident was front-page news throughout South Korea for days.³

In early October President Park ousted Kim Young Sam from the National Assembly, ostensibly over his public appeal to the US to withdraw support from Park's dictatorial rule. Soon thereafter, students and dock workers led large demonstrations in Pusan, Kim's hometown; the unrest rapidly spread to the nearby Masan Free Export Zone. A few days later, on 26 October 1979, Park was assassinated by the director of the KCIA, who feared that Park's hard line against dissent was leading to a violent revolution.

Many Koreans rejoiced at the death of the dictator, and looked forward to an end to military rule, a new Constitution, and a

³ *Korea Herald* (Seoul) 12–15 August 1979.

presidential election. There was widespread confidence that these moves towards democracy would be strongly supported by the US.

The re-evaluation of US Asia policy

But by the late 1970s, US policy in Asia had undergone a significant shift from the early part of the decade, when the military was pulling its strategic forces out of Asia. This shift was rooted in the US defeat in Vietnam and the overall weakening of US power in the Third World during the 1970s, a perception heightened by the collapse of the Shah of Iran, one of the strongest US allies in the Middle East, the Sandinista revolution in Nicaragua, and the growing strength of revolutionary movements in the Philippines and El Salvador.

In 1978, the Carter Administration announced that a long-term agreement had been reached with Japan on strengthening regional military cooperation in Asia; for the first time, Japan promised to supply the US with high technology products for military use and extend its military responsibilities 1,000 miles offshore. In the same year, a bases agreement was signed with the Philippines, and military aid to Thailand was increased. These policies were announced at the same time that the US decided on a 'China tilt' in its foreign relations. Negotiations with Vietnam over diplomatic recognition and aid were suspended in favour of close relations with the People's Republic of China. Meanwhile, China and Japan signed a friendship treaty with an 'anti-hegemony' clause clearly aimed at the Soviet Union.

As part of this strengthening of the US strategic position in Asia, the US and Korean militaries became closely integrated through the formation of the Combined Forces Command, which placed 80 per cent of the Korean Army under the direct command of a US general. A new annual war game involving thousands of American and Korean troops, 'Team Spirit', was inaugurated.

As the US strategic position in Northeast Asia deepened, one problem remained for the Pentagon: the 1976 promise of President Carter to withdraw the remaining US Army troops from the Korean Peninsula. Almost from the day this policy was announced, the Pentagon and military supporters in the Congress lobbied strongly to reverse it. In mid 1979, the Administration finally relented and placed the plan 'in abeyance', justifying the decision with the sudden 'discovery' 'that the North's personnel strength is about 200,000 greater than . . . thought'.⁴

⁴ Statement by John A. Wickham, Jr, then commander of US forces in South Korea, before the

Thus, when Park's *Yushin* system finally collapsed in 1979, the US strategic stake in South Korea had deepened. To the consternation of Korean democrats, this stake was to override the concerns with human rights and democratisation.

Chun Doo Hwan takes control

After Park's death, nation-wide martial law was declared and an interim president, Choi Kyu Hah, took over as the civilian head of government. Choi immediately moved to defuse political tensions, freed many political prisoners, and promised open presidential elections within a year. The Carter Administration assured the American public that democratic progress was being made.

But the moves were opposed by a group of hardline military officers, led by a young Lieutenant-General named Chun Doo Hwan, who since March had been the Commander of the Korean Defence Security Command and had spent two years leading Korean counter-insurgency forces in Vietnam. On the night of 12 December 1979—just hours before President Choi was to name a new cabinet—Chun and his key supporters in the Korean military led an internal coup and gained control of the military.

Publicly, the US military protested at Chun's unauthorised movement of troops, while the State Department warned of further unrest if democracy was stalled by the military. But neither President Carter nor General John Wickham (at the time the US commander in Korea) ever made a move against Chun. Moreover, when a group of officers approached Wickham in January 1980 with a plan to overthrow Chun, they were told they would not be supported by the US.² And as the political crisis in Korea intensified over the next six months (and Carter became increasingly alarmed over global events such as the Soviet invasion of Afghanistan and the Iranian take-over of the American Embassy in Teheran), the US grew to see Chun—and another period of military rule—as the only possible alternative for South Korea.

Senate Armed Services Committee, 6 February 1980. Many analysts scoffed at the Carter Administration's reasoning. The FEER commented, for example, that 'Carter's claims that the new assessment [of North Korea] has altered the strategic picture in Korea should . . . be taken with the traditional pinch of salt. Very little has altered—except US political perceptions.'

² 'Yanks who won't go home,' *Far Eastern Economic Review*, 23 February 1979.

³ 'South Korean military will stay out of politics, top US General says' *Asia Wall Street Journal*, 11 March 1980.

After the initial shock of the Park assassination, the mass movement in South Korea grew in strength. In the first few months of 1980, an unprecedented wave of labour and student unrest swept the country. In the second week of May, hundreds of thousands of students demonstrated in Seoul, demanding an end to martial law and the restoration of democracy. When the interim government promised to consider the student demands, the students called off their mass protests and set 17 May as the deadline for the government to publicly announce its schedule for a return to democratic rule. Both the opposition and ruling parties declared their intention to vote for an end to martial law.

But since his take-over of the military in December, Chun Doo Hwan had been carefully consolidating his power. In April, he was 'appointed' director of the Korean Central Intelligence Agency (KCIA), the first time a military officer had headed the dreaded agency. Then on 17 May, Chun declared martial law throughout Korea, bringing an abrupt close to the shortlived movement for democracy, later termed the 'Seoul Spring'. With the 40,000 US troops in Korea on full alert, thousands of South Korean troops and tanks were deployed in Korean cities. The National Assembly was closed. Paratroopers occupied all universities. Hundreds of dissidents who had spoken out since the October assassination of Park were arrested or driven underground.

The Kwangju incident

But in the south-western city of Kwangju, a traditional centre of resistance to central rule, students and other citizens protested about martial law by demonstrating in the streets. For reasons still unexplained, paratroopers deployed to the city began a systematic assault on the demonstrations, killing and wounding scores of youths with bullets and bayonets. Within days, the situation had escalated into an armed revolt, and with guns seized from nearby armouries, a 'citizens' army' drove the martial law troops out of the city. For the first time in decades, the people of Kwangju had control of their own city. Daily demonstrations called for democracy, unification, and an end to military rule. A citizens' committee was formed to negotiate with the military, and requests were made for US assistance in the talks.

But no such assistance came. Unlike the 1960 revolt against Syngman Rhee, when the Eisenhower Administration refused to allow Korean troops under US command to be deployed against the demonstrators, the US opted for a military solution and solidly backed General Chun's

claim that the Kwangju uprising was a threat to national unity. On 26 May, General Chun requested that US General Wickham release 20,000 troops under his command to put down the rebellion. The request was granted, and early in the morning of the 27th, paratroopers and army troops armed with heavy machine-guns entered Kwangju and put an end to the resistance. During the crisis, a US aircraft-carrier group led by the USS *Coral Sea* and two AWAC surveillance planes were deployed to Korea to show US support, and North Korea was strongly warned 'not to interfere'.⁶ The news of direct support from the US was broadcast to the people of Kwangju from helicopters and proclaimed throughout the nation in blazing newspaper headlines. Koreans who had expected help from Carter were dumbfounded: an American teacher living in Seoul at the time wrote,

'Shock' is an insufficient word to describe the reaction when people read these words in black and white in the newspapers. And 'anti-Americanism' is a simplistic label for the emotions that have been generated out of that shock, the intense feeling of having been deceived and betrayed by somebody you trusted and had high hopes in.⁷

As the weeping citizens of Kwangju buried their dead, the US government blandly called on the new military leaders to resume progress 'towards the establishment of a broadly based civilian government'.⁸ Within a week, President Carter dispatched John Moore, President of the US Export-Import Bank, to Seoul. Moore assured the new military junta that US economic support would continue, and gave approval for a \$600 million loan to the government. With this 'seal of approval', the Chun regime had passed its first and most difficult hurdle.

Four months later, Chun's drive for the presidency was catapulted forwards through a press interview with General Wickham, who told two foreign reporters that the US would support Chun if he emerged as president. The interview, carried by the *Associated Press* and the *New York Times*, was given front-page coverage in every newspaper in South Korea. Wickham said that

⁶ 'Korean Generals reportedly seek greater power', *Washington Post*, 28 May 1980. For a well documented report on the US role during this period, see 'Democracy in South Korea: A Promise Unfulfilled,' Prepared by the International League for Human Rights and the International Human Rights Law Group, New York, April 1985.

⁷ 'Recent US Policy in South Korea: A Prescription for Disaster,' unpublished paper by Jeffrey Seeds, New York Korea Action Committee, 1982. Estimates vary about casualties in Kwangju. The Korean government claims that no more than 200 died in the carnage, but opposition forces say the death toll was somewhere between 2,000 and 3,000.

⁸ *Asia Wall Street Journal*, *op. cit.*, 11 March 1980.

provided that [Chun] comes to power legitimately and demonstrates over time a broad base of support from the Korean people, and does not jeopardise the security of the situation here, we will support him because that, of course, is what we think the Korean people want.⁹

With this US approval, Chun quickly forced President Choi's resignation, and in a few days assumed the presidency. Asked to explain the US position a few weeks later, President Carter told the *Boston Globe* that

We would like to have a complete democracy [in South Korea] with full and open debate, free press and elected leaders. The Koreans are not ready for that, according to their own judgement, and I don't know how to explain it any better.¹⁰

Chun's new regime

Even before assuming the presidency, Chun and his military supporters were moving swiftly to refashion South Korea in their image of a 'new society'. In the weeks following the 17 May coup, thousands of people suspected of subversive thought and activities were arrested, fired from their jobs, or sent to 'purification' camps run by the military. Some four hundred journalists were expelled from their positions, while several hundred labour leaders were purged from the labour movement or fired from their jobs. 15,000 street toughs were rounded up (and later emerged from the military camps as 'plainclothes' police).

During the summer, Chun appointed a new Constitutional Assembly, which prepared a new Constitution. A new labour law was adopted that banned industrial unions and regional labour federations. These measures and other restrictions led to a 30 per cent drop in union membership and severely weakened the ability of the unions to organise. A new Press law was adopted, putting the media under strict government control; the National Security and Anti-Communist Laws used to imprison dissidents in the 1970s were combined to institutionalise the worst decrees of the Park era. But unlike the 1972 *Yushin* Constitution, the new Constitution stated that presidential terms were to be restricted to seven years to prevent long-term rule by one person. A system of indirect elections for President was also established.

⁹ 'US said ready to back Chun', Associated Press dispatch, *Portland Oregonian*, 8 August 1980

¹⁰ Quoted in 'General says South Korea needs "new leaders" and he is willing', *New York Times* 9 August 1980.

In February, 1981, Chun became the first foreign head of state to visit newly inaugurated President Ronald Reagan. A 'new era' in US-Korea relations was proclaimed. Since then, South Korea has resumed its role as a key military ally of the US and Japan in Northeast Asia. By 1983, economic growth had stabilised and direct investment began to increase, particularly from US manufacturing companies anxious to capitalise on the low wages and high productivity rates of Korean workers. However, Korean companies remained highly leveraged with an average debt to equity ratio of 70 per cent to 30 per cent. In 1985, the country's debt had reached almost \$50 billion, the fourth highest in the world.

The democratic movement of the 1980s

The events of 1979 to 1980 and the strong US support for the Chun regime over the past six years have had a profound impact on the ideology and structure of the democratic movement. What was once a Western-oriented movement based largely on middle-class resentment of Park Chung Hee's military dictatorship has been transformed into a nationalist struggle for independence from foreign intervention, and eventual unification. Leadership of the movement is no longer the domain of politicians and religious leaders; many of the country's dissident leaders now come from a largely underground mass movement representing the demands of the *minjung* (the people)—farmers, urban workers, intellectuals, cultural workers and dissident elements from the Catholic and Protestant churches. The emerging movement identifies more with the Third World than with the West, and seeks major changes in South Korea's political and economic relationships with the US and Japan.

As in the 1970s, the most respected opposition politicians are Kim Dae Jung and Kim Young Sam, who in 1984 became the co-chairmen of the Council for the Promotion of Democracy, a grouping of politicians and democratic activists opposed to military intervention in Korean politics. The Council became the core of the New Korea Democratic Party (NKDP), which captured nearly 40 per cent of the popular vote in the February 1985 National Assembly elections and is now the leading opposition party.

The strongest grouping of mass movement organisations is the United *Minjung* (People's) Movement for Democracy and Unification (UMDU). A coalition of twenty-three organisations representing

banned trade unionists, intellectuals, poets, dismissed journalists, church activists, and farmer groups, the UMDU was formed in 1984 as a vehicle to unite the many strands of the democratic movement. Its core consists of organisations and individuals active in the 1970s who believe their movement will not gain public support unless its many factions can unite behind a common agenda and purpose. Fiercely anti-fascist and strongly opposed to American and Japanese intervention in Korean affairs, the group's leaders want to build a grass-roots movement that will challenge military rule and South Korea's economic system without relying on alliances with politicians. While respecting people like 'the two Kims', many UMDU activists feel the politicians' political ambitions were a barrier to forging an effective anti-military alliance in 1979 and 1980.

'We want to develop a mass line to organise our people in one organisation that won't represent the interests of a single individual,' a Movement leader said in a 1984 interview. 'We have very different aspirations than any political party.'¹¹ Since its formation, the UMDU—which is chaired by the long-time Christian dissident, Moon Ik Hwan—has played a key role in mobilising demonstrations against Chun Doo Hwan's foreign policy and in criticising US support for the Chun regime. In the spring of 1986, many of its leaders were forced underground and arrested after participating in the 3 May Incheon demonstration that called for the withdrawal of US troops and nuclear weapons from Korea.

One of the most dramatic expressions of the movement of the 1980s is the so-called *minjung* cultural movement. Based in the traditionally militant province of South Cholla, this art form has gained tremendous popularity throughout the country, particularly in the rural areas. Adopting traditional means of expression such as wood-block prints and the masked dance, as well as modern forms such as novels and short stories, *minjung* art portrays the lives and struggles of ordinary workers and farmers and expresses the strong nationalist and anti-foreign attitudes that have characterised the Korean character for centuries, but have emerged recently in South Korea in response to more than twenty years of military rule and close ties with the US.

The prints, plays, novels and masked dance of the *minjung* art movement have redefined Korean history, tracing the Korean people's struggle—from the peasant revolt of the 1890s, through the 1919

¹¹ Personal interview, Seoul, August 1984.

uprising against Japanese colonialism and the general strikes and mass demonstrations against US military occupation in 1946, to the Kwangju Insurrection¹²—as one continuous struggle against foreign domination. Not surprisingly, the *minjung* movement has been harshly suppressed by the Chun government, which sees in it dangerous trends towards class struggle and identification with the Third World—ideas inimical to Chun's pledge to remake South Korea as a predominantly middle-class industrial power-house and join the ranks of the developed nations by the 1990s.

But it is this deep and growing conflict over the identification of the Korean nation that is at the heart of the struggle over the present Constitution and the emerging splits between the mass movement and the moderate opposition over a possible compromise with Chun and the military.

The growth of the movement, 1980–1986

The Korean opposition forces have gone through three distinct phases since the imposition of martial law in 1980. In the first phase, dating from the May 1980 coup until early 1982, the movement was still under attack and reconsidering its tactics and strategies. A second phase, from 1982 until early 1984, was a period of rebuilding grass-roots democratic organisations in urban factories and in the rural areas. Dissidents also began more actively to criticise the US for its policies of support for Chun, and to look again at the entire post-war history of Korea. In the third phase, the opposition began to form public organisations and publicly challenge the Chun regime's foreign and domestic policies in street demonstrations and other forms of protest. In this period, the political opposition reorganised in the form of the New Korea Democratic Party, and won a third of the seats in the New National Assembly. And for the first time in nearly three decades, the cry 'Yankee Go Home' began to be heard on South Korean campuses,

¹² Some of the most striking prints have come out of Kwangju area, where the memories of the May 1980 'People's Uprising' remains strong. One image portrays a Korean peasant warrior stamping out an American eagle: 'Down with American imperialism' the warrior's banner reads. In another, a Korean woman breaks her social and economic shackles and throws away the figures representing the country's dependence on foreign powers. One of the most famous prints from this genre illustrates what the Kwangju Insurrection has come to mean for many Cholla natives. local merchants joyfully distributing food to young armed fighters, the 'Kwangju Commune' in which citizens controlled their city for the first time in forty years and shared food, water, transportation, sorrow and joy. The tears of mourning and the cries of despair over the Kwangju massacre have clearly been transformed into shouts of resistance and the hints of a much sharper struggle in the days ahead.

underscoring a new dimension in the Korean situation: unlike the anti-government movement in the 1970s, many dissidents now see the US as an unfriendly country, and a barrier to democratisation and unification. The shift in emphasis from a struggle against dictatorship to a struggle against the US is one of the most significant developments of the 1980s and could have a far-reaching impact on US interests in Northeast Asia.

Anti-Americanism

The initial reaction to the US support for Chun (particularly the decision to allow Korean troops to be deployed to Kwangju) was one of despair and betrayal. But as Koreans began to study the events that had occurred, they began to conclude that American policy was no accident but a result of its own national interests.

In the early stage of anti-Americanism, the US was seen as the most important supporter of the Chun regime, and warnings were issued for US leaders to understand the nature of the Korean struggle in order to avoid a confrontation directly with the people. One of the key documents of this period was a leaflet distributed at the prestigious Seoul National University (SNU) in 1980. 'The US, seeing an imminent crisis in the growing Korean people's struggles in the 1970s, reorganized the country's ruling system through preventive measures on October 26, 1979, and now props up the fascist regime', the leaflet stated. Rather than directly attacking US policy, it posed the question: 'Can we continue forever to think of the US as a friendly country?'¹³

As sentiments like this were circulating on college campuses, disillusionment with US policies was spreading among religious dissidents and intellectuals. Under Chun, many people concluded, South Korea had become even more subordinate to US military interests than under Park. These dissidents have been particularly angered over the continuing presence of US nuclear weapons in Korea: reports that Pershing and Tomahawk missiles might be stationed in Korea, and the growing involvement of South Korea in American and Japanese military planning in the Far East.

A 1985 statement released by the Protestant Korean National

¹³ 'Call for a joint Anti-fascist struggle', leaflet distributed by Seoul National University students, December 1980. This document, like other leaflets quoted in the article, were made available to the author through dissident sources in South Korea. Because of strict government controls on printing in South Korea, few leaflets like this are actually published, but are instead printed and distributed by hand.

Council of Churches was an example of the resurgent anti-American mood among the more moderate sectors of the opposition. The Pentagon's nuclear strategies in Korea, the document stated, 'have threatened the survival of the Korean people, making our survival dependent on a foreign power', a situation that 'reminds us that American policy has been geared to American interests rather than to the development of the Korean people.'¹⁴

Economically, a series of well-publicised disputes between US multinational corporations and the Korean government have deepened the suspicion that the US is interested in Korea for its own ends. An audit of Bechtel Power Corporation's operations in the nuclear industry by the government-owned electric utility in 1984, for example, led to a brief investigation in the Korean National Assembly and sharp denunciations in the Korean press of 'unfair contracts' given to US firms. Koreans have also been angered by the growing protectionism in the US. In 1984, when the US Commerce Department charged four Korean companies with 'dumping' colour televisions on the US market, two major Korean business groups called for retaliation, and suggested that, to begin with, contracts for the next two nuclear projects be awarded to non-US firms. More recently, strong pressures on South Korea to open its market to US exporters of food, beef, service and 'high tech' products have sparked a number of student protests. In 1985, several hundred farmers attempted to march on the US Embassy in Seoul to protest at the US pressures to liberalise beef and grain imports; later in the year, a group of students occupied the American Chamber of Commerce in Seoul to protest about what they called US 'market terrorism', a slogan that has become part of the student protest lexicon.

An 'open letter' to President Reagan, written in 1985 by the UMDU explained how US political and economic policies were fanning the flames of anti-Americanism. Because this letter reflects the thinking of many Korean dissidents, it deserves some quotation here:

[The Reagan Administration] has maintained 'friendly ties' with the military dictatorship, and with a view to protecting and expanding the vested interests of the United States in this country, you have either brought for explicit demand or exerted implicit pressure. The US multinational corporations already in Korea are collecting huge profits through unfair contracts and through the sheer size of their capital. While the military dictatorship recklessly

¹⁴ 'Our position on nuclear weapons in Korea', Korea National Council of Churches, Seoul, June 1985. Made available to author from North American Coalition for Human Rights in Korea, Washington DC.

opens the door to US goods, the quantity of imported agricultural products increases by the day, driving the nation's economy and the livelihood of the rural population to ruin.

The mass culture of the United States, promoting cheap pleasures and reckless consumption, and paralyzing the critical faculties of the people, is inundating Korea. Even more serious than all of these facts is that Korea, in being a base for launching US nuclear weapons, may draw herself and the entire East Asia into the vortex of a nuclear war. We know well that your administration is experiencing intense opposition in many European countries to the deployment of nuclear weapons. Because of this, the United States is increasing its store of nuclear weapons in Korea where our 'docile government' welcomes such deployment and where, except for an awakened few, the general population has been too numbed to raise any protest . . .¹⁵

Since that letter was written, however, many in the UMDU, the student movement, and other sectors of the opposition have concluded that the US has no intention of being a 'true friend of Korea'. This has led to a major escalation of anti-American rhetoric and actions. In May 1985, a group of students seized the premises of the US Information Service in Seoul for several days, demanding a formal apology for US actions during Kwangju. These anti-US actions peaked in the spring of 1986 with student and worker demonstrations calling for the withdrawal of US troops and nuclear weapons from Korea.

The campaign to change the Constitution

The growth of the democratic movement, particularly the emergence of the student movement and the renewed strength of the labour movement, provided the impetus for the decision to commence with a national campaign to change the Constitution and have direct elections for president. On 17 March 1986, five major organisations formed a united front for pressing the constitutional petition campaign called the National Alliance for Constitutional Reform, and immediately launched a series of provincial mass rallies. Six people were named to sit on the Alliance council: Kim Dae Jung and Kim Young Sam of the Council for the Promotion of Democracy, Lee Min Woo, president of the opposition New Korea Democratic Party, the Reverend Moon Il Hwan of the UMDU, the Reverend Park Hyung Kyu of the Korea National Council of Churches (KNCC), and a lawyer, Lee Don Myong, representing the Korean Catholic Church.

¹⁵ 'Open letter to President Ronald Reagan of the United States of America', unpublished, United Minjung Movement for Democracy and Unification, Seoul, 10 May 1985.

The Chun government's reaction to the campaign was erratic. At first the constitutional campaign was blasted as illegal and a threat to national security. But as the Marcos regime collapsed in the Philippines and Chun's defiant opposition to open elections became increasingly untenable in the face of an official US line favouring elections, there was a shift: *constitutional change could be openly discussed, but no change would be allowed until after the indirect elections and the Olympic Games, both scheduled for 1988.*

Rather than press for sudden changes, Chun suggested a period of 'grand politics' in which the opposition would join with the government in maintaining unity and ending confrontation until 1989. This idea was soundly rejected by the opposition. Kim Young Sam compared Chun's use of the Olympics for propaganda purposes to Adolf Hitler's.¹⁶ The Korean Catholic Bishops stated that 'if "grand politics" dictate the denial or postponement of people's sovereign rights, we have no choice but to reject such ideas and to admit that the 1986 Asian Games and the 1988 Olympiad are going to be only covers for further oppression.'¹⁷ Several hundred priests issued public statements supporting the signature drive.

Then in March the rallies began, mobilising thousands of citizens in a vivid demonstration of the Korean desire for democratisation. But as this drive continued, anti-American demonstrations on campuses increased, with slogans calling for the withdrawal of US troops from Korea and labelling the Korean military a 'mercenary force' for the US. In late April, several students and workers burned themselves to death to protest at US intervention in Korea. In this atmosphere, Kim Dae Jung and several other leading dissidents issued a statement distancing themselves from the radical protests. Partly in response to this statement, several thousand students and workers rallied in the industrial city of Incheon¹⁸ chanting slogans against 'US imperialism' and

¹⁶ 'Thousands demonstrate in South Korea', *Washington Post*, 24 March 1980.

¹⁷ 'Letter from the Korean Catholic Council for Justice and Peace', Seoul, 3 March 1986. Made available to author from North American Coalition for Human Rights in Korea, Washington DC.

¹⁸ The series of events leading to the confrontation in Incheon began in mid-March, when anti-war, anti-nuclear, and anti-US slogans first appeared in a demonstration at Seoul National University (SNU) called to oppose the conscription of sophomore college students for military 'field training,' a euphemism for indoctrination and brutal punishment of political offenders. At the same time, several students candidates for campus government ran on a platform calling for a withdrawal of US troops and nuclear weapons from Korea and an end to the massive 'Team Spirit' military exercises that are held every spring. Then in late April, at twin demonstrations held at SNU and Sung Kyun Kwan University, students called the military training 'a mercenary training for Yankees,' a slogan that began to be echoed on other campuses. When riot police

criticising those people in the KNDP who were publicly discussing a compromise with the government.¹⁹

The public emergence of a leftist faction within the Korean democratic movement and the open criticism of the KNDP by these forces are also the outcome of a raging debate over the nature of the Chun government and the most effective means of challenging the military role in Korean politics. Many Korean mass movement groups view their participation in the NKDP campaign to change the Constitution as a tactical alliance. That is, they see the movement as an important means of gaining mass participation in the democratic movement and an educational tool to inform Korean citizens of the real nature of the military dictatorship.

The UMDU, for example, makes a clear link between the signature campaign and the broader movement for independence and eventual reunification with North Korea. On 5 March 1986 its leadership issued a statement calling the Chun government a 'military-dictatorial regime, made up of an extreme minority of anti-democratic, anti-national and anti-people military elite'. 'This campaign,' the statement declared, 'presupposes the retiring of the military dictatorship . . . We expect all Korean people to join . . . and thus to march with dignity toward the realisation of democracy and national unification.'²⁰ Student groups have taken a similar line and were crucial in mobilising the thousands of ordinary citizens who have turned out for the spring rallies.

But as Chun—backed by the US—has tried to conciliate the NKDP and other moderates by discussing compromise and by trying to channel

 confronted hundreds of SNU students gathered to protest student conscription on 28 April, two student leaders doused themselves with gasoline and - after police refused their demands to withdraw - set themselves on fire. Both died. They are among nearly ten Korean students, workers, and farmers who have committed suicide in the past year to protest the continuing repression in their country. The self-immolations and the sharp anti-American sentiments expressed at the campus demonstrations of 28 and 29 April—which reportedly drew some 7,000 students - brought immediate condemnation by the Chun government and the state-controlled press.

¹⁹ According to dissident sources in Seoul, riot police on the scene in Inchon violently attacked the demonstrators, who then fought back with Molotov cocktails and pipes. For the first time, the government-controlled television networks broadcast live scenes of the demonstration, apparently an attempt to show how violent the movement had become and sway public opinion. According to the NKDP, there were a number of paid government provocateurs on hand to stir up the crowd in Inchon. 'Inchon rally blocked by police-induced violence; NKDP calls for investigation', *Korea Weekly Report*, North American Coalition for Human Rights in Korea (Washington DC), 16 May 1986.

²⁰ 'Declaration of Pan-National Movement for Demanding Withdrawal of Military Dictatorship and Achieving Democratic Constitution', United Minjung Movement for Democracy and Unification, unpublished, Seoul, 5 March 1986.

the debate from the streets and back into the National Assembly, the divisions within the broad coalition have intensified.

Among the compromise ideas that have been floated are a proposal for 'dual rule', in which the president would be directly elected and the prime minister chosen by the Assembly; a parliamentary system in which the president is a figure-head and the prime minister indirectly elected; and a 'power-sharing' arrangement between the military and the political parties, based on the model of Brazil and some Latin American countries.

The US has played a role in this debate by encouraging the opposition to consider other arrangements besides direct elections. In his visit to Korea after the Inchon demonstrations, for example, the US Secretary of State, George Shultz, noted that 'obviously in a parliamentary system the prime minister is not elected directly at all . . . How [countries] design things can vary and you still call it democracy.' He also made comments highly critical of the opposition that were interpreted as an expression of near-total support of Chun.²¹

These attempts at compromise have been formulated with full knowledge of the make-up of the NKDP, which is made up of several different factions from the opposition party of the 1970s. The largest two factions are those loyal to Kim Dae Jung and Kim Young Sam. Kim Dae Jung is perhaps South Korea's most well-known dissident. A politician from Mokpo, a port city in the southern province of Cholla Namdo, Kim ran two strong presidential campaigns against President Park Chung Hee, almost winning in 1971 (Kim captured 45 per cent of the vote and many analysts believe he would have won if it had been a clean election). In 1973, while on a speaking tour of Japan, he was kidnapped from his Tokyo hotel room by the KCIA and forcibly taken to Korea, where he spent much of the next six years in prison or under house arrest. After the 1980 coup, he was charged with being a communist and organising the Kwangju Uprising, found guilty and sentenced to death. His death sentence was lifted in 1981 as part of a

²¹ 'An opposition which seeks to incite violence is not a contribution to [stability]', US Secretary of State George Shultz declared in a press conference en route from Tokyo to Seoul. In South Korea, he said, 'There is a terrific job being done in security, a terrific job being done in the economy, and an impressive movement going on in terms of the institutions of democracy'; the Philippines and Korea, he added, 'are about as dissimilar as any two situations you could imagine.' Shultz's comments and his refusal to meet individually with leaders Kim Dae Jung and Kim Young Sam astonished many in the opposition and added even more fuel to the anti-American flames. 'Shultz, in Seoul, says US backs Korea's efforts', *New York Times*, 8 May 1986.

complex deal in which Chun was invited to be the first foreign head of state to visit the newly inaugurated President Reagan.

Kim Dae Jung is strongly anti-communist, and is thus viewed with some wariness by the more militant sectors of the democratic movement. But he is highly respected for his courageous stand against military rule and for the suffering he has undergone in the long struggle for democracy. Because of his close connections with the mass movement—and perhaps because he is confident of making an excellent showing in an election—Kim has insisted on constitutional change and direct elections without conditions.

Kim Young Sam is more conservative and more amenable to compromise than Kim Dae Jung, and is viewed by many Koreans as a highly opportunistic politician willing to use the movement in order to advance his own position. This perception has been strengthened by recent events, in which he and his followers are reportedly intensively engaged in compromise discussions, sensing that Kim could be elected prime minister by a new Korean Parliament.

The most conservative wing of the party is led by Lee Chuel Sung. Lee, who has openly voiced his preference for a parliamentary system, made his mark in the 1940s when he was the leader of a fascist youth group that helped to break up left-wing worker and student organisations. After the 1960 Revolution that toppled Syngman Rhee, Lee was a key funder of student groups calling for reunification. During much of the 1970s, Lee led the opposition NDP and was one of the most vocal critics of Kim Young Sam when Kim assumed the leadership in 1979. He was in Washington with party leader Lee Min Woo for meetings with the Democratic Party leadership and the Reagan Administration in May when compromise was seriously discussed with the US.

Just days after their return, Lee Min Woo reached an accord with Roh Tae Woo, a former general and the head of the ruling Democratic Justice Party (DJP). The agreement called for a special session of the South Korean National Assembly to begin shaping a change in the constitutional provisions on presidential elections. According to the two men, the Assembly will revise the 1980 Constitution 'in a way that will guarantee the people a free choice in government.'²² The session began meeting in mid-June.

The accord was a major victory for Chun and the Reagan

²² Early basic law change possible if rival parties reach accord: 'Chun', *Korea Herald* (Seoul) 4 June 1986.

Administration. If the special session reaches agreement on the Constitution, Chun and Reagan will have succeeded in channelling the political struggle about the 1988 transfer of power out of the streets and into the safe confines of parliament—thus 'solving' the crisis and drawing a line between moderate, pro-US opposition politicians and the more radical groups who want an end to military rule and US intervention in Korean affairs.

But the compromise discussions also reflect a serious split in the NKDP, particularly between the forces of Kim Dae Jung and Kim Young Sam. Until the 30 May meeting between Lee Min Woo and Roh Tae Woo, the NKDP had insisted that no debate could be held until the government released political prisoners and restored the rights of Kim Dae Jung and 500 others barred from political activity. When the Lee-Roh accord was announced, however, nothing specific was said about settling these issues; instead they were listed as topics to be discussed in the special session.²³ Korean opposition forces in Washington say that Kim Dae Jung was not involved in or informed in advance of the compromise, but that Kim Young Sam was part of the process (party president Lee is from his faction).

The two men have not divided publicly over the issue, but in interviews with reporters, Kim Dae Jung strongly criticised Lee Min Woo's compromise. Moreover, he has stated that a constitution that does not contain guarantees for direct elections will not be tolerated by his faction or the mass movement. 'If we fail to realize a democratic constitution, next spring we will appeal to our people to rise up and have non-violent demonstrations in the streets to force democracy', he said. Kim Young Sam was more circumspect: 'I don't think it necessary to project the next step because I'm hopeful something will come up before then. If President Chun postpones this opportunity, it would be a bad thing for the people and the country.'²⁴

But any talk of compromise with military rule has been strongly condemned by the student movement. One statement from Seoul National University said that any system of power-sharing 'guarantees an indefinite reign by the military leadership . . . The process of its

²³ As the sessions began, Lee Min Woo said that any new constitution should ban military intervention in politics and 'insure the people's right to resist a military coup.' He added that issues like equitable distribution of wealth, employee participation in management, and the release of political prisoners would be discussed in the parliament. 'In Seoul, Legislature Begins To Debate Charter Revision', *New York Times*, 10 June 1986.

²⁴ 'Korea's opposition is inching toward its goal', *New York Times*, 8 June 1986.

adoption and implementation will not be based on national consensus but rather on the interests of politicians. We can clearly see the fallacy and must resolutely reject it.²⁵

The UMDU has also been strongly critical of those in the NKDP willing to talk about power-sharing with the military. In a long statement issued on 8 May—shortly before the organisation's president, Moon Ik Hwan, was arrested and its key leaders went underground—the UMDU saw any compromise that maintained a military role in politics as a sell-out of the democratic movement. 'The regime's proposals for the "grand cooperation" of all political parties and civilian organizations are nothing but a conspiracy to utilize the conservative opposition for their own interests', the statement said. It continues:

In world history, there has never been an instance where a dictatorial regime stepped down through dialogue or cooperation. There is no doubt about the fact that the vitalization of the people's movement is the only way to bring about the withdrawal of the dictatorship. The time has come for the NKDP, instead of emphasizing the fact that they are a conservative opposition party, to truly understand what the Korean people really hope for, and to participate fully in the struggle to abolish military dictatorship from our land . . . [We] have closely watched Secretary of State Shultz's visit to Korea. If he should instigate both ruling and opposition parties to form the 'All Conservative Coalition,' he will surely intensify our people's anger against the US.²⁶

Conclusions: some possible outcomes

One factor that makes the situation in South Korea so unusual is the 1988 'deadline' that both the government and the opposition forces are working under.

To President Chun and his supporters in the US, 1988 will be significant for two reasons. First, it will mark the first peaceful transfer of power in Korean post-war history; and second, the staging of a successful Olympic Games will usher this 'new Korea' into the ranks of the developed nations and mark South Korea's debut as a full partner with the US and Japan in the emerging 'Pacific Century'.

To accomplish this goal, a successful negotiation with the opposition

²⁵ 'Our position on constitutional revision', Seoul National University, unpublished leaflet, no date.

²⁶ 'Withdrawal of Military Dictatorship: The Only Way to Achieve Democratic Government. The Position of the United Minjung Movement for Democracy and Unification on the Present Political Reality,' UMDU, Seoul, 8 May 1986.

NKDP is required, both to change the Constitution and to accommodate public demands for a fair election in which the people actually have a choice. This could entail a power-sharing arrangement with the NKDP, with the insistence that Chun's Democratic Justice Party (and the military) maintain a hold on power. Such a 'compromise', however, must occur soon—either in 1986 or early in 1987—so that an election can be held in 1987, with the transition to occur in 1988.

For the opposition movement, reaching 1988 with the DJP still in power would mean a major setback for Korean democracy. Their 'deadline' is to force a constitutional change to allow for direct elections by 1987, and then open up the political process to debate on the direction of the Korean economy, local autonomy, political prisoners, the role of the military, and eventually reunification with the North. Open debate on such issues, they now claim, is impossible, and will remain so as long as the military can intervene in politics at will.

For this reason, the next year will be crucial for South Korea. If the current special session of the Assembly does not emerge with an acceptable compromise—such as direct elections—the mass movement, with the support of Kim Dae Jung, will probably take to the streets once again.

Another possibility would be for the conservative wing of the NKDP to agree to a power-sharing arrangement in which a prominent leader (for example, Kim Young Sam) would be elected prime minister in a parliamentary system of government, and share power with an indirectly elected president, most likely from the DJP. This could lead to a split within the party and massive public demonstrations. The result of such a breakdown could be deeper unrest, more repression, and a possible reimposition of martial law. Both scenarios could provoke a serious confrontation with the military.

The US government has an important role to play in the process. Both the Reagan Administration and Democratic Party officials with responsibility for East Asia support Chun's plan to step down from power in 1988 and preside over a peaceful transfer of power to a president chosen by the Korean people. But neither party has shown any support for those Koreans demanding a clear break with military participation in politics or Korean ties with the US, nor have they shown any inclination to recognise the causes of anti-Americanism. Instead, their policy is that Chun has built a respectable (albeit, repressive) civilian government with broad public support, and that American

interests dictate continued support for the Korean government.²⁷ The continuation of this approach to South Korean politics does not augur well for Korea—or the US.

If the situation deteriorates and the US is perceived as opposing demands for full democratisation, the anti-American feeling so prevalent today could become explosive. Many Koreans have warned that US support for another military coup would be the 'last straw' on the back of Korean-American friendship.²⁸ In any case, if a 'compromise' is worked out with the clear support of US officials that keeps the US-Korean military and economic ties intact, then the political situation is almost certain to grow more radical, and possibly more violent.

Despite US assurances that South Korea is on the road towards political stability, the country appears headed for a period of political turbulence and unrest. Unless the public demands for democracy in South Korea are met, events in that country could become explosive once again, with serious ramifications for both the region and the world.

²⁷ Shortly after returning from a trip to Seoul in late April, Representative Stephen Solarz – who is considered in Washington to be the most knowledgeable person in Congress on Korea – wrote an editorial in the *Washington Post* in which he argued that 'Widespread political instability in South Korea, which could easily occur if the government tries to suppress the opposition, might lead Kim Il Sung to miscalculate that the moment had come to reunify the peninsula under communist control.' South Korea, he said 'is an example of a country where we can more effectively promote our strategic interest by promoting our political values.'

Another important Democratic policymaker is Richard Holbrooke, who was President Carter's Secretary of State for East Asia and played a key role in the US role in 1980 and in convincing the Congress that the support for Chun was justified. Writing in the most recent issue of *Foreign Affairs* magazine, Holbrooke said that, to understand Korea, American observers 'must drop their ideological views of what constitutes political progress' and understand that 'things have changed substantially in Korea in recent years.' 'The current tensions in Seoul,' he wrote, 'are focused on the details of Chun's proposed system for selecting the next president in 1988 . . . they are not so much directed against Chun himself.' 'Total depoliticization of the military in the next decade [is] both unrealistic and unlikely' because 'of the undeniable security issue.' And American influence over the next few years 'must be exercised with great skill and an absolutely clear-eyed understanding of the US national interest.' Stephen J. Solarz, 'After Manila, is Seoul next?' *Washington Post*, 27 April 1986; Richard Holbrooke, 'The next challenge,' *Foreign Affairs* 64 (4) Spring, 1986.

Militarism and repression in Indonesia

The Indonesian military regime enjoys the reputation in the West of being one of the most stable regimes in the Third World. Few commentators explain however that this stability has been achieved by means of the systematic repression of all social forces and the imposition of a highly manipulated political structure. Even fewer bother to remind their readers that Suharto's military government came to power by unleashing a bloodbath that left an estimated one million people dead. While murderous despots like Pol Pot and Idi Amin have been effectively disposed of and their regimes are now spoken of with righteous horror, the regime of Suharto and his generals lives on, favoured by Western powers. Its bloodthirsty crimes in Indonesia itself as well as in West Papua and East Timor, and the totalitarianism that now prevails in the country, are hidden from view.

The main characteristics of the regime are: rule by a violent and ruthless military bureaucracy which controls every facet of life, its fanatical hatred for left-wing ideology and political Islam—two ideologies that have long traditions of mass support in the country—and its determination to impose ideological conformity on the entire population in order to perpetuate the survival of militarism. The regime has reinforced the role of central government and a strongly centralised bureaucracy, the foundations of which were laid in Dutch colonial days and further buttressed during the Japanese occupation and the two decades of Sukarno's presidency from 1945 to 1965.

Many of the essential features of the present-day military bureaucracy are rooted in the period of Sukarno's 'guided democracy', throughout the course of which martial law in one form or another remained in force. The central doctrine of Indonesian militarism, which was formulated and on its way to being implemented in the decade before Suharto seized power in 1965, is the *dwi-fungsi* or 'dual function' which prescribes that the Indonesian Armed Forces (ABRI, Angkatan Bersenjata Republik Indonesia)—primarily the army—must dominate political and social as well as military and security affairs.

ABRI's military and security function

The military and security function is concentrated in the hands of the territorial army, military intelligence and the elite troops, all of which play crucial roles in giving support to Indonesia's militarist establishment. The army's primary strategy for maintaining control of the population is its doctrine of 'territorial management', a doctrine that dates back to the 1950s and was first formulated by General A H Nasution (now retired, and a political outcast) when he was Army Chief-of-Staff. The objective of territorial management, as one territorial commander recently put it, is:

To manage the potentials of an area including the geographical and demographic factors and the ideological-political-social-cultural-military conditions, in order to create regional strength as the invincible arena, instrument, and conditions of struggle for implementing the defence-security task by means of the security approach.¹

It is a doctrine which asserts the army's indisputable right to manage all aspects of society in the interests of national security. The command structure of the army is designed to parallel the civil administration right down to the villages. Territorial troops are thus able to operate a system of direct control over the population in both urban and rural districts.

It is through the Army's territorial structure that the system of repression functions, feeding and fed by military intelligence. Security is the responsibility of KOPKAMTIB (Komando Operasi Pemulihan Keamanan dan Ketertiban, Operational Command for the Restoration of Security and Order), the organ of repression that was set up by General Suharto in October 1965. Today, KOPKAMTIB is under the command of General Benny Murdani, Commander-in-Chief of the Armed Forces. Murdani enforces the special powers vested in this instrument of repression through the army's command structure of regional and local territorial commanders, in their capacity as executive officers of KOPKAMTIB.

KOPKAMTIB was originally set up to persecute the left and is still in charge of the surveillance of former political prisoners and of all people suspected of being former members or sympathisers of the outlawed Indonesian Communist Party (PKI) which was banned in 1965. Over the years, KOPKAMTIB has also dealt with other political opponents

¹ Brigadier-General Sembiring Meliala, *The Basic Pattern of Territorial Management Specific to Irian Java, Employing the Method of Community Development Centres*, April 1984, p. 5 (Internal army document, unpublished).

of the regime, notably student protest in the 1970s and the more recent resurgence of Muslim opposition.

The other main intelligence body is BAKIN (Badan Koordinasi Inteligen, Intelligence Coordination Agency), run by General Yoga Sugama who was trained in intelligence work by the Japanese during the Pacific War. BAKIN concentrates primarily on spying and on providing the regime with assessments of the nature and origins of political dissidence.

ABRI's social and political function

The social and political ('sospol') side of the army's dual function operates at many levels. Overall political and economic strategy has since 1965 been the prerogative of the Armed Forces leadership. Suharto stands at the pinnacle of this decision making process as Head of State and Head of Government. He is the acknowledged arbiter of policy, and is served in all sectors of the state administration by officials—some civilian but mostly military—who are loyal to him and dependent on him for the patronage and high office he can dispense.

Both legislative bodies, the DPR (Dewan Perwakilan Rakyat, People's Representative Assembly) and the MPR (Majelis Pemusyawaratan Rakyat, People's Consultative Assembly) are controlled by Suharto and the Armed Forces leadership. Well over 80 per cent of DPR and MPR members are appointed directly by the President or by organisations under Armed Forces control, primarily the army's political wing known as GOLKAR (Golongan Karyawan, Function Groups). Legislation initiated by the military government is not only assured a safe passage through both houses, but the military have also imposed a system that guarantees unanimity in both houses by means of a system of consensus that has been written into DPR and MPR standing orders.

The most telling example in recent years of the compliance of the legislature to the dictates of the regime is the unanimous adoption of five political laws in 1984 and 1985 regulating the entire political system. One of these five laws is the Societies' Law which requires all political and social organisations to accept the state ideology, *Pancasila*, as their sole ideology or *azas tunggal*.

The judiciary is also under firm military control. The Attorney-General, the Minister of Justice and the Chairman of the Supreme Court are all lawyer-generals from the Army's Law Academy. Judges

are government employees, and as such, are required to join the civil servants' association and pledge loyalty to the state doctrine and government programmes. As if this were not enough to guarantee the loyalty of the judiciary, the Supreme Court chairman has created a new structure ensuring close collaboration between judges, public prosecutors and the police.

Regional and local government is heavily militarised under the Department of the Interior, where 55 per cent of senior officials are from ABRI.² Thousands of active-service and retired soldiers have been appointed as governors, district, sub-district and village heads which means that military control of the population is twofold, through the army and through the civilian administration.

The 'sospol' function is further reinforced by the appointment of military personnel to key positions throughout the state bureaucracy, in central government departments, as ambassadors and in regional and local government.³ The military bureaucrats are known as *karyawan* (functionary), a term originally invented before 1965 to replace the word *buruh* (worker) which, according to military thinking, is dangerously linked to the idea of conflict and class struggle. Increasingly, however, the term has come to be associated with ABRI's 'sospol' functionaries.

The *karyawan* system originated under pre-1965 martial law and involves both active-service and retired officers who remain under ABRI discipline. Army commanders at every level of the hierarchical structure have 'sospol' assistants who are responsible for selecting military bureaucrats and making sure they comply with internal army regulations governing *karyawan* activities, throughout their term of 'non-military' office.

The irrelevance of political parties

When Suharto came to power in the mid-1960s, the first priority of his military task-force, the elite para-commandos, was the elimination of the left-wing movement under communist leadership, which by 1965 had a following of some 15 million. Once the left had been physically annihilated, the other political parties were subjected to massive

² See John MacDougall, *Indonesia Reports* (Maryland: Indonesia Publications) No. 14, p. 3 March 1986.

³ See MacDougall, *op. cit.*, for an analysis of the shifts in military penetration of the higher central bureaucracy since his earlier analysis of 1981.

military interference, bringing them into line with the political requirements of the regime. After the first post-1965 general elections in 1971, the surviving parties were forced to merge into two parties, one composed of the Muslim parties, the Partai Pembangunan Persatuan, United Development Party (PPP), and the other, an amorphous coalition of nationalists and the Christian parties, the Partai Demokrasi Indonesia, Indonesian Democracy Party (PDI). The requirement to merge was the first step towards divesting the parties of their separate political identities, and forcing them to dedicate themselves to supporting the government's policies and programmes. But it has always been a part of Suharto's scheme of things to retain the appearance of a multi-party system, staging general elections every five years, as if some kind of democratic system is in operation.

Every general election under Suharto has been stage-managed in such a way as to secure GOLKAR an overwhelming majority. GOLKAR is composed primarily of state functionaries and employees, all of whom are required to join the GOLKAR subsidiary, KORPRI, the association of state employees. In accordance with the doctrine of the 'floating masses' which asserts that people in the countryside must be protected from 'disrupting' political influences so as to devote themselves solely to productive endeavour, the two non-government political parties are prohibited from having branches in the villages and sub-district towns. However, GOLKAR's presence is assured because all local state functionaries are members of GOLKAR.

At all three general elections held since 1965, GOLKAR has enjoyed military support, along with massive funding from the state, support from the Interior Ministry and the help of central election and local polling committees which are heavily weighted in favour of GOLKAR. Faced with such an impressive electoral machine, the other parties have never been able to pose a serious challenge to the GOLKAR bulldozer. In addition, they have been subjected to widespread intimidation, as well as being forced to submit their lists of candidates to KOPKAMTIB scrutiny.

It should not be imagined however that GOLKAR, having won a general election, then takes office and runs the executive. It has been nothing more than an adjunct of the military, its electoral vehicle. It has provided the military regime with a loyal bureaucracy, and has been the institution capable of securing prestigious jobs for its members.

But in the more recent past, there have been some noticeable shifts in GOLKAR's position. Since the 1982 elections, GOLKAR has been

converted from a federated organisation, composed of disparate : fractious components run in most cases by retired army officers, into an organisation composed only of individual members. It now claims membership of ten million people, of whom the majority are said to have undergone cadre training. This re-organisation is aimed at making GOLKAR more independent of the army which, for its part, appears to have had enough of fighting GOLKAR's electoral battles. On the recently completed reorganisation of the Armed Forces, 'professionalism' is the buzz-word, coupled with training in the use of more sophisticated weaponry and the creation of rapid-deployment units ready to deal with local unrest. This means that troops are unlikely to be called upon to get too deeply involved in GOLKAR electoral campaigns, except of course for specific security duties before and after polling day.

Under the ambitious Lieutenant-General Sudharmono, head of the State Secretariat, who took over as GOLKAR chairman in 1983, there have been signs of conflict between GOLKAR and the Armed Forces. The most widely publicised was the dispute over the appointment of governor of Riau Province, a dispute that may have presaged moves by GOLKAR to win for itself more top positions in the bureaucracy. In the case of Riau, it was the army's man who won the appointment. But there are apparently reports circulating in Jakarta claiming that Sudharmono thinks that he will be able to stake a claim for the vice-presidency when Suharto is elected to a fourth term in 1988, if GOLKAR reaches its target of nearly 68 per cent of the votes in the 1987 elections.

Pancasila totalitarianism

The idea that the state must have its own ideology has bedeviled Indonesian political life for many years, since long before Suharto seized power. The set of five principles known as *Pancasila*—monotheism, nationalism, humanitarianism, decisionmaking through consensus, and social justice—was Sukarno's answer to pressure from some Muslim circles who were demanding a state constitution that would give Islam a privileged status. The principles were vague enough, or so Sukarno thought, to be acceptable to all the disparate political and religious beliefs. But as Sukarno, backed in those days by the army, constructed his system of guided democracy in the late 1950s, *Pancasila* was turned into a pledge of loyalty to the state leadership, without which parties would not gain official recognition.

Suharto has refined this tool of ideological conformity, using it beyond anything Sukarno could achieve to depoliticise Indonesian society. The 1985 Societies' Law making it mandatory for all organisations to accept *Pancasila* as their sole ideology or principle—*azas tunggal*—completed the process begun under Sukarno.

But this was not all. The militarised state then embarked on a major project of indoctrination, through compulsory, two-week *Pancasila* courses (known as P4) for all. Introduced initially in 1978 for state employees, the 1983 session of the upper legislative assembly extended the project to all citizens. The only people excluded are left-wing suspects and ex-political prisoners who, according to recent official statements, number no fewer than 1.7 million people. To allow such people to participate in P4 courses would imply their ideological rehabilitation and deprive the Army of the need to whip up campaigns of anti-communist hysteria against this 'latent danger'.

Suharto's choice for the ideological supremo in charge of this project was (retired) General Sarwo Edhie, the man who commanded the para-commandos at the time of the 1965–66 massacres. Sarwo Edhie has never made any secret of his personal role in the killings. There could hardly be more convincing proof of the indivisibility between physical and ideological terror.

The totalitarianism of Suharto's '*Pancasila* democracy' is most evident in the 1985 Societies' Law which gives the Executive unlimited powers to force organisations to merge, to examine their sources of funding, especially funds from abroad, and to suspend and dissolve them at will. Any organisation with a strong ideological commitment of its own has been dealt with by the well-tried expedient of interference. When the Islamic Student Association (Himpunan Mahasiswa Islam, HMI) showed signs of resisting the sole-ideology obligation, local branches were infiltrated or disbanded and new ones created, so that, by the time the HMI congress took place in March this year, it was ready to conform.

Members of the government have also gone to extraordinary lengths to ensure that social organisations are led by people amenable to government pressure. This was particularly evident at the HMI congress and in the congress earlier this year of the state-sponsored trade union federation, the SPSI. The PDI party congress even resulted in the party imploring the government to appoint its chairman for it, as conflict between delegates took the congress to the brink of physical disorder. Under the state-managed political system now entrenched in Indonesia,

social and political organisations have lost all pretence of independence from the executive.

The economic foundations of military power

Military control of the state bureaucracy has given officers and military institutions access to great wealth. The process started already in the late 1950s when Dutch companies that were seized as part of Indonesian confrontation with the vestiges of Dutch colonial power, were placed under military management. The burgeoning state sector turned military officers into businessmen or managers. The prime example of this was General Ibnu Sutowo, who was appointed President-Director of the state petroleum company Pertamina (then still known as Permina) in 1957, building it into a huge holding company with interests in commerce, insurance, transportation, real estate and shipping. When Pertamina collapsed in 1975, at the height of the oil boom, with foreign debts of around \$10,000 million, Sutowo lost his job but not his private fortune.

But the process of the Suharto family's enrichment took a somewhat different course. Suharto's alliance with business dates back to the 1950s when, as commander of the Diponegoro Army Division in Central Java, he promoted the concerns of several Chinese businessmen. Chief among them was Liem Sioe Liong whose interests flourished, particularly after Suharto took power. Liem started life as a small-time money-lender in Central Java and lent money to Suharto while he was still a struggling junior officer in the 1940s.

Liem's corporate power grew largely out of the profits of monopolies in clove imports (widely used in the popular kretek or clove-scented cigarettes) and flour milling granted in the late 1960s and early 1970s. The Liem empire has grown since then to include a major share of Indonesia's cement production, the largest private bank in the country, a controlling interest in Indonesia's major steel plant, plus holdings in offshore banking and commercial interests in Hong Kong, the Netherlands and California. The Liem family empire is estimated to be worth between \$2 billion and \$3 billion, which puts it among the wealthiest corporations in the world.

Members of the Suharto family, including Mrs Suharto, their three sons, their daughter, a step-brother and a foster-brother, plus many distant relatives, all own shares in Liem's enterprises. Thus, for instance, Suharto's son, Sigit and his daughter, Siti each own 16 per cent

of the shares in Liem's Bank Central Asia, while Mrs Suharto's several 'charitable foundations' receive a large share of the profits of Liem's Bogasari Flour Mills.⁴

Enriched by such profitable investments, Suharto's three sons have launched out on new ventures, and are now believed to have a controlling interest in at least thirty companies loosely gathered together as the Bimantara Group.⁵ Their attraction to multinational corporations keen to win major contracts lies in their ability 'to win control of licences and supply contracts, and [let] others execute them'.

There are many examples of state intervention specifically benefiting companies in which Suharto family members or hangers-on own shares. Liem's company, Indocement, was granted \$360 million last year in the form of a share purchase by the state to help it service its dollar debts, at a time when the cement market was hit by falling demand. Mercu Buana Raya, the contractor company owned by Suharto's step-brother, Probusutedjo, recently won two major parts of a \$700 million hydropower development for sub-contracting to a major French firm, while his son Tommy, through a new company SEWU, won control in 1984 of a sole licence to develop an offshore supply base on Batam island.⁶

The Suharto family wealth has long been a public secret but it is a subject regarding which Suharto displays extreme sensitivity. The most recent example was the enraged response to an article published in the *Sydney Morning Herald* on 10 April 1986 setting out the details of the Suharto-Liem tie-ups. The article contained little information that was new, much of it, in fact, having already appeared in articles about the Liem empire that were published several years ago in the *Far Eastern Economic Review*. The result however was the blanket exclusion of Australian journalists from covering Reagan's visit to Bali in May, the cancellation of visits to Australia by senior Indonesian officials, the threatened rejection of Australian military assistance, the sudden withdrawal of visa-free entry for Australian tourists (a decision that caused so much embarrassment that it was reversed 24 hours later), and the ejection from Indonesia of White House-based Australian journalists from Bali airport at the very moment President Reagan was being welcomed by Suharto.

The regime's insistence that everyone should defend Suharto against

⁶ *FEER*, 22 May 1986.

By the time this is published Winnie Mandela might well be back in prison, a possibility—and often a reality—with which she has lived for twenty-seven years. Never a great respecter of unjust 'laws', she has for several months been living in open defiance of them. Officially confined to a remote village in the Orange Free State, she has become an increasingly familiar figure on the world's television screens: giving interviews in Johannesburg and Cape Town, addressing a vast crowd in Mamelodi. Prohibited from being quoted and forbidden even to prepare anything for publication, she has provided the material for these two books. She has simply ignored explicit government orders to return to her place of banishment. With superb strategic sense and political judgement she has taken full advantage of the present virtually ungovernable state of South Africa completely to disregard the stringent restrictions imposed on her by the government and has contributed tremendously to the world's awareness of what is happening in South Africa. Perhaps her effect on camera had more to do with the government's news blackout than the effect of the cameras on the 'riots'.

The South African government relies on force and intimidation to impose its will. Winnie Mandela has shown that she has no fear and will not be intimidated. For almost thirty years she has been subjected to the most severe harassment. She was first imprisoned in 1958 and for the past twenty-three years has only been free of some sort of restriction for ten months. She has been banned, house arrested and banished; she has served terms of imprisonment and been subjected to long periods of detention without trial. But, as she herself says, 'When they do these things to you year in and year out, they actually make a politician out of you'. We only receive fleeting glimpses of what sort of politician she is from these two books, but her recent actions speak louder than any words could.

Neither of these books claims to be the definitive work on Winnie Mandela. The first is a very readable story—at times almost of a fairy-tale quality—which serves the useful purpose of informing a wider audience of the history and nature of the black struggle in South Africa and of the calibre of the people produced by it. The second gives the impression of being a hasty compilation of any material that was available. Nobody can be expected to write their biography through the medium of informal conversation. It is not an adequate vehicle through which Winnie can express her views. Nevertheless, it contains some powerful pieces by her, as well as some moving tributes from friends and some rare letters from Nelson Mandela. It is the first opportunity Winnie Mandela has had of publicly expressing her views at any length. These, obviously, deserve and need to be read.

the foreign investment fraternity centres on the regime's so-called high-cost economy, 'a euphemism for payoffs and trade practices that require dealings with Suharto-favoured companies'.⁹ These complaints were high on the agenda when President Reagan met Suharto in Bali in May this year.

What reason is there to believe that a regime whose leader has benefited so much from corruption will act effectively to stamp out the malpractices that are turning Western financial institutions and Western investors into such vocal critics? There were hopes last year that Suharto would use his exceptional personal authority to respond, when he took drastic measures to end corruption in customs and excise and clean up the harbours. In a presidential instruction (Inpres No 4), he turned over the duties of inspecting foreign trade and collecting import and export levies from the Directorate-General of Customs Duties (*Bea Cukai*) to a Swiss company, *Société Générale de Surveillance* (SGS), thus apparently undercutting the interests of many military and civilian hangers-on. This was seen at the time as a bold move, proving that Suharto could ignore the political consequences of damaging the interests of circles whose support has been so vital.

A year on, and it now turns out that Inpres 4 has done little to curb smuggling and corruption in the harbours. In desperation at the failure of his 'bold' move, Suharto turned to KOPKAMTIB, instructing it to treat violators of Inpres 4 as subversives liable to prosecution under the draconian anti-subversion law.¹⁰ Few people will believe that KOPKAMTIB can be any more successful than the SGS in curbing the cancer that undermines the economy.

It is clear that the retrenchment provided for in the 1986 budget is far from adequate to deal with problems being confronted. In a move to encourage more foreign investment, new measures introduced in May 1986 allow foreign companies to import materials needed in the production process rather than being forced to use higher-cost domestic products. The government has also greatly reduced the economic sectors that have for years been closed to foreign companies. At the time of the 1986 meeting of the Inter-Governmental Group on Indonesia in June, held to decide the next annual aid commitment from the West (the amount agreed was \$2.5 billion, a \$100 million increase on 1985), the World Bank made it clear that it would be pressing for yet more

⁹ *The Washington Post*, 2 May 1986.
¹⁰ *Jakarta Post*, 3 June 1986.

concessions for foreign investors, and for more austerity measures that will cut living standards and are bound to reduce the economy's ability to absorb the 1.9 million people who yearly swell the country's labour force.

The already impoverished workers and peasants will see a further reduction in their living standards, but in a way, this is no new experience. It is not easy therefore to argue that the present retrenchment will lead in the short term to a rising tide of protest in the countryside and the factories. But the impact on the middle-class beneficiaries of Suharto's 'seven fat years' is likely to be far more dramatic. Unlike the unorganised poor who have as yet failed to make sustained protest against the government, middle-class critics can find channels for their views in the press and can also take advantage of the fissures that appear to be occurring within the military establishment. For them, the issue of democratic rights is bound to take on a new significance. The regime has been preparing itself for this and it is now in the habit of listing 'liberalist thought and human rights advocacy' as the first of several 'extremist' ideologies threatening national security. The other two, according to BAKIN, are 'the extreme left' and 'the extreme right' or 'Muslim fundamentalism'.

Political opposition

Up to now, opposition to the Suharto regime has been spasmodic and fragmented. This is partly the result of the traumatic impact of the 1965 massacres and the regime's constant use of the communist bogey. Partly, it reflects the overwhelming presence and effectiveness of KOPKAMTIB, the agency of repression, and partly it is the consequence of years of relative economic prosperity for middle-class Indonesians.

The destruction of the pre-1965 left-wing movement in the wake of Suharto's rise to power was such that the chances of a left-wing revival in the foreseeable future are still minimal. The government nevertheless wages regular campaigns against 'ex-PKI [Partai Komunis Indonesia] suspects'. The latest version of the campaign, launched in 1985, is focused on the re-registration of all former political prisoners and alleged former PKI members or sympathisers, allegedly to decide who will be allowed to vote in the 1987 general elections. The main purpose of re-registration is to remind all Indonesians of this 'latent danger'. Reports frequently appear in the press about the number of 'suspects' if

each region of the country. In addition, publicity is regularly given to the discovery of alleged PKI sympathisers still occupying positions in government departments, schools, the media or other 'sensitive' places.

There have been many dismissals of people who for twenty years were allowed to remain in their jobs. More than 6,000 employees of several oil companies were dismissed late last year for alleged membership, prior to the Suharto take-over, of trade unions that were outlawed in 1965. The prison service is currently being subjected to a purge of 'PKI suspects', largely to make way for retired army personnel.

The anti-communist campaign not only creates the illusion of a growing security threat as the 1987 elections draw near. It also has the effect of intimidating people against taking action to protest at falling living standards and growing impoverishment in the countryside and the cities.

Since the early 1970s, several attempts at protest have been made by intellectuals raising the banner of free speech, the right of assembly, and criticising the extremes of poverty and wealth, land dispossession and widespread corruption. The student protests of 1974 and 1978 failed however to establish any momentum and were dragged down by damaging, intra-regime conflict. After the 1978 student protest movement, the government set about paralysing the campuses by means of a programme of depoliticisation. As a result, the student movement has been effectively emasculated and the occasional outbursts of discontent that have occurred on campuses have been quickly neutralised.

The one dissident movement to show resilience and staying power is the Petition-of-50 Group launched in 1980 with a 'Statement of Concern' challenging Suharto's interpretation of the army's *dual-function* and rejecting his claim to be the sole arbiter of the meaning of the *Pancasila* ideology. The group, comparable to Czechoslovakia's Charter '77 movement, consists of politicians of pre-1965 eminence who yearn for a return to the traditions of the multi-party system, along with retired senior Armed Forces officers unhappy with Suharto's style of militarism. The group meets regularly and has issued pronouncements on many issues, none of them published in the Indonesian press. The members are prevented from airing their views in the media, and lack grass-roots support. The group's boldest challenge to the regime came in 1984 when it issued a White Paper challenging General Murdani's version of the Tanjung Priok massacre in September that year. This stand brought the group into open conflict with the Armed Forces

leadership, and resulted in several members being arrested and charged for alleged complicity in the Muslim unrest which has now become the regime's prime target.

Rebellious Islam

Muslim opposition has been a force to be reckoned with since the mid-1970s. In some parts of Java where Islam absorbed much of Java's pre-Islamic tradition, Muslim organisations like Nadhatul Ulama and Muhammadiyah have been willing to accommodate to the various regimes in power since pre-war days. But elsewhere, where devout Islam was reinforced by a reformist movement earlier this century, it has been far less accommodating to state power and has been basically disillusioned with the highly centralised state machinery favoured since Dutch colonial days. As a result, Islam has for decades been sympathetic to the ideas of regional autonomy or even secession which enjoyed support in several parts of the country during the first two decades after independence. In Aceh, West Java and South Sulawesi, regionalism joined forces with movements for an Islamic state. This has led to a historic antagonism between non-Javanese Islam and the Armed Forces, always the most vigorous proponents of centralisation and the unitary state.

For some years after 1965, political Islam held on to the illusion that the PPP (Partai Persatuan Pembangunan, Development Unity Party), the merged Muslim party which was allowed under the regime's terms to engage in limited political activity, could be a vehicle for political action. Since 1978, that illusion has evaporated. In many parts of the country, Muslim congregations have developed their own independent structures, helped along by itinerant preachers and mosque-based youth committees that are critical of many aspects of government policy and resentful of the limitations on freedom of speech.

Protest became particularly vociferous in 1984 following publication of the draft Societies' Law which Muslims recognised as being directed specifically against them. The movement was under no identifiable leadership. Many mosques had become platforms for political agitation despite the efforts of the security forces to ban certain preachers and enforce a system of licensing on those allowed to preach. The Korp Mubaligh Indonesia (Indonesian Lay-preachers Corps, KMI) whose chairman is Sjafruddin Prawiranegara, a former prime minister, has

many outspoken members, functioning as itinerant preachers who became very popular among mosque congregations.

In September 1984, troops in Tanjung Priok, Jakarta's dockland, fired on thousands of demonstrators who were demanding the release of local mosque officials held by troops. General Benny Murdani, who was in Tanjung Priok at the time, overseeing the operation, claimed the next morning that nine people had been shot dead, and that 'armed' demonstrators had set out to attack a military command post that was protected 'by only fifteen soldiers'. But eye-witness accounts soon circulated privately, giving a very different version.¹¹ The army clamp-down on information, coupled with strict orders to the press to confine themselves to official accounts, made any independent investigation of the affair impossible. But reliable sources in Indonesia believe that several hundred people were killed—according to one source, as many as six hundred—many of whom were later buried by the military in a mass grave. The Tanjung Priok incident bore all the hallmarks of an intelligence operation, and was staged just as the issue of making *Pancasila* mandatory was causing considerable unrest.

Murdani's distorted account of the Tanjung Priok massacre provoked an outburst of protest and the dissemination of leaflets contradicting Murdani's claims. There were hundreds of arrests, among them leading members of KMI. Since December 1984, hundreds of people have been tried, among them severely wounded victims of the Tanjung Priok massacre, lay-preachers, and activist Muslims allegedly involved in bombing incidents that occurred shortly after the massacre. The wave of trials is intended as a display of Murdani's 'get-tough' policy towards unruly Muslims, but they prove the depth of the regime's paranoia about the level of unrest.¹²

Some of the trials have boomeranged because of defence lawyers' efforts to expose the true facts about Tanjung Priok. This concerns not only the high death-toll and the callous shooting-down of unarmed people, but also revelations that could prove military complicity, provoking a demonstration that had such tragic consequences. The most outspoken of these lawyers, Buyung Nasution, has since been charged with contempt of court and is in danger of losing his licence to

¹¹ See in particular 'Bloody Wednesday Night in Tanjung Priok' in *Indonesia Reports* No 3, January 1985, Politics Supplement, pp 1-9

¹² *TAPOL Bulletin* No 75, May 1986 reports that 129 convictions are known to have been passed, since December 1984, and gives a breakdown of sentences and type of cases

practise. In its case against Buyung, the judiciary is showing yet again how it serves the political needs of the regime.

The exceptional thing about Buyung Nasution and other human rights lawyers associated with the Legal Aid Institute is that, unlike the Petition-of-50 Group, they can still use the press as an outlet for their views and criticisms. Indeed, the courtrooms have become the only official platform for the public expression of anti-government opinion.

Indonesia's colonial wars

West Papua fell under Indonesian rule in 1963, under the terms of an accord, the New York Agreement, concluded between the Netherlands and Indonesia as the result of mediation by Washington, and endorsed by the United Nations. The accord dashed Papuan hopes for independence. Resistance to Indonesian rule soon took the form of armed struggle. The referendum held in 1969 violated the terms of the New York Agreement. The Indonesian authorities allowed only 1,025 hand-picked chieftains to take part. To its shame, the UN General Assembly accepted this as an act of self-determination, despite overwhelming evidence of the use of force to prevent protest against this so-called Act of Free Choice. Since then, the UN has turned its back on the West Papuan people.

Indonesian administration of West Papua has been repressive and racist, intensifying opposition throughout what is now called Indonesia's province of Irian Jaya. An aborted uprising in Jayapura, the provincial capital, in February 1984, resulted in some 12,000 Papuans fleeing across the border to Papua New Guinea. The problems of West Papua have been further aggravated by Jakarta's plan to re-settle hundreds of thousands of landless Javanese and Balinese peasants in the territory, seizing without compensation vast areas of land used for generations by tribal people.

Although the West Papuan guerrillas fighting with the Organisasi Papua Merdeka (Free Papua Movement) are poorly armed, they enjoy the advantage of mobility, familiarity with the tropical rain-forests and the support of the tribal people. The 1984 attempted uprising proved moreover that support for the OPM is widespread among city-based Papuan intellectuals and among Papuans serving in the Indonesian army.

Jakarta is particularly concerned about consolidating its hold along the eight hundred kilometre border with Papua New Guinea, but it is

precisely in this region that the guerrillas have proven capable of sustained military operations against army and police outposts. Since the last quarter of 1985, they have launched a number of audacious attacks on Indonesian military positions, forcing Shell, for example, to halt seismic studies along the north coast, west of Jayapura.

East Timor, formerly a Portuguese colony, stood on the threshold of independence in 1975. But nine days after the Democratic Republic of East Timor was proclaimed on 28 November 1975, Indonesian troops invaded, unleashing a war of devastating proportions. Armed resistance organised by Fretilin, the Revolutionary Front for an Independent East Timor, held back the forces of occupation for several years, until the Indonesian Armed Forces, re-equipped with OV-10 Broncos and A4-Skyhawks from the US, were in a position to bomb the resistance out of their defence positions, and force the people of East Timor to leave the mountainous interior. The death toll in the first four years of the war is estimated at 200,000, nearly a third of the population.

Despite this serious setback, organised resistance resumed within a year and has been sustained ever since, holding down around 10,000 Indonesian troops. In March 1983, contradicting its own claims that Fretilin was a spent force, the Indonesian military command in East Timor entered into negotiations with the Fretilin commander, Kay Rala Gusmao Xanana. But military operations were resumed, following a ceasefire lasting five months. Murdani launched a new offensive in August 1983, claiming that he would finish off the resistance 'once and for all'. Three years later, he is no nearer to that objective. In fact, information from both sides of the battle lines, from Fretilin maps as well as from a captured Indonesian intelligence map, reveal that resistance bases exist throughout East Timor.

In both West Papua and East Timor, the Indonesian army has proven incapable of coping with armed resistance and guerrilla tactics. Nor has the doctrine of territorial management been successful among Papuans and Timorese who have not responded to Indonesian 'hearts and minds' campaigns. These two wars sap the energies of the Indonesian Armed Forces. It is estimated that around one-third of its elite troops are tied down at any one time in East Timor, while the same elite forces are frequently called upon to spearhead operations against the OPM. Both wars have proved the inability of Indonesia's army to fight against guerrilla forces even though waging guerrilla war stands at the heart of Indonesian military doctrine. This is a source of considerable dissatisfaction inside the military. Many recognise it as 'Murdani's war'.

He commanded the first operations and, eleven years later, he has still not been able to provide the victory he has so often promised. These criticisms could well be used against him by his many rivals.

Neither the OPM nor Fretilin have the capacity to inflict military defeat on the Indonesian army, but they do represent the most sustainable opposition in Jakarta-based militarism.

Jakarta's regional ambitions

Indonesia's membership of ASEAN has not been at all times harmonious. Unlike other ASEAN allies, particularly Thailand, ABRI has a different perception of superpower politics in Southeast Asia. This is based primarily on ABRI's hostility towards China which it still accuses of collusion with the PKI in the final years of the Sukarno presidency. Twenty years on, Indonesia still resists calls for the re-establishment of diplomatic relations with Beijing which were broken off in the aftermath of events in Jakarta in October 1965. ABRI has, for this and other reasons, sought a closer tie with Vietnam and engages in regular dialogue with the Vietnamese leadership. However, its efforts to act as 'honest broker' to facilitate Vietnam's withdrawal from Cambodia have come to nothing.

Since 1983, Suharto has not concealed his eagerness to be acknowledged as a world leader, and particularly to put Indonesia back on the map as a leading non-aligned power. Several major events were held in Jakarta to promote this objective. In January 1985, Indonesia hosted the meeting of Information Ministers of the Non-Aligned Movement, and three months later, it convened what turns out to have been an uneventful get-together of African and Asian government leaders, to mark the thirtieth anniversary of the 1955 Asian-African Bandung Conference. These events were expected to culminate in a successful move to secure the presidency of the Non-Aligned Movement. The bid failed however, because East Timor was taken up at the August 1985 meeting of non-aligned foreign ministers in Lusaka and is certain to be discussed at the summit meeting in Harare in 1986. It has become an accepted principle that countries whose policies put it into conflict with other members of the Movement cannot assume the presidency.

There have been clear signs for several years that Indonesia now believes it should assume a position as a Pacific power, that it should be looking more towards the states to the south-east as well as to its Asian

neighbours to the north, becoming, as it were, the bridge between the South Pacific and Southeast Asia. This new ambition is spurred on by the awareness that support for West Papua and East Timor is growing among the people and governments of the South Pacific. In fact, these two annexed territories have provided Indonesia with the excuse to become a Pacific power.

The continual OPM challenge to Indonesian positions along its border with Papua New Guinea has also made it imperative for Jakarta to enter into a long-term agreement with Port Moresby, that would deal not only with border patrols as at present, but would press on Port Moresby Jakarta's determination to keep the whole border area free from OPM operations.

But perceptions of Indonesia in Papua New Guinea and in the South Pacific are not favourable to these ambitions. The fear of an Indonesian invasion is never very far from the surface in Papua New Guinea. Moreover, Jakarta forgets that the spirit of independence is strong among the people of the South Pacific. There is no reason to believe at present that Jakarta will be any more successful in its new South Pacific policy than it has been in its bid for the leadership of the Non-Aligned Movement.

Indonesia and the Reagan Administration

While Suharto's fervent anti-communism, his successes in suppressing unrest and in providing foreign capital with the necessary facilities to exploit the country's wealth have always assured him Washington's support, US-Indonesian relations have been dogged by problems. The US continues to be ABRI's primary source of military equipment, though it is symptomatic that Washington held out for several years before eventually agreeing to supply F-16 aircraft to Indonesia. Jakarta is wary of Washington's close relationship with Beijing and tries to distance itself, at least publicly, from Washington's Middle East policy, preferring to project a pro-Arab image, though it is now common knowledge that Indonesia has purchased military aircraft from Israel.

The Indonesian Armed Forces exude an extreme brand of nationalism which does not advance the cause of close US-Indonesian ties. Nor is it a stance that has the support of Indonesia's Foreign Minister, Mochtar Kusumaatmaja, who often finds his international positions, particularly in ASEAN, undermined by Armed Forces initiatives in foreign affairs. The prime exponent of nationalism at present is General Murdani, described privately by some Indonesian

dissidents as a latter-day Sukarnoist. The most vivid example is the débâcle of Reagan's visit to Bali on his way to the Tokyo Summit in May. Murdani successfully used the conflict with Australia, instigated by the *Sydney Morning Herald's* attack on the Suharto billions, as the instrument for causing a major diplomatic row when members of the White House press corps were refused entry into Indonesia because they were Australians, despite vigorous efforts by the US Ambassador, Paul Wolfowitz, to reverse the decision.

Murdani arguably has several reasons for making a public display of his unwillingness to bow to American pressure, some of which have already been mentioned. The growing pressure on Jakarta to make major concessions to foreign investors, and Washington's dissatisfaction that ABRI has still been unable to crush Fretilin in East Timor only add to Murdani's sense of affront. There are even reports circulating that Ambassador Wolfowitz is privately lobbying to find a 'third force' in Indonesia, not least among the dissidents now ranged against the regime.

The recent belligerence of the Armed Forces leadership towards both Washington and Canberra probably reflects a more deep-seated conflict within the regime itself. Murdani, the powerful, has seen the post of Army Chief-of-Staff go to Lieutenant-General Tri Sutrisno, not the man of his choice. He may well be becoming more uncertain of the loyalty of the younger generation of generals now taking over top positions throughout the army. True, these are men whose promotion he himself has supervised, but the Armed Forces reorganisation carried out since he became Commander-in-Chief in March 1983 has caused difficulties in the upper echelons of the military establishment, not least because of the drastic reduction in openings for flag officers, now that the number of divisional commands has been reduced from seventeen to ten.

The economic crisis can only exacerbate the tensions. While the Western powers have demonstrated their continuing faith in the regime by agreeing at the June 1986 meeting of the Inter-Governmental Group on Indonesia to advance Indonesia yet more economic aid to the tune of \$2.5 billion, it is not too far-fetched to postulate that many analysts in the West are secretly worried about political changes that could take place in Jakarta. Suharto is the world's second longest-serving military dictator, after Stroessner of Paraguay. While Indonesia still remains obscure to the general public in the West, many of the ingredients are present for some major upheavals in the not-too-distant future.

Haiti: the rise and fall of Duvalierism

Referring to the period between the death of Pope Leo XIII and the election of his successor, the Irish Jesuit George Tyrrell wrote to a friend, 'The ten days interim, when there was no infallible authority on earth, were the happiest of my life'.¹ Haitians are today enjoying one of these rare springtimes of freedom between the departure of one president and the election of another. After almost thirty years of ruthless repression in this country of roughly six million people, all things are possible. New parties are forming, newspapers of all kinds are appearing and the situation is highly volatile. In this article I wish to consider why the Duvalier dynasty rose and fell, then to look at some of the forces now at work in the republic. I shall suggest that the main reason for the political demise of Jean-Claude ('Baby Doc') Duvalier was a shift in the basis of his support from one class to another. This made him susceptible to pressure from several directions: from the movements of mass protest, from the church, and finally from the US Navy and the army.

The regime of 'Papa Doc' (1957-71)

François Duvalier was elected President in September 1957 after a violent campaign of many months. He proclaimed himself the spokesman of the masses and of the black middle class. His principal opponent was seen as the candidate of the bourgeoisie, generally opposed by the Roman Catholic hierarchy and by the US Embassy. While the army clearly played an important role during the election campaign, and effectively eliminated some of the candidates, it is likely that the victory of Duvalier reflected popular sentiment at the time. In particular he had secured support from key groups of middle-class blacks, in the capital and in the countryside. Duvalier strongly emphasised the colour issue, exploiting the fact that in Haiti as in other parts of the Caribbean there has been, since colonial times, a general

D Petre (ed), *George Tyrrell's Letters*, London: T. Fisher Unwin, 1920, p 160.

coincidence between colour and class, so that most of the rich are mulatto and most of the poor are black. There has hardly been an important issue in Haiti where colour has not played a part; it is never the sole factor, and is not always the dominant factor, but colour is rarely absent.²

Having temporarily reassured the US and the bishops that he was sympathetic to their interests, François Duvalier ruthlessly repressed all attempts by his opponents to challenge his position and skilfully eliminated the most dangerous elements in the army. In the course of the following years he dealt severe blows to all potential centres of political opposition, including the intellectuals (school teachers, students, professors and journalists), the church hierarchy, the US Embassy, critics within his own party and trade union leaders. By 1964 he was able to have himself declared President-for-Life, to write a new autocratic Constitution and to change the Haitian flag to black and red (a symbolic aim he had cherished for many years). This flag—the flag of Dessalines and Christophe—was said to reflect a new ‘equilibrium’ in which the blacks would control power in a country where a light-skinned elite had generally been dominant. This was the so-called ‘Duvalierist revolution’.

From the mid-1960s onwards, however, the dictator reached an accommodation with the business community, with the US (after the death of Kennedy) and with the church hierarchy. Businessmen were assured by the government that they could continue to make money, so long as they refrained from direct political action; US aid was resumed and new—indigenous and docile—bishops were appointed. Papa Doc was nevertheless careful to keep close contact with those middle-class blacks who had originally supported him, many of whom were *houngans* (Voodoo priests) and local leaders of his civilian militia, the *tontons macoutes*. Despite occasional attempts by exiles to invade and sporadic outbursts of popular discontent—particularly among peasants of the Artibonite valley—Duvalier was firmly in control of the country and was able in 1971, just before his death, to hand over power to his teenaged son.

Overseas observers were surprised that a peaceful succession was achieved. There are a number of reasons for this. In the first place they failed to recognise that Papa Doc—by a combination of terror, populist rhetoric and the adroit distribution of the small amounts of patronage

² See David Nicholls, *From Dessalines to Duvalier*, Cambridge: Cambridge University Press 1979, and *Haiti in Caribbean Context*, London: Macmillan 1985, chapters 1, 3 and 12.

at his disposal—had retained widespread support (or at least acquiescence) among the key black middle classes. The business community and US Embassy concluded that a smooth transition was preferable to the likely alternative of disorder or even the possibility of a radical government. Finally, all potential centres of opposition had been disabled with their leaders in exile, in prison or dead.

Jean-Claudisme (1971–85)

With the help of his mother the new President was able to maintain power and to accelerate the policies of accommodation adopted by his father. Some of the more scandalous activities of the *macoutes* were curbed and gestures were made in the direction of a liberalisation. 'Jean-Claudisme' was widely portrayed as aiming to achieve an economic revolution, by a process of modernisation. Washington was generally favourable to the new regime and encouraged private investment in the growing sector of light industry and assembly plants. The early 1970s was a period of relative economic prosperity. Agricultural production grew, tourism revived and investment increased. Real growth in the economy reached 5 per cent per annum and the US Embassy confidently pronounced that the Haitian economy 'is in the process of recovery'.³

Jean-Claude Duvalier had lived most of his life in the presidential palace and lacked his father's intimate knowledge of the country. The regime gradually lost support from many of the black middle classes and came increasingly to depend on the support of the business community. Demands for improvements in the economy and the need for foreign aid meant that new technologically oriented men, who could speak the language of the World Bank, like Henri Bayard and Marc Bazin, were brought into the government. These men were, however, unhappy about working with the old guard Duvalierists and *macoutes*. For years the President attempted to retain support of both groups, but by the early 1980s many of the black middle-class supporters of François Duvalier had come to the conclusion that there was nothing for them in the regime of Jean-Claude.⁴

While it would be wrong to attribute all the problems of Baby Doc to

³ *Economic Trends: Haiti*, US Embassy, Port-au-Prince, 1973.

⁴ William Paley, 'Power shift imperils Haiti's trail stability', *The Guardian* (London) 13 January 1982.

his marriage, and to blame Michele Bennett for his political demise, the president's growing dependence upon a corrupt clique headed by Ernest Bennett, was viewed with alarm by different sectors of the population. Well-established and influential members of the business community disliked the privileges accorded to this *arriviste*—as they saw him. The old guard of black Duvalierists saw the situation in terms of a revival in mulatto influence. Undisguised profiteering by the Duvalier-Bennett entourage, with hundreds of millions of dollars leaving the country into private bank accounts and an extravagant life-style at home, disgusted all sectors of the population. The bourgeoisie, upon whom the regime had come increasingly to depend, began to look around for alternatives.

Some degree of what might be called corruption, sufficient to enable an ex-President to spend his declining years in reasonable comfort abroad, is an accepted part of Haitian public life. Jean-Claude Duvalier and the Bennetts, however, overstepped the limit, and efforts are now being made by the authorities to track down the embezzled money and to reclaim it. Duvalier and his cronies were given temporary asylum in France and initially stayed in a luxury hotel on Lake Annecy, not too far from the prison where Toussaint Louverture, the black leader of slave liberation, died in 1803. The French Government has tried to remove Duvalier, but their own laws are making this difficult. He has since moved to a house in the Riviera.

In the late 1970s, President Carter had put considerable pressure on Haiti to liberalise its political system and opposition groups began to organise, openly voicing cautious criticisms of the administration. Although a number of independent journals appeared, influencing opinion among students and intellectuals in the larger cities, the major role was played by various radio commentators, whose caustic observations on government corruption and inefficiency were listened to by illiterate (though by no means unintelligent) peasants throughout the countryside. With the election of Ronald Reagan, Jean-Claude felt he could safely repress these opposition movements, but the spell had been broken. Opposition continued to be manifested from such men as Sylvio Claude, Gregoire Eugène, Gérard Gourge and Gérard Duclerville. Many of these men were arrested and tortured but bravely refused to leave the country.

Popular protest

One of the significant features of the movement which eventually led to the downfall of Duvalierism was that it had its base not in the capital but in provincial towns like Gonaïves, Petit Goâve and Jérémie. For the first time since the United States occupation of Haiti, which ended in 1934, a major political movement has begun outside Port-au-Prince. Throughout the nineteenth century many governments had been toppled as a result of rural guerrilla activity by the *cacos* or *piquets*, as they were called.⁵ Armed resistance to the US occupation was also based in the countryside.⁶ One of the consequences of the occupation was to disarm the peasants and to centre economic, political and cultural life in the capital. While François Duvalier (as we have seen) and his mentor President Dumarsais Estimé (1946–50) derived much of their support from the provinces and rural areas, life continued to be centred in 'the republic of Port-au-Prince'. Yet in a curious way the organisation of *tontons macoutes*, by recruiting many thousands of rural Haitians, incorporated them—at least symbolically—into the civic life of the nation. The rhetoric of Duvalier continually proclaimed that the peasants were the real and important element in the country. Nothing was further from his intention than to allow them any material influence in national affairs, yet—as I observed in 1979—'If people are told often enough that they are important, they may begin to believe it.'⁷

Popular protests against particularly ruthless and corrupt *macoute* leaders go back to the late 1960s, but became increasingly significant under Jean-Claude Duvalier. Efforts to re-establish the reputation of the government in the rural areas failed. Popular discontent increased in the 1980s because of the decline in agricultural production, food shortages due to drought, and the end of the migration of 'boat people' to the US.

Added to this was the plague of swine fever and the compulsory slaughter of the pig population, supervised by the Organisation of American States, which was believed by many peasants to be part of a conspiracy. The hardy black pigs fed largely on garbage, were a basic

⁶ See Roger Gaillard's seven volumes *Les blancs débarquent*, Port-au-Prince: published by author, 1972 onwards; and Kethly Millet, *Les paysans haïtiens et l'occupation américaine, 1915–1930*, LaSalle, Québec: LaSalle Collectif Paroles, 1978.

⁷ David Nicholls, *From Dessalines to Duvalier*, *op. cit.*, p. 237.

The influence of the Roman Catholic church and of some Protestant churches was significant at another level. For many years local parishes had been sponsoring, often with aid from international agencies, various development projects and cooperative enterprises. Small groups of peasants had been meeting to discuss local problems and to organise social action. The intention of the organisers of these projects was not usually political in the immediate sense and indeed these developments were attacked by radical exiles as conservative in their effects—enabling peasants to put up with a situation which would otherwise be intolerable.¹¹ Yet it was precisely from these groups that leaders emerged who were to challenge the regime in recent months.

It would be unduly cynical to view the role the church in the last few years merely as a revenge for the humiliation suffered under François Duvalier or as part of an attempt to re-establish its former role as a major political force in Haiti by siding with the growing opposition movement. While these considerations may carry some weight, it is undoubtedly the case that many parish priests and some of the bishops have genuinely and sincerely identified themselves with the cause of the poor and oppressed people of the country. The church constitutes one of the few Haitian institutions to have retained sufficient credibility to act effectively in the situation.

The church's role in the revolution is graphically portrayed in huge, generally anonymous murals which have appeared throughout the country, celebrating the *dechoukaj* (uprooting of Duvalierism). Some murals picture Christ, the liberator, breaking the chains of the people. Many of them celebrate Radio Soleil, with huge pictures of the sun, or portray the Pope with the words 'on our side'. Others show the Last Supper, with Judas often named as the local *macoute* leader.

Voodoo, an amalgam of various West African religions, incorporating certain Christian elements, is the religion of the Haitian masses. Although like all religion its social effect is generally conservative, there have been occasions when it has played a more radical role. One of the important contributions of Voodoo has been to perpetuate the consciousness of an African identity on the part of the masses. François Duvalier had been able to exploit this fact and secured

¹¹ See for example J-M Paré, 'Dimension politique de fait religieux en Haïti', *Nouvelle Optique* (6-7) 1972, pp 5f. But, as I remarked in 1979, 'Although the explicit political intention of the sponsoring agency has normally been conservative the unintended effects of these projects may turn out to be more radical than their patrons have calculated'. *From Dessalines to Duvalier*, *op. cit.*, p 246.

support from a number of *houngans*. It should, however, be emphasised that not all Voodooists supported the regime.

Protestantism goes back to the early days of independence and perhaps 15 per cent of the population would claim to be Protestant. Today the Baptist churches are in a majority and most of them would claim to be non-political. Nevertheless, some of the leaders of the opposition in recent years, including Sylvio Claude, have been ministers. Many Protestant churches are run by American missionaries who generally act as unofficial agents for US interests in Haiti. The Episcopal (Anglican) church is financially controlled from New York, though its bishop and parish clergy are all Haitians. The former bishop was a close friend of François Duvalier and a number of erstwhile Duvalierists were Episcopalians, including Jean Magloire, Victor Nevers Constant, the Bennett family and Father Emmanuel Moreau (who later, as a senator, opposed the dictator and was put to death).

The army

In the crisis which culminated in the flight of Baby Doc in February 1986 the army was manifestly the only body which could assume the government of the country, yet the unwillingness of the army to take such action is a notable feature of the situation. Under François Duvalier the military had been brought firmly under civilian control and army officers with political ambition were swiftly removed. In this way he attempted to reverse a tradition which goes back to the foundation of the state in 1804. Independence had been achieved by military struggle and it was the generals who succeeded to political power. For over one hundred years Haiti's head of state was invariably an army officer. Militarism pervaded the whole administrative structure of the country and this ethos was reflected in the Voodoo religion, where many of the *lwa* (spirits) were portrayed in the uniform of French eighteenth-century officers.

Despite attempts by the US occupation to form a professional and depoliticised army, it was not long before threats of a military coup again became real. In 1946, 1950 and 1956-7 the army played a key political role in the termination of one regime and the initiation of another. While both mulattoes and blacks were to be found among the officer corps, the mass of the army was, of course, black. Throughout the nineteenth century the army was one of the few institutions in Haiti which facilitated the rise of poor non-elite blacks to positions of power and ultimately to the presidency. Consequently, militarism was the

object of attack by mulatto politicians, who saw it as opening the way to dictatorship by uneducated blacks.

Although François Duvalier removed any officer—black or mulatto indiscriminately—whom he saw as constituting a potential threat, many of those promoted to fill the place of these men were blacks, who owed him personal allegiance. He also ensured that the military forces formed distinct hierarchies ultimately responsible to the President himself, rather than to some one supreme commander. In this way the presidential guard, the police, the small navy and air force and the regular army could each keep an eye on what the others were doing. In addition there was the considerable force of *tontons macoutes*, most of whom were organised into the *Volontaires de la Sécurité Nationale* (VSN), with branches throughout the country. These men were encouraged, rather as were the SS under Hitler, to watch out for any signs of disloyalty on the part of the armed forces.

As a result of this carefully arranged structure, Jean-Claude was able to forestall any possibility of a military coup. Nevertheless he gradually lost the support of many *macoute* leaders who, by the early 1980s proclaimed that they were unwilling to stick out their necks very far to defend the regime. By November 1985 there was considerable disillusionment and confusion in their ranks. The dismissal of the Minister of the Interior, Roger Lafontant, some weeks earlier was strongly resented by his *macoute* supporters. One of the notable features of the events culminating in the flight of Duvalier was the relatively insignificant role played by the VSN. Only in the final days did some of them rally to the President and make a violent attempt to suppress the movement. What would have occurred if Baby Doc had refused to leave the country is a matter for speculation. More bloodshed would undoubtedly have occurred but the VSN was sufficiently disoriented to prevent it from acting decisively.

Despite the drift towards disorder in January 1986, the army leaders were clearly unwilling to act independently to take over the country. A new generation of officers had grown up during the twenty-nine years of the Duvalier dictatorship for whom the notion of an army coup was practically inconceivable. François Duvalier had been able to claim by 1964—with some justification—that he had removed the army from its role of arbiter of political events. It appears that General Namphy's eventual agreement to head a junta was the result of persuasion by the US Embassy, by some Haitian politicians and by Jean-Claude Duvalier himself.

Foreign relations

The United States played an important part in maintaining Jean-Claude Duvalier in power and it was not until the final days that Washington decided to cut its losses and use its influence to secure the departure of the President. Even then US opinion was divided and it is widely believed that the advice being given by former Ambassador Ernest Preeg was that Washington should persuade Duvalier to remain and help shore up the regime.

Ever since Haiti's independence, foreign powers have taken a close interest in the affairs of the republic. In the early years France hoped to regain its wayward colony and it was only in 1825 that Haitian independence was recognised by the former metropolis. The United States and Britain were keen to trade with Haiti, and during the Napoleonic period the latter encouraged the Haitians to resist French overtures. Throughout the nineteenth century the US was, however, eager to minimise European involvement in Haiti and at times sought to establish a naval base at the Môle St Nicolas. In the years prior to World War I, the US became particularly worried about German activities in Haiti. The overseas commerce of the country was dominated by German firms and shipping lines; the German colony in Haiti was becoming increasingly involved in the internal politics of the country, by backing particular candidates for office in exchange for commercial favours. This, together with a general desire for strategic control of the region and the wish to find a safe field for foreign investment, resulted in the US decision to invade and occupy Haiti in 1915.

The occupation of almost twenty years had a number of important consequences. The mulatto elite was re-established in office, the black urban middle class was strengthened, the peasants were eventually disarmed, communications were improved and power was more and more centred in the capital. The Constitution was changed to allow foreign ownership of land and to facilitate foreign investment. Large numbers of peasants who had been squatting on state land for generations were removed and land concessions were made to US companies. Yet attempts to create a plantation economy on the model of Cuba and Puerto Rico failed, partly owing to resistance from the peasants and to the difficulty of establishing uncontested rights to land ownership. A further consequence of US Caribbean policies at this time was a significant migration of Haitian cane-cutters to Cuba and the Dominican Republic.

Although US marines were withdrawn in 1934, a financial administrator remained until 1946 and a strong US presence has continued since then. The Haitian *gourde* has for many years been tied to the US dollar, although today an informal 'parallel market' exists. The US is Haiti's principal trading partner and the relationship has intensified with the growth in the last twenty years of light industries and assembly plants making goods for export to the US.

In the elections of 1957, Washington clearly preferred a victory for Louis Déjoie, but regarded Duvalier as an acceptable president. On taking office he invited Washington to send a marine mission to help train the Haitian military, thus reassuring the US government of his reliability. Irregularities in the administration of foreign aid, the strong-armed tactics of the *macoutes* and Duvalier's determination to remain in office after his original term, led to tensions with the US and eventually to attempts by President Kennedy to remove Papa Doc. Economic pressure was brought to bear and the US gave support to attempted invasions by Haitian exiles. Duvalier survived and with the advent of Presidents Johnson and Nixon aid was resumed and Haiti was once more regarded as a member of the 'free world'. As I have noted, the US played an important role in the transition to power of Baby Doc and has generally given support to his regime, though at times using its influence to encourage a certain liberalisation in the political system.¹² This is the background against which the much-vaunted US role in the removal of Jean-Claude Duvalier must be seen.

The political crisis and the economy

Haiti remains an essentially agricultural country with a large proportion of the population living in rural areas and small towns. The majority of the people live on tiny plots of land owned by themselves or members of their family and eke out an existence by growing crops for local consumption and small amounts of coffee which they sell for cash. The coffee trade has been controlled by a fairly small number of export houses who buy from *spéculateurs* to whom in turn the peasants sell.¹³ Owing to the system of inheritance, whereby a peasant's land is divided among all his children, plots are getting smaller and serious soil erosion has occurred throughout the country. Small industries, making shoes,

¹² Ernest H Preeg, *Haiti and the CBI: a Time of Change and Opportunity*, Miami: University of Miami, 1985.

¹³ Christian Girault, *Le commerce du café en Haïti*, Paris: Paris CNRS, 1981.

soap, flour, cement, essential oils and other domestic goods have existed for many years and more recently, as we have noted, foreign-owned assembly plants and industries have arrived, mostly in the capital. These produce electronic goods, garments and such things as children's toys, baseballs and brassieres.¹⁴ Until recent months these latter employed roughly 60,000 people, the majority being women. Other exports include sugar, sisal, cocoa and (in 1984-5) mangoes. Local commerce is mostly controlled by businessmen of Levantine origin and by mulatto families.

The disturbances which began in November 1985 have led to something of an economic crisis. About forty US firms have withdrawn from Haiti leading to a loss of 12,000 jobs. This is partly due to political uncertainty, as well as to the possibility of demands for higher wages which might result from the creation of free trade unions; also new US restrictions on the importing of textiles have contributed. Again US health regulations have led to a decline in the importing of Haitian mangoes. Tourism, which might have begun to recover in 1986 from the AIDS scare has declined even further, with many hotels totally desolate.

Since the fall of Duvalier many exiles have returned home to set up political movements, including former Duvalierists Marc Bazin and Leslie Manigat—both favoured by the US—and René Theodore, who leads the Haitian Communist Party and appears to be receiving money from the French Communist Party. Political leaders who remained in the country include Sylvio Claude and Gregoire Eugène, with their rival Christian Democratic parties and Hubert de Ronceray, a former Cabinet minister under Duvalier. Serge Gilles, formerly living in Paris, heads a party with links to the Socialist International. Two trade union groups have been formed, one associated with the International Federation of Free Trade Unions (and thus with the American AFL/CIO), the other is politically more left-wing.

The junta headed by General Henri Namphy has generally restricted itself to maintaining some degree of order rather than embarking on major political changes. Namphy himself is widely believed to be an honest man without political ambitions, who wishes to allow a maximum of freedom for different voices to be heard. Pushed by public opinion, manifested in public demonstrations and strikes, the junta

¹⁴ T K Morrison, 'Case study of a 'least developed country' successfully exporting manufactures: Haiti', *Interamerican Economic Affairs* 29(1) 1975, pp 21f; J Grunwald *et al.*, 'Off-shore assembly in Haiti', in Foster and Valdman (eds) *Haiti, op. cit.*, pp 231f.

have rid themselves of former Duvalierists and have brought to trial a few *macoutes*. In a symbolic renunciation of Duvalierism, they changed the Haitian flag back to the blue and red of pre-1964 days. Yet it is generally believed that the strong man of the junta is Colonel Williams Régala, who heads the Ministry of the Interior. He and the Finance Minister, Lesly Delatour, have been widely denounced as politically conservative and as agents of the US. Their dismissal has been demanded by radical groups. The junta has set out a timetable for the formulation of a new Constitution and for the eventual election of a new President in November 1987. Perhaps one of the most important political requirements is the strengthening of local community action groups and the creation of a strong system of local and regional government.

The churches are divided. The returned exile priests have called for the resignation of Archbishop Ligondé owing to his past associations with Duvalier. Bishop Romulus of Jérémie appears to be the only member of the hierarchy with radical political views. The others, led by Bishop Gayot of Cap Haïtien, think more in terms of the old Christian Democrat theories of post-1945 Europe. Most Protestant groups, particularly those with strong ties to the US, spend much of their time warning their congregation of the dangers of 'atheistic communism'.

At this stage, it is impossible to say which way things will go in Haiti. While the junta has been criticised for not having embarked on ambitious reforms, it is fairly certain that any attempt to do so would be denounced by opponents on the grounds that the group has no 'mandate' for adopting substantive policies. If it manages to maintain a degree of social order within which constitutional and political debates are able to take place, and local institutions are able to develop it will have served a good purpose.

The end of American foreign policy

With its April 1986 bombing of Libya, the Reagan Administration seems determined to multiply its misfortunes. Failing to understand the root causes of terrorism against the US, it desperately seeks solutions through the implements of violence. Animated by the desolate intuitions of an endless Cold War, America now opposes its interests and its ideals at the same time. Unless there is a prompt reversal of current foreign policy in Washington, the United States faces widening circles of terrorism and, ultimately, extinction.

What kind of reversal is needed? To answer this question, consider the errors of recent actions and decisions:

In the Middle East the United States has meddled in the internal affairs of Iran, Lebanon and Libya, a series of ill-considered intrusions that threatens to make America an enemy of all of Islam, and even of millions of irate Europeans.

In Central America and Southern Africa the US has sustained corrupt oligarchies and repressive regimes while fostering lawless interventions (the Reagan Doctrine) against pro-Soviet states.

In Europe, ignoring the opportunities for arms control, the US has proceeded with deployment of 572 Cruise and Pershing II missiles in five NATO countries, a deployment that degrades nuclear deterrence while it generates renewed spasms of anti-Americanism.

Even in Haiti and the Philippines, where President Reagan takes credit for supporting the forces of 'democratic revolution', it is apparent that the eleventh-hour shift in loyalties was mandated by the collapse of long-standing US policies. The true crimes of Duvalier and Marcos, according to Washington, were not ones of despotism, but of *weakness*. Should these dictators have been able to remain in full control, they would still be counted by the Reagan Administration as bastions of the 'Free World'. And efforts to topple them from power would now be characterised in Washington as 'terrorism'.

Where has the US gone wrong? The answer has several components. It has confused violence with power. It has substituted rhetoric for thought. And above all else, it has subordinated every principle and goal to the sterile dualism of US-Soviet rivalry.

America's enemy is the Soviet Union. The Soviet Union is *always* the enemy. This is an Orwellian axiom of US foreign policy behaviour. It remains beyond question. To subject it to scrutiny is inexcusable. It is blasphemy.

America's enemy in world politics must always be concrete. It cannot be vague and shifting, so ephemeral that there is no passionate focal point of hostility. Indeed, this enemy must be opposed passionately, since it is on the plane of passion that anti-Sovietism draws its very meaning.

It is also on the plane of passion that the US may renounce any expectation from the Soviet Union of a course of conduct that is reasonable and self-interested. Everything is made clear and straightforward if one discerns in the Kremlin a metaphysical principle that drives it to do evil under all circumstances. The Soviet Union, we are told, is obliged to do evil, not good; it cannot be reformed. Not surprisingly, therefore, the US placed blame for its recent air raid against Libya on the USSR. If only the Soviet Union had warned American officials about plans for a terrorist attack on the West Berlin discothèque, said President Reagan, there would have been no reason for the US raid.

With this view, American policy reveals its own insubstantiality. Allegedly the only pragmatic approach to world affairs, it is in fact unremittingly utopian. If the Soviet Union is assimilable to the spirit of evil, no reconciliation or compromise is possible. Its will is one which commits itself purely, gratuitously, to do harm. Thus, all global misfortune—crises, wars, famines, revolutions—take place because of Soviet interference.

The American supporter of this view is fearful of discovering that the world is ill-contrived, that there exist many causes of its problems, for then he would be compelled to understand a complicated reality. Rather than be burdened with an agonising responsibility, he localises every hazard in the Soviet Union. Left unimpeded, however, such Manichaeism will have a self-fulfilling effect, creating the conditions under which one or the other superpower (or both) must be annihilated.

At its heart, the problem is one of individuals. US leaders can exploit an anti-Soviet world-view only because it satisfies the particular cravings of people. This world-view brings special pleasures. By treating the Soviet Union as a pernicious society, Americans affirm at the same time that *they* belong to an elite, one that is based on goodness. There

are no special requirements for membership in this elite, no standards of excellence that need to be met, only citizenship in the US.

We begin to understand the human roots of current US policy. The individual American supports a protracted enmity with the Soviet Union largely out of fear of being alone. To this end, he finds the existence of the Soviet adversary absolutely necessary. Small matter that the Soviet Union is essentially a state like his own, comprised of people like himself. Since he has chosen to devalue reason at the outset, he is impervious to logic, responding only to the strong emotional benefits of the herd.

The American who embraces current policy may readily confess that his Soviet counterpart shares a basic humanity. But this concession costs him nothing, for he has put this quality in parentheses. What matters is that a condition of sustained international enmity overcomes solitariness and mediocrity, that it ennobles membership in the crowd.

It follows from all this that before the US can extricate itself from the predatory embrace of *Realpolitik*, individual Americans will need to discover alternative and more authentic sources of reassurance. To a certain extent this process is already under way, animated by the manifestly contrived dualism offered by our leaders. Yet, the benefits of this process will accrue only to those people who display a measure of political awareness; they will be lost upon many millions of others who are unmoved by reason.

What is to be done about *these* people, those from whom the *Angst* of our time is only the newest form of hubris? Although their politics is a lie, confirming a total disjunction between problem and solution, it is a politics that confers far-reaching ego satisfaction and self-esteem. Where are there appropriate substitute forms of such satisfaction?

To answer these questions we must first understand that the journey from the herd to personhood begins by myth and ends in doubt. For this journey to succeed, the individual travelling along the route must learn to substitute a system of uncertainties for what he has always believed; to learn to tolerate and encourage doubt as a replacement for the comforting woes of statism. Induced to live against the grain of our civilisation, he may become not only conscious of his singularity, but satisfied with it. Organically separated from civilisation, he becomes aware of the forces that undermine it, forces that offer him a last remaining chance for both meaning and survival.

We may turn to Kierkegaard for guidance. Recognising the 'crowd' as 'untruth', he warns of the dangers that lurk in submission to multitudes:

A crowd in its very concept is the untruth, by reason of the fact that it renders the individual completely inpenitent and irresponsible, or at least weakens his sense of responsibility by reducing it to a fraction . . . For 'crowd' is an abstraction and has no hands; but each individual has ordinarily two hands . . .

And what is the most degrading crowd of all? The answer is supplied not by Kierkegaard, but by Nietzsche:

State is the name of the coldest of all cold monsters . . . The state tells lies in all the tongues of good and evil; and whatever it says it lies—and whatever it has it has stolen. Everything about it is false . . . All-too-many are born: for the superfluous the state was invented.

The task, then, is for each American to *become* an individual. Rejecting the idolatry of militaristic nationalism, each man and woman must understand the lethal encroachments of the state. Recognising in their current leadership an incapacity to surmount collective misfortune (Nietzsche reminds us that: 'Often mud sits on the throne—and often also the throne on Mud'), each citizen must strive to produce his own private expression of progress. 'From becoming an individual no one', say Kierkegaard, 'is excluded, except he who excludes himself by becoming a crowd.'¹

Worn threadbare, anti-Sovietism must cease to be the principal source of America's national meaning. Its replacement, however, must be authentic. To close what Pierre Teilhard de Chardin calls 'the spherical thinking circuit', the American prisoner of *Realpolitik* must learn to discover personal value in his own accomplishments, in his own private characteristics and contributions. Whatever bestows value and self-esteem, so long as it is not hurtful to others or beholden to nationality, advances the conditions of reason and an improved world order.

But such transformations cannot take place in a vacuum. Rather, they must be shaped by a 'sympathetic' society, a network of values and orientations that would encourage and nurture personal growth. At the moment, such a network does not exist. Imprisoned by a materialism

¹ Kierkegaard's and Nietzsche's views on self-affirmation have points in common with Paul Tillich and the existential psychotherapist Rollo May. Tillich speaks of this quality as the 'courage to be'. Without this courage, a person loses 'being'. Commenting upon the essential characteristics that constitute a person, May refers to the importance of 'preserving one's centredness.' In both sets of views, the emphasis is on creating and preserving identity, but not at the expense of fruitful participation with other beings. The goal is always to actualise human potentialities in harmony with others. See, for example, Paul Tillich, *The Courage to Be*, New Haven: Yale University Press, 1952, and Rollo May, 'Existential bases of psychotherapy', in May (ed), *Existential Psychology*, New York: Random House, 1961.

that overrides all other goals, Americans now stand in the ruins of consciousness. Melding back into the pre-formed mainstream of popular culture, they are wary of stepping out of line, careful to cultivate the trappings (but rarely the substance) of 'success'.

There is nothing new about such an indictment of American life. What is new—and what is deplorable—is that societal indifference to real personal growth has now become celebrated. Content to be casualties of a many-stranded system of manipulation, we Americans have learned to *despise* individualism.

None of this is to suggest that US foreign policy is 'caused' by behavioural and social deficiencies, but only that such deficiencies are exploited for political effect. Were the world organised differently, in a fashion without multiple sovereignties and zero-sum perceptions, individual American needs would seek different sources of satisfaction. But we *do* live in a fragmented world of separate states and in this world anti-Sovietism is made dominant by an ideology that 'feeds' upon the weakness of individual persons. There is nothing about the present structure of international relations that makes obsessive anti-Sovietism inevitable; it comes about only because this structure combines with behavioural conditions in a way that transforms them both.

Those who prescribe business as usual in American foreign policy are contemporary occupants of Plato's cave. Deprived of an illuminating vision of reality, they are destined to live in a world of illusion, animated by distortions that can never impel purposeful behaviour. No matter how vigorously they may cling to their tenets of 'realism', their truth is, as Plato suggests, 'literally nothing but the shadows of images'.

But what, exactly, must be done to change all this? What must be done to bring about the desired changes in US foreign policy? How can the US re-route its narrowly self-interested mode of foreign policy activity to a more promising orientation? How can its leaders build upon the understanding that it is in America's own best interests to develop strategies of international interaction from a systematic vantage point?

Is it already too late? There are, of course, the fatalists. Their answer is simple: '*Après nous, le déluge*'. Let us not think about the President, his Cold Warriors and his strategic mythmakers. It would only disturb our sleep.' Others, however, are not yet prepared to surrender. Refusing to capitulate to unreason, they are prepared to support a new foreign policy. Underlying this policy is the awareness that the US coexists with all other states in a perilously fragile network of relationships.

To begin, a new paradigm of American statecraft is needed. Before US foreign policy behaviour can create a more auspicious domestic and global pattern of interaction, there must take place a revolution of consciousness. This new paradigm that we seek depends largely on a process of non-incremental or revolutionary change in thought. Although it is certainly true that all science progresses on the basis of accretion, specifically by the incremental accumulation of 'failed' hypotheses, it is also true that such a basis has never been sufficient. The major episodes within science wherein an overarching approach to a discipline has been replaced by another—e.g., the advent of Copernicanism and the thought of Einstein—have been *revolutionary* episodes. In a similar fashion, the steps that give rise to a new political dynamic must be founded upon a wholly new understanding of international relations.

Nuclear war

The nuclear arms race cannot last forever. In a world already shaped by some 6,000 years of organised warfare, it is hard to imagine that nuclear weapons will remain dormant. Rather, the apocalyptic possibilities that now lie latent in these weapons are almost certain to be exploited, either by design or by accident, by misinformation or by miscalculation, by lapse from rational decision or by unauthorised decision.

Since the dawn of the Atomic Age, the search for security through destructive weaponry has led only to increased insecurity. Although the world's stockpile of nuclear weapons now represents an explosive force more than 500 times greater than all the munitions used in World War II, the expansion of superpower arsenals continues at a frantic pace. And in the United States this expansion is now undertaken from a policy perspective that ties successful deterrence to a capacity to 'fight' a nuclear war that might be 'protracted'.

The situation is driven by the ever-hardening dualism of US-USSR relations and by the associated American tendency to cast all such relations in zero-sum terms. Although the period from the Cuban missile crisis (1962) to the present was marked by a conscious commitment to avoid direct confrontations with the Soviet Union, there now seems to have developed an increased US willingness to accept such confrontations as an essential requirement of rational competition in a decentralised world system. Moreover, wars have been increasing

n frequency since 1945, a development that contributes to the likelihood of a direct conflict between the superpowers.

Current US nuclear strategy is the antithesis of genuine thought. Assuming that because nuclear deterrence has worked so far it will work or ever, this strategy avoids any productive attempts at long-term security. In this respect it is reminiscent of the position of the chain smoker who contends that he has been smoking cigarettes for twenty-five years without ill effects and that smoking must therefore be safe. The real question, of course, is whether smoking will *ultimately* kill him. If it does, the final assessment of costs and benefits will turn out to be dramatically less optimistic.

Another overwhelming deficiency of current US nuclear strategy lies in its curious commitment to 'balance' in US-USSR nuclear forces. As long as one can convince a rational Soviet adversary of an ability and willingness to destroy the USSR after suffering a first strike, it will—whatever the existing balance of forces—be deterred. It is also true that a vastly larger US nuclear arsenal could *undermine* deterrence. Indeed, this is precisely the problem today, since the newest US missiles are manifestly unsuitable for anything but an initial move of war.

It is wrong to assume that neither side will ever strike first if it believes that by doing so it will bring down overwhelming carnage upon itself. Even perfectly rational states can be expected to pre-empt, whatever the expected consequences, if they believe that the other side is about to strike first. This is the case because in the theatre of the absurd logic of nuclear strategy, the country that strikes first in such a situation may expect to suffer less than if it waits to strike second. Sadly, almost everything now being done by the United States contributes to the Soviet fear of an American first strike.

The government of the United States has yet to admit to its citizens that they are utterly defenceless against the effects of nuclear weapons. Reliable ballistic missile defence has never existed, nor will it ever exist. Ironically, the attempts to institute strategic defence initiatives will be extraordinarily provocative, since they will encourage the Soviet Union to accelerate its own offensive missile capabilities and to pre-empt in the near term. The US, for its part, lulled into complacency by the delusion of defence, might abandon remaining plans for arms control or even fulfil Soviet fears by preparing for an American first strike.

The Reagan Administration has denied us the truth about its plans to enlarge the American inventory of destabilising nuclear weapons. During the next decade, the US will build about 17,000 new nuclear

weapons. Spending on these weapons is going up much faster than overall military spending. Under present plans, the US will spend \$450 billion over the next six years preparing for nuclear war. And these monies will be used to create threatening counterforce systems that will engender a corresponding Soviet buildup and undermine nuclear deterrence.

But the Reagan Administration is not really worried. After all, it regards as *inconceivable* the idea that the United States would ever cease to exist. With this view—a delusion of collective immortality—the administration continues its flirtations with the Apocalypse.

Nuclear strategy is a game that sane leaders may play, but not with frivolity. The fact that it has chosen the theological imagery of good versus evil in describing US-Soviet relations does not free the Reagan Administration from the threat of annihilation. Indeed, such imagery tends to displace the last vestiges of prudence, making it more and more likely that the US, like a face drawn in sand at the edge of the sea, will be erased.

Such imagery also masks an underlying and overwhelming egoism that may make the survival impossible. E M Cioran, whose unique voice speaks in the tradition of Kierkegaard and Nietzsche, has said: 'Nature has been generous to none but those she has dispensed from thinking about death.' In this he is only partly correct. Although it is true, as Freud once noted, that it is impossible to imagine our own death, it is an effort that must be tried. By insulating itself from reasonable fears of an all-destructive nuclear war, the US makes such a war likely.

Supere aude! ('Dare to know!') This motto for the eighteenth-century period of the Enlightenment suggested that the philosopher Kant acquires a special meaning in the late twentieth-century study of nuclear war. Just as repression of the fear of death by individuals can occasion activities that impair the forces of self-preservation, so can the US impair its prospects for survival by denying the possibility of collective disintegration. If it is to serve any useful purpose, the fear generated by our straightforward look at the consequences of nuclear war must lead us away from that bloodless brand of 'realism' that is so characteristic of theological anti-Sovietism. Instead of rarefied 'think-tank analyses that reek of the very unreality they seek to dispel, we must begin to prevent nuclear war by highlighting its concrete human costs. Such euphemistic notions as 'limited nuclear war', 'collateral damage', 'countervalue' and 'counterforce' strategies and 'enhanced radiation warfare' are

dangerous to the cause of peace because they contribute to the myth that nuclear warfighting might be rational.

Perhaps the closest we can come to really understanding what it may be like to endure a nuclear conflict is by studying the anatomy of life in the death camps of Nazi Germany and the aftermath of atomic war in Japan. Although the analogies are certainly imperfect, there are no other darkly visionary sources of human experience to which we can so safely turn. The total immersion in death; the olfactory stimulation provided by tens of thousands of burning bodies; the overwhelming imagery of unending terror and loss that were the central features of these two atrocities, offer us the clearest *human* picture of life in a post-apocalypse world.

At the time of their descent into hell, the survivors of Auschwitz and Hiroshima, of Treblinka and Nagasaki, reacted to the other-worldly grotesqueness of their conditions with what Yale psychiatrist Robert J. Lifton describes as a profound sense of 'death in life'. Witnessing, in the one case, the thrusting of newly delivered babies, *alive*, into ovens, and in the other, the appearance of long lines of severely burned, literally melting, ghosts, the survivors found themselves—in Bruno Bettelheim's words, an 'anonymous mass', or in the Japanese term, *muga-muchu*, 'without self, without a centre'. Such a total disruption of individual and social order, of one's customary personal and community supports, produced consequences that went far beyond immediate physical and emotional suffering. Indeed, this understanding is incorporated in the Japanese term for atomic bomb survivors, *Hibakusha*, which delimits four categories of victims, including those who were *in utero* at the time of the blast.

Of course, in the case of nuclear war, the symbols and images that are needed to interpret the idea of total extinction simply do not exist. The absence of such symbols and images makes it impossible for us, in thinking about such a war, to follow Martin Buber's injunction to 'imagine the real'. Nevertheless, even if a global necropolis is not psychologically absorbable at the moment, imaginings of such a world must be encouraged.

In the unsentimental theatre of modern world politics, the time is at hand for a new kind of dramaturgy, a 'new naturalism' that touches profoundly the deepest rhythms of human imagination. Our playgoing sensibilities must no longer be confined to the implausible pap of 'balance of terror', 'nuclear utilisation theory', and 'peace through strength'. We require honest passages of down-to-earth exposition,

even if the necessary tracts and tirades become endless and unbearable.

A few years after the American Declaration of Independence, the Continental Congress adopted as a motto on the Great Seal of the US the phrase of Virgil's, *Novus ordo Seclorum* ('a new age beginning'). In a world imperilled by nuclear war, it is time for this motto to be applied to American foreign policy. In a world where the convulsive changes in our era signal the possibility of 'gigadeath', or death in the billions, it is time to substitute the dignity of cooperative international interaction for the folly of perpetual anti-Sovietism. By its actions to make such substitution possible, the United States would carry within itself the potential to confront the *ancien regime* of Cold War competition not as a victim, but as a gifted elegist.

Human rights

In making anti-Sovietism the centrepiece of its policy on human rights the United States has accepted an orientation to global affairs that is inherently self-defeating. During the next few years, the victims of US-supported repression throughout the world will begin to overthrow their oppressors, creating successor governments with unquestionably anti-American leanings. In the fashion of Vietnam, Cuba, Nicaragua and Iran, these governments will join the ever-expanding legion of states opposed to the US. Sadly, this development will have been avoidable if only America had remained true to its doctrinal foundations.

Although it is now perfectly clear that the Vietnam War might have been avoided if the US had only understood the forces of revolutionary nationalism in the Third World, there is still no attempt to understand these forces. While it is now quite likely that early support for a still pro-American Ho Chi Minh rather than for his colonial masters might have created an ally instead of an adversary, the US continues to advance its visceral counter-revolutionary ethos. What can America hope to accomplish by standing alongside such pariah states as Chile and South Africa while unleashing forces to 'destabilise' far less repressive regimes?

During his 1986 State of the Union Address, President Reagan confined his humanitarian concerns to Nicaragua, Afghanistan, Angola and Kampuchea. No mention was made of Haiti, which even in the darkest days of the Duvalier regimes was treated in Washington as par

of the 'Free World'. Within the coming year, the interim government in Haiti will have to contend with several competing claimants for power, possibly including forces supported by Cuba, Nicaragua and the Soviet Union. And these forces could become the enduring successor government replacing Duvalier, a government with decidedly anti-American leanings.

Why should this be expected? Once the euphoria has died down in Haiti, many will remember the US role in sustaining the Duvalier dynasty because it was an 'authoritarian' rather than 'totalitarian' regime. The result will be a favourable climate for ascent to power by anti-American elements, an ascent that the extant Marxist regimes in this hemisphere will be only too happy to help along. As time passes, the new government in Haiti will be likely to get involved in the same forms of regional insurgency currently aided by Cuba and Nicaragua. Identified as yet another source of 'terrorism' by the US, this government may then become the object of attack by the next American-supported cadre of 'freedom fighters', a new generation of 'contras' who will further tarnish the image and the security hopes of the US.

In Haiti the mistake was made long ago. By identifying American national interests with the rule of a hated dictator, the US ensured the erosion of its interests and its ideals. Although Reagan provided the transportation that ultimately removed Duvalier, few will forget that America acted only at the last moment, and only when it became apparent that the *tontons macoutes* were no longer effective. Few will fail to understand that the US would have stood firmly behind the crimes of the *Volontaires de la Sécurité Nationale* (VSN) if only they had been able to stay in control.

There has been no learning from the lessons of the past. The US now fully intends to repeat the persistent failures of earlier policies. Describing its programme as 'silent diplomacy', the Reagan Administration undermines any remaining hopes for a safe and decent world order.

Indeed, in one of the dominant ironies of the current situation, the presumed US imperative to ignore human rights in 'authoritarian' states as a requirement of national security enlarges the chances of nuclear war. By its policy to align itself with right-wing juntas and other reactionary regimes, the US heightens the prospects for confrontation with the Soviet Union, either directly or by escalating involvement with surrogate forces. In Central America, for example, US actions portend a transnational civil war, with authoritarian regimes and counter-

revolutionary guerrillas backed by the US fighting against leftist insurgents and revolutionary regimes backed by the Soviet Union.

Human rights, of course, are also important *in themselves*. In this connection, the Reagan Administration has fostered the image of America as a pestilence. Vitalised by a flawed understanding of *Realpolitik*, the president has reduced entire populations of human beings to feeble specks surrounded by unfathomable depths of silence. This is the true meaning of 'silent diplomacy'.

Significantly, the Reagan Administration's position has created a kaleidoscope of shame that mocks America's historic commitment to 'inalienable rights'. Deluded by superficial intuitions of power and influence, the architects of this position have turned aside a nation's high ideals with cynical flourish. As a result, these ideals have assumed the character of vaporous fairy tales, suitable for transmittal to school children but not for the design of foreign policy.

Just as significantly, the current US Administration position on human rights represents a far-reaching rejection of modern international law. Although it is under no binding obligation to display humanitarian sensitivity toward other states, the US is bound by the codified and peremptory norms of the Law of Nations—rules that endow all human beings with a basic measure of dignity and support. By its derogation from these norms, the Reagan Administration transforms America into an habitual 'outlaw'.

In the aftermath of the Holocaust, the philosopher Karl Jaspers addressed himself to the question of German guilt. His response to this question articulates one of the most fertile and important concepts of modern thought, the idea of 'metaphysical guilt'. In this connection, wrote Jaspers: 'There exists a solidarity among men as human beings that makes each co-responsible for every wrong and every injustice in the world, especially for crimes committed in his presence or with his knowledge. If I fail to do whatever I can to prevent them, I too am guilty.' Understood in terms of President Reagan's current unconcern for ongoing crimes against humanity, Jaspers' doctrine suggests an urgent need to confront overriding Nuremberg obligations.

From the point of view of the US, the Nuremberg obligations are, in a sense, doubly binding. This is the case because these obligations represent not only current normative obligations of international law, but also the doctrinal obligations engendered by the American political tradition. By their codification of the principle that fundamental human rights are not an internal question for each state, but an imperious

postulate of the international community, the Nuremberg obligations represent a point of perfect convergence between the Law of Nations and the jurisprudential/ethical foundations of the American Republic.

Nuremberg established, beyond any reasonable doubt, the continuing validity of natural law argumentations. While the indictments of the Nuremberg Tribunal were cast in terms of positive international law, the actual decisions of the Tribunal unambiguously reject the proposition that the validity of law depends upon its 'positiveness'. The words used by the Tribunal ('So far from it being unjust to punish him, it would be unjust if his wrongs were allowed to go unpunished') derive from the principle *nullum crimen sine poena* ('no crime without a punishment'). This principle, of course, is a flat contradiction of the underlying idea of positive jurisprudence, the idea of law as exclusively the command of a sovereign.

As an answer to the question, *quid ius?*—'what is law'—international law now rejects all empirical solutions that substitute force for justice. Rather than accept the neo-Kantian distinction between the 'concept' and the 'ideal' of law, international law now recognises that the concept and the ideal coincide. The Law of Nations, like all law, is therefore a branch of ethics. Taken together with the understanding that the supremacy of natural law has always been part of the American tradition, and that the current position of international law is essentially an 'incorporation' of this tradition, this conclusion suggests an overriding imperative for change in the direction of American foreign policy on human rights.

The birth of an improved American foreign policy on human rights will have to be fashioned incrementally. How can this happen? Clearly, the ethical, traditional, and legal imperatives already discussed are an insufficient basis for transforming American foreign policy. To expect these imperatives to have an independent effect would be to commit the worst fallacies of utopianism.

Before the US can turn from its current direction on human rights, its leaders will have to calculate that such a turn would be in its own political interests. The task, then, is to discover areas of convergence between the aforementioned imperatives and perceived strategies of national self-interest. The US will turn to a lawful policy on human rights only when it understands that by supporting the punishment of crimes against humanity it protects not only the interests of the international community, but its own interests as well.

What can foster such understanding?

To begin, a growing number of people throughout the world are already reeling, beleaguered and distraught by the inhumane values of US foreign policy. Americans in particular are becoming increasingly concerned that they must accept complicity in the retrograde actions of their government, and that they may therefore lose any claims to bear witness as a righteous people.

'A nihilist,' Camus tells us in *The Rebel*, 'is not one who believes in nothing, but one who does not believe in what exists.' Disinterested in nuance, in complexities that sully simple explanations, the Administration in Washington calls us back to an easier epoch when 'we' were good, 'they' were bad, and nothing else mattered. Ignoring the summons of reason, it continues to wallow *outside* the world, dissolving thought in the drive of clarity.

America can do better. By recognising itself as both a moral and a mortal nation, it can oppose the illusion of benefit from a frenzied and perpetual anti-Sovietism with the true and effectual vision of goodness. The result will be worth the effort. Instead of a pretext for convulsions, a reason for hysterical imprecations against an 'Evil Empire', American foreign policy can become the instrument of a peaceful and just world order. And while such policy may fall short of a New Jerusalem, it may still constitute a visible hyphen between heaven and earth.

Terrorism

In the aftermath of repeated attacks on Americans, US officials search anxiously for effective antidotes to terrorism. They will never find such antidotes in tactical or military measures. This is because the origins of most anti-US terrorism lie in specific elements of American foreign policy. And these elements, in turn, are the product of an underlying and all-consuming anti-Sovietism.

To reduce the risk of terrorism against the US, one must first understand the relationship between despotism and insurgency. Regime terror breeds insurgent terror. America cannot consistently support the former for geopolitical advantage without expecting the latter.

This brings us back to human rights. Nurtured by the sterile clairvoyance of the Cold War, the Reagan Administration will tolerate virtually any breach of human rights in anti-Soviet regimes. As a result, certain of the oppressed peoples of Latin America and South Africa are now irrepressibly hostile to the US. Recognising the alliance

between their oppressors and US policy, they will increasingly target Americans as well as local oligarchs.

There has been no learning from lessons of the past. If the US is really interested in protecting itself against terrorism, why does it persist in support of governments that make terrorism inevitable? If it fears that Chile will become 'another Nicaragua', why did it install the Pinochet regime in the first place? If it fears that Nicaragua will become 'another Cuba', why does it cling foolishly to interventionist policies that leave the Sandinistas no other choice? If it fears expanding Cuban involvement in Nicaragua, why does it support a 'contra' insurgency that increases such involvement? And if it fears that Angola will provide a launching-point for Cuban 'subversion' in sub-Saharan Africa, why does it support a South African-directed insurgency that can only expand Cuba's role in the region?

What will happen when the opponents of US-supported repression in Latin America and South Africa mount successful insurgencies, creating successor governments with strongly anti-American leanings? The answer is entirely predictable. The US will begin the next phase of its self-defeating geopolitical competition, mounting its own insurgencies to topple regimes that are now 'left-wing'. Resembling the Reagan Administration's current illegal wars against Nicaragua and Angola, these insurgencies—conducted by 'freedom fighters'—will seek to bring down a black majority government in South Africa that will be denounced as a 'Soviet pawn'. By this reasoning, the present condition of apartheid will be described as the 'lesser evil'.

Before the US can reduce the risk of terrorism its leaders must understand the difference between lawful and unlawful insurgencies. And this understanding must be based upon more than the intuitions of geopolitics. Specifically, it must rest upon well-established jurisprudential standards that reflect not only international law but also the most cherished elements of the American political tradition.

The imperative is clear! To meet the requirements of effective counter-terrorism, the US must oppose repressive regimes and movements whatever their ideological stripe. It must also support those insurgencies that spring from genuinely 'just cause' and that are carried out with due regard for humanitarian rules governing the use of force.

Today, the Reagan Administration embraces only one standard of judgment concerning insurgency: anti-Sovietism. Human rights have nothing to do with this standard. It follows that efforts to overthrow allegedly pro-Soviet regimes are always conducted by 'freedom fighters'

(even where these efforts—as in the case of the ‘contras’—involve rape, pillage, and mass murder) while efforts to oppose anti-Soviet regimes (even where these efforts are undertaken by the most oppressed and downtrodden peoples) are always conducted by ‘terrorists’.

Consider President Reagan’s press conference of 21 March 1985, where he stated that the seventeen blacks recently shot by South African police were not ‘simply killed’, but were the excusable casualties of ‘rioting.’ Moments later, reacting to a question about Nicaragua, the president defended the use of force against a ‘Communist tyranny’. In other words, rebellion against apartheid must always be peaceful, but opposition to Sandinista rule must always be violent.

With this view, black South Africans, although understandably unhappy to be victims of a uniquely repressive regime, are instructed to be ‘patient’ as the US continues with its policy of ‘constructive engagement’. At the same time ‘contra’ rebels—widely and authoritatively associated with the execution of non-combatants in Nicaragua and with death-squad activities in El Salvador and Honduras—are embraced by the president as ‘our brothers’. These ‘freedom fighters,’ said the president on 1 March, ‘are the moral equal of our Founding Fathers.’

By its failure to recognise the connection between regime terror and insurgent terror, the US will render itself increasingly vulnerable to terrorism. This increasing vulnerability is due not only to the Reagan Administration’s tolerance of repression in ‘authoritarian’ regimes. It is also due to its active opposition to certain ‘totalitarian’ governments. In Nicaragua, for example, it is obvious that the ‘contras’—even with significant levels of US aid—will be defeated. An expected consequence of this defeat—in addition to hardened anti-American resolve by the Sandinista regime—may well be terrorism directed against the US and/or its interests and personnel abroad. The origins of this terrorism might lie not only with the Sandinistas, who will have been pushed into the arms of the Soviet Union by self-defeating US policies, but also with the remnants of an embittered ‘contra’ force.

Recently, Secretary of State George Shultz, in an address on ‘Terrorism and the Modern World’, said the following: ‘I can assure you that in this Administration, our actions will be governed by the rule of law; and the rule of law is congenial to action against terrorists . . .’² In

² See George Shultz, ‘Terrorism and the modern world’, US Department of State, Bureau of Public Affairs, 25 October 1984, *Current Policy* No. 629, p 1.

fact, of course, the Reagan Administration has been guided not by law but by the banal syntax of power politics. Although the rule of law is indeed congenial to action against terrorists, it does not permit the subordination of settled jurisprudential standards to the presumed requirements of Cold War competition.

The US cannot change the rules of world politics at will. There is little point to America's condemnations of state-supported terrorism against US interests in the Middle East if it continues its own lawless forms of intervention there and elsewhere in the world. There is also little point in America's bemoaning terrorist indifference to the humanitarian rules of armed conflict when 'contra' and UNITA rebels display total disregard for these rules.

Recent attempts to counter terrorism by the Reagan Administration reveal the importance of consistency in observing international law. Refusing to submit to the compulsory jurisdiction of the World Court (International Court of Justice) in the case brought by Nicaragua, the US Administration can hardly lay claim to lawfulness. In this connection, US credibility as a rule-abiding member of the community of nations is further undermined by President Reagan's direct violation of the World Court's interim judgment of 10 May 1984, a judgment requiring the US to refrain from any continued support of the contras.

By opposing the World Court on Nicaragua, the Reagan Administration does more than violate international law. It violates its own national interests. Recognising that they can do nothing to inhibit American military and paramilitary intervention against their government, the Sandinistas are apt to conclude that they will have to 'fight fire with fire'. And this fight is likely to be waged, in part, along the same lines as the 'contra' war against Nicaragua.

The Declaration of Independence sets limits on the authority of every government. Since justice, according to the American Founding Fathers, must bind all human society, the rights articulated by the Declaration cannot be reserved only to Americans. To deny these rights to others on narrow political grounds is illogical and self-contradictory, since it undermines the permanent and universal law of nature from which the Declaration derives.

The US has not always been opposed to its own best traditions. In its early years, George Washington noted: 'The foundation of our national policy must be laid in the pure and immutable principles of private morality.' Accepting the wisdom of the first President, Mr Reagan must change direction before it is too late. Although it is both correct and

pragmatic to oppose terrorism in every form, he must first acknowledge a lawful definition of terrorism.

When the sculptor Auguste Rodin began the most ambitious project of his career in 1880, a pair of doors deriving its theme from Dante's allegorical journey through hell, he determined to create a personal vision of the underworld far more complex than that of the *Inferno*. With this vision, Hell was to represent a condition rather than a place. Following this conceptual goal, the plaster composition developed to display an agonising humanity writhing against a changing background. The solitary tranquil form in the work is *The Thinker* who, from his high position in the lintel, broods on the swarm below as he reviews and re-imagines the fate of our species.

As suggested by Rodin, the background of the world, always in flux, is now highlighted by an unprecedented vastness of space, by infinite abysses that mock our insignificance. Viewed from the vantage point of the artist's *Thinker*, this condition compels an end to the egotism of *Realpolitik* imaginings and a beginning to less lethal patterns of consciousness. In these beginnings, the US must be shorn of its trappings of sacredness and all international interactions must be understood solely as more or less transient patterns of mundane limits. In abandoning the ruins of *Realpolitik* ideology, the US could begin to confront the ashes of endless ruins-in-the-making as a mentor to all who wish to survive.

With its current theology of anti-Sovietism, the US stands before the world as an impetuous fool, a blundering giant whose plans for success are merely designs for the end of the world. Nothing predestines America for failure; on the contrary, it is a nation with enormous opportunities for success. Yet it tends toward defeat, drawn steadily 'forward' by the seductive virulence of an anti-Soviet crusade. But there is still time for a change in direction. To accomplish this change, Americans must first learn to differentiate between the reasonableness of secular political competition and the hopelessness of theological conflict in world affairs.⁵

⁵ The US fears Islamic militants in the Middle East because they have chosen to fuse politics and theology. Yet, America is also captive of such a fusion. Is there really such a vast difference between Shiite crusaders seeking revenge against the 'Great Satan' and the President of the US preparing for an apocalyptic war with the 'Evil Empire'? Is it entirely extraneous to an all-consuming rivalry with the Soviet Union—a rivalry that creates policies that foster anti-US terrorism—that the adversary is typically lambasted as 'godless'? Spokesmen for Lebanon's *Hizbollah*, or 'Party of God', have said: 'We aren't against the American people. We are against oppression and injustice.' US leaders say they have nothing against the Soviet people. They merely oppose the 'focus of evil' in the modern world.

De-democratising American foreign policy: dismantling the post-Vietnam formula

Lying is not a new phenomenon in American history or politics, but there is, after all, a question of degree and frequency, and surely nothing in our past has matched, in scale and quality, the grand deception of Vietnam.

Government deception, supported by a pervasive system of official secrecy and an enormous public relations machine, has reaped a harvest of massive public distrust. This deep distrust of government, and the word of the government, has altered traditional political relationships in America. It has shattered the bond of confidence between the government and the people. And it has diminished our confidence in ourselves and in our ability as people to overcome the problems that confront us.¹

... there have been so many deceptions and lies about Nicaragua that Congress and the Press are beginning to rebel.²

George Orwell taught us that politicians corrupt words in order to sell corrupt policies. If Orwell were here now, how savagely he would be dissecting the latest example of Newspeak: the Reagan Administration's sales campaign for aid to the Nicaraguan 'contras'.³

The challenge to the post-Vietnam Watergate commitment

The Vietnam War and Watergate warned the American people about the dangers of an increasingly autonomous national security bureaucracy headed by an imperial President: these foreign policy elites circumvented the authority of Congress and the courts, viewed themselves above the law, particularly in foreign policy matters, and used secrecy and distortion to deceive Congress and the public in order to accomplish their policy objectives. The American public was

reminded of the importance of holding the President accountable and Congress was spurred to strengthen the system of checks and balances, passing, for example, the War Powers Act of 1973⁴ and creating Congressional Intelligence Oversight committees to monitor the CIA.⁵

A crucial element of the post Vietnam-Watergate formula that emerged was a recognition of the importance of accurate, honest information if citizens and their leaders were to make intelligent judgements and hold the executive accountable. Citizens could not be expected to give their consent to be governed if they were misled or lied to. If policy were made and carried on in secret there was no way that Congressional checks, public opinion, or elections could hold the Executive accountable. Distortion, lying and secrecy prevented the rational debate of a democratic citizenry that expected to participate in decisionmaking,⁶ and that wanted to know what it was for which they

⁴ The War Powers Resolution of 1973 aimed to restore a balance that had shifted from Congress (that was constitutionally given the power to 'declare war') to the President who had expanded his prerogatives as 'Commander-in-Chief'. Congress did recognise that in times of emergency (an attack on the United States, for example) there was little time for shared decisionmaking. But the most common Executive usurpations were not in cases of real emergencies. Congress thus insisted that a President could not continue military action beyond sixty days without Congressional approval. It further insisted on 'collective judgement' regarding the commitment of US forces into hostilities. And it legislated that the President 'shall' consult with Congress 'in every possible instance' and to submit a report to Congress within forty-eight hours after committing troops. There is an extensive literature on the War Powers Resolution. See, for example, Pat M Holt, *The War Powers Resolution: The Role of Congress in US Armed Intervention*, Washington DC: American Enterprise Institute, 1978. For a valuable assessment of this issue, also see Jerel A Rosati, 'Congressional influence in American foreign policy, addressing the controversy', *Journal of Political and Military Sociology*, 12, Fall 1984, especially pp 315-19.

The Hughes-Ryan Amendment in 1974, amended again in 1980, set up permanent intelligence oversight committees in each house (established in 1976 and 1977) and required that each covert operation be reported to the committees 'in a timely fashion' and include a 'description and scope' of the activity. The Case-Zablocki Act of 1972 required that all executive agreements be reported to Congress. In 1974 Congress required that arms sales had to be reported to Congress. But perhaps more important than the specific statutes was the general commitment Congress made to watch Presidential actions more carefully, and to use its existing powers as leverage to demand that foreign policy decisions be shared.

⁶ For a thoughtful assessment of this issue see, Kalman H Silvert, *Man's Power: A Biased Guide to Political Thought and Action*, New York: Viking Press, 1970, especially Chapter IV, 'The Human Purpose of Political Action'. Silvert lays out a cogent argument as to the pernicious effect of lying on a democratic polity.

Lying is the most nefarious political offense . . . Untruths, especially when robed in political . . . authority, destroy the possibility of creating common perceptions of political events . . . Not exempted from this indictment are lies connected with national security and defense . . . The politically despicable nature of public falsity is not saved even by a situation of absolute national emergency—for then, above all times, widespread social cohesion based on demonstrated faith in public institutions and the integrity of leadership [legitimacy] is a necessity.

No argument is intellectually more craven or potentially more damaging to the consensus

were being asked to sacrifice their lives and those of their loved ones and friends.

The disclosures of the Pentagon Papers publicly confirmed what many had been claiming for some time: that secrecy justified in the name of national security was not so much aimed at keeping 'the enemy' in the dark but, rather, at misleading the American public. There was also an increasing public awareness that the information they were receiving was false or distorted. By the late 1960s, the 'credibility gap' had so undermined public trust in government,⁷ that it actually became a political issue in the presidential campaigns. Indeed, when Nixon was elected in 1968 his newly appointed Communications Director proclaimed a commitment to telling the truth, this by an Administration that would bring lying and distortion to its zenith: 'I'm confident we will—truth will become the hallmark of the Nixon Administration . . . We feel that we will be able to eliminate any possibility of a credibility gap in this Administration.'⁸

The public revulsion at lying, distortion and the misuse of secrecy led to a commitment to lessen government control over information, an increase in investigative reporting and scrutiny of government statements by the media, and a widespread recognition of the dangers of such control and misuse of information. Further, the new Congressional commitment to an increased role in foreign policy-making and more presidential accountability led to important efforts to increase access to information about foreign policy for itself and for the public. Congress understood that there could be no accountability without access to information.

The new intelligence oversight committees were one way to get previously unavailable information without sacrificing the need for reasonable secrecy. The Freedom of Information Act was strengthened in 1974 to provide for judicial review of executive agencies' decisions to

system of democracies than that the bureaucrat's decision should be accepted in the absence of corroborative data whose revelation would damage the national security.

. . . A lie inevitably involves inefficiency and incompetence. . . a restriction of choices made possible by the social situations we find ourselves occupying at any given time. Lying is always figuratively suicidal, homicidal, and genocidal, and sometimes it is literally so. (pp 152–4)

⁷ Sissela Bok writes: 'In 1960, many Americans were genuinely astonished to learn that President Eisenhower had lied when asked about the U-2 incident, in which an American spy plane and pilot had been forced down in the Soviet Union. But only fifteen years later, battered by revelations about Vietnam and Watergate, 69 per cent of the respondents to a national poll agreed that "over the last ten years, this country's leaders have consistently lied to the people" . . . *Cambridge Survey Research*, 1975, 1976, cited in Sissela Bok, *Lying, Moral Choice in Public and Private Life*, New York: Pantheon Books, 1978, p xvm

⁸ Wise, *Politics of Lying*, op. cit., p 21

keep all parts of a document classified. The size of legislative staffs was increased to provide more information in all areas, including foreign affairs. The improved foreign policy expertise of staff members was to provide Congressmen with independent sources of information. Even the White House, under the Carter Administration, expressed a commitment to less secrecy when it promulgated a new Executive Order on classification in July 1978: it narrowed the minimal basis for creating official secrets, and insisted that the public's 'need to know' be balanced against the protection of information.⁹

'Politics as usual' was thus seen as increasingly dangerous to democracy during Vietnam and Watergate, and there was a commitment to doing something about it. But what has been the sticking power of this new commitment? Is there now the kind of honesty and access to information that is necessary to hold leaders accountable and prevent the abuse of power? This is one central question of this paper. The particular locus of concern is the first test case since Vietnam of an unpopular foreign policy that risks an unpopular war in which Americans might be involved: foreign policy toward Central America. The evidence suggests that far from openness, there is a suppression of information; instead of candour and open debate, the Reagan Administration has been involved in dishonesty and distortion that is at least as serious as the Johnson and Nixon Administrations. Indeed, the opening quotes from leading columnists are just the tip of a dangerous iceberg, whose hidden contours have already been documented in a number of books and articles.¹⁰

⁹ In the previous Executive Order (E.O. 11652, March 1972), the standard for classifying information was that disclosure 'could reasonably be expected to cause damage to the national security.' Under Carter's order it was that disclosure 'could reasonably be expected to cause *identifiable* damage to the national security.' Further, the Carter order said 'if there is reasonable doubt which designation is appropriate, or whether the information should be classified at all, the less restrictive designation should be classified.' Further, his order introduced an important balancing test: 'In some cases, however, the need to protect such information may be outweighed by the public interest in disclosure of the information, and in these cases the information should be declassified'; Richard C. Ehlike and Harold C. Relyea, 'The Reagan Administration Order on security classification: a critical assessment', *Federal Bar and News Journal* 30(2), February 1983, p. 93.

¹⁰ See, for example, *Ronald Reagan and the Reign of Error*; The Central America Crisis Monitoring Team, *In Contempt of Congress*, Washington DC: Institute for Policy Studies, 1985; Jim Leach, George Miller and Mark O. Hatfield, *US Aid to El Salvador: An Evaluation of the Past, A Proposal for the Future*, Arms Control and Foreign Policy Caucus, February 1985, pp. 1-7; Americas Watch, *Human Rights in Nicaragua, Reagan, Rhetoric and Reality*, New York: Americas Watch, July 1985; Americas Watch, *Guatemala Revised: How the Administration Finds 'Improvements' in Human Rights in Guatemala*, New York: Americas Watch, September 1985; Americas Watch, *The Continuing Terror, Seventh Supplement to the Report on Human Rights in El Salvador*, New York: Americas Watch, September 1985, pp. 129-36; Anthony Marro, 'When the government tells lies', *Columbia Journalism Review*, March-April 1985.

We will explore this return to secrecy, lying and distortion in the context of a second question: why did the changes after Vietnam not hold? There are several plausible explanations.

One is that we are simply seeing 'politics as usual'. Politicians naturally seek power, and power corrupts. To maintain their power they will try to hide unpopular actions, or shape public opinion with lies and distortions if necessary. Politicians are Hobbesian beings, naturally pursuing self-interest with little or no virtue to restrain them, and they will do what is needed to maximise influence and gain votes, just like the rational actor in the market will seek to maximise his or her self-interest, virtue be damned. While this explanation certainly does fit certain politicians (and it was popular in the 1960s and 1970s to look at the personality and psychology of Johnson and, especially, Nixon to explain such actions), the explanation is limited. All politicians do not act this way. Further, what we experienced in the Vietnam–Watergate period was a system of institutionalised lying unparalleled in US history—not politics as usual; not just certain politicians pursuing their self-interest. Finally, there was a pattern in the lying: it served the end of making or distorting a particular kind of policy, not personal enrichment. And such an explanation alone would not explain this patterning.

A second plausible explanation might locate distortion, lying and secrecy as the natural results of bureaucratic struggle in the Executive Branch (or any large bureaucracy for that matter). As participants with different institutional interests put forward their arguments in bureaucratic struggles over policy, it is natural for them selectively to report certain facts and not others or to distort facts or keep damaging information secret.¹¹ While there are important insights in this explanation, it is not sufficient: it simply argues that there will be lying and deception, but it fails to explain the frequency, intensity, scope or systematic pattern it takes.

A third, and related explanation points to the particular character of the bureaucracy involved: it is a *national security* bureaucracy and it is this which leads it to favour secrecy when possible, and deception and lying when necessary. This historical explanation traces the development of a peacetime security apparatus during the Cold War decades that followed World War II. Its centrepiece was the National Security Act of 1947 and the National Security Council (NSC) it created to integrate 'domestic, foreign and military policies relating to the

¹¹ For an excellent discussion of this phenomenon, see Morton H Halpern, *Bureaucratic Politics and Foreign Policy*, Washington DC: The Brookings Institution, 1974, pp 158–95.

national security so as to enable the military services and the other departments and agencies of the Government to cooperate more effectively in matters involving national security.¹² Critical too were the creation of a Defense Department, which integrated all the services under the Secretary of Defense, with a Joint Chiefs of Staff system and the creation of the Central Intelligence Agency (CIA). As the security apparatus grew, and Cold War tensions mounted, the Executive branch became increasingly unaccountable to Congress, the press and the public in the making of foreign policy. Congress generally acquiesced to administration policies, especially when they were presented as *faits accomplis*. The CIA was developed into an apparatus that not only gathered intelligence but secretly carried out foreign policy, often using covert operations to attempt the overthrow of foreign governments and the assassination of foreign leaders. 'Covert operations . . . required official lies to protect them, and the standard in such cases became not truth, but whether the government's actions were 'plausibly deniable'. In other words, whether the government's lies were *convincing*.'¹³

¹² The National Security Act of 1947 1016, 50 USC' cited in Marcus G Raskin, 'Democracy versus the national security state', *Law and Contemporary Problems*, 40(3) Summer 1976, p 193.

¹³ Wise, *The Politics of Lying*, *op cit*, p 500. A number of other authors make similar arguments. Mortin H Halperin and Daniel N Hoffman, for example, write:

The public's 'right to know' has always been a basic tenet of American political theory. A healthy democracy requires public participation in the formulation and administration of government policy. Full information about policy proposals and debate over alternatives ensure popular consent . . . More recently, however, a competing set of values seems to have received higher priority. Executive branch officials—especially in national security agencies—have consistently sought to insulate their activities from public scrutiny. With the growing attention to and presidential conduct of, diplomacy and defense policy, 'national security' has become a broad cloak under which public policy is actually made in private. Full disclosure, it has been suggested, would jeopardize diplomatic, military, and covert intelligence gathering activities. Accordingly, secrecy has been maintained; efforts to illuminate the workings of the executive—whether undertaken by Congress, the press or the public—have been resisted.

'Secrecy and the right to know', *Law and Contemporary Problems* 40(3) Summer 1976, pp 132–65 at p 132.

Another group wrote:

By the mid-sixties, the dangers posed by a permanent secret realm in a constitutional republic became apparent. The executive branch had developed a conception of national security that had little to do with the defense of the country or the security of the people. The debacle in Vietnam ended the consensus that had survived for over a decade . . . President Johnson and President Nixon both accurately viewed the protests as a threat to their ability to act abroad, a challenge to their definition of national security. The secret intelligence agencies were marshaled to spy on and disrupt the anti-war dissenters . . . Under these conditions programs initially protected merely by secrecy had to be covered up by lies . . . Deception was the routine response to public inquiry.

Mortin H Halperin, Jerry J Berman, Robert L Borosage and Christine M Marwick, *The Lawless State, the Crimes of the US Intelligence Agencies*, Harmondsworth: Penguin, 1976, pp 8–9. See also Marcus G Raskin, 'Democracy versus the national security state', *Law and Contemporary Problems*, 40(3) Summer 1976, pp 189–220.

The President, the Pentagon, the CIA, the NSC and even the State Department felt less obliged to give Congress and the public honest and adequate information about foreign policy issues. Increasingly they operated in an atmosphere where information was kept secret or was distorted in order to avoid public and Congressional 'interference' with questions of foreign policy viewed as too sensitive or too hard to understand by the Executive. The growth of official secrecy through the classification system gave the government an enormous capacity to distort information. And the often misperceived 'needs' of national security frequently gave honourable men the motivation and rationale for deception and lying. Leslie Gelb, director of the task force that produced the Pentagon Papers, has argued that 'most of our elected and appointed leaders in the national security establishment felt that they had the right—and beyond that the obligation—to manipulate the American public in the national interest as they defined it.'¹⁴

The links that this explanation makes between the growth of the national security state and the propensity for secrecy, deception and lying are important ones. There is, indeed, a potential conflict between the often slow, open accountability of constitutional and democratic processes and the demands of many national security elites for speed, discretion, efficiency and secrecy. But national security and democracy are not inherently in conflict: if there is a consensus about the nation's interests and what is necessary to secure them, and if such a policy reflects a realistic understanding of the social forces operating in the world and of the limits of national power, the conflict is likely to be minimised.

Thus, an explanation of the resurgence of official secrecy, institutionalised lying, widespread government distortion, and efforts to quell dissent in Central American policy since the early 1980s cannot simply be explained by the continued existence of a national security apparatus; the problem is not simply a general, abstract, ahistorical conflict between 'national security' and 'democracy'. The explanation also lies in the particular definition of national security—the strategic vision that underlies our foreign policy; the particular importance Central America has taken on for the Reagan Administration within this vision; and the problem of legitimation this policy faces given the breakdown of the pre-Vietnam foreign policy consensus and the new post-Vietnam Watergate commitments.

¹⁴ The citation from an article by Gelb in *Life*, 17 September 1971, p. 35, is cited in Wise, *Politics of Lying*, op. cit., pp. 502-3.

The new doctrine: ideological distortion and the problem of legitimization .

The new formula that emerged after Vietnam and Watergate not only represented a commitment to open up the foreign policy-making *process* to allow a greater sharing, and accountability, in decisionmaking, but also some limited commitment—in Congress and later in the Carter Administration—to alter the *content* of foreign policy. Perhaps most fundamentally, there was a widespread reluctance to send US troops to fight in Third World countries where the goals were not clearly defined and the conflict unpopular at home. Among many, there was an awareness that Third World turmoil was often caused by local conditions of poverty and repression, and that more of a 'North-South' perspective was needed as a corrective to the corrosive effect of the uni-dimensional 'East-West' perspective that prevailed at the time. In his Notre Dame speech of 1977, President Carter charged that post-World War II American policy had been hobbled by an 'inordinate fear of communism' that 'led us to embrace any dictator who joined us in our fear'.¹⁵ Indeed Carter initially led those who sought a 'tolerance of ideological pluralism' and who opposed supporting corrupt, repressive regimes and sought instead to condition foreign military and economic aid on a regime's human rights performance. A few even believed that recognising and assisting left-wing regimes—helping with the reconstruction of Vietnam, for example—might allow these countries an independence from the Soviet Union that would serve US interests. Victory by leftist governments, under this view, would not necessarily lead to an automatic 'domino effect'. Economic ties with the United States would both keep these countries open to US investment, trade and financial interests but also dampen Soviet influence.

But despite movement toward a new direction in foreign policy, the most basic underlying assumptions that guided policy did not change and little was done to dismantle the national security apparatus that continued to define and, therefore, approach problems based on those assumptions.

Perhaps the most important continuity in vision was a widespread acceptance of the doctrine of containment—a commitment to prevent

¹⁵ Cited in Jerry W Sanders, *Peddlers of Crisis, The Committee on the Present Danger*, Boston. South End Press, 1983, p 236.

the 'spread' not simply of Soviet power but of 'communism'.¹⁶ Revolutionary regimes of the left were still considered antithetical to US global interests, and the aim of US policy was still to minimise the chances of such outbreaks and 'take-overs'. Many political conservatives were still ready and willing to use military force—domestic opposition and economic costs be damned—to achieve these ends. Moderates and liberals often sought means other than military intervention: active encouragement of human rights, centrist alternatives to repressive rightist dictatorships and the use of diplomacy and economic leverage were the major ways to prevent leftist revolutions. But underneath the often loud debates between moderates and conservatives the doctrine of containment remained largely unchallenged. Few publicly questioned either the power of the United States to influence the character of Third World regimes or the necessity—indeed the global responsibility—to do so.

Although the Carter Administration began by charting a somewhat different direction in foreign policy—one with a more managerial vision of empire in which both of the pillars of the Cold War, containment and militarism, would be replaced by arms control and trade¹⁷—change in this direction was soon checked. International events (the fall of the Shah, the hostage crises, the Soviet intervention in Afghanistan, the Sandinista revolution in Nicaragua) played a key role, but even more important was the meaning given to these events by a powerful coalition of former national security elites (who organised themselves into groups like the Committee on the Present Danger (CPD) and the Committee for a Democratic Majority (CDM)) who joined forces with mass-based groups of the New Right.¹⁸ The Cold War foreign policy doctrine forcefully put forward by this CPD-led coalition, and the failure of the Carter Administration to 'take the initiative and appeal to the public with a counter-ideology of its own',¹⁹ created domestic pressures that led Carter to move back toward the old Cold War doctrine. When Reagan was inaugurated in January 1981, he brought back into central

¹⁶ Gelb and Betts present a powerful argument that the general doctrine of military containment of communism, institutionalised in the US government bureaucracy, led logically and ineluctably to US military intervention in Vietnam; and they argue further that as long as this doctrine remains unchallenged—indeed as long as there is any 'doctrine' that marginalises pragmatism and dissent—Congressional attempts to enhance checks and balances will be insufficient in getting better policy.

foreign policy positions the key leaders of the CPD²⁰ and his Administration came to embody the Cold War view he shared with them.

The Cold War doctrine that the Reagan foreign policy team brought to office marked a resurgence of a foreign policy vision rooted in the same assumptions of the National Security Memorandum No 68 (NSC-68) of April 1950 (Jerry Sanders aptly labels it 'Containment Militarism' to distinguish it from other doctrines of containment).²¹ The doctrine assumed that the Soviet Union harboured plans for global conquest by military force, and this necessitated a primarily military response by the United States. The era of *détente* was over. The assumption demanded a massive build-up to gain military superiority over the USSR in both nuclear weapons and conventional forces. For many of the policy elites in the Reagan Administration, the distinction between 'containment' and 'rollback' was merely academic: the goal of containment was rollback.²²

According to the doctrine of Containment Militarism, an important element of Soviet strategy was to foster revolutions in the Third World as a means to extend their domination and ultimately overwhelm the United States and the 'free world' by force. All Third World turmoil was thus interpreted in East-West terms and the USSR was considered to be responsible. That this point of view is held by the Reagan

²⁰ The Committee on the Present Danger garnered 'over thirty high-level positions (fifty, if one counts those serving in a part-time capacity)'. In addition to the President (himself a member), these included Richard V Allen, Assistant to the President for National Security Affairs; William J Casey, Director of Central Intelligence; Fred Charles Ikle, Under-Secretary of Defense for Policy; Jeane J Kirkpatrick, US Representative to the United Nations; John F Lehman, Secretary of the Navy; Paul H Nitze, Chief Negotiator for Theater Nuclear Forces; Richard N Perle, Assistant Secretary of Defense for International Security Policy; Richard Pipes, Staff, National Security Council; Eugene V Rostow, Director, Arms Control and Disarmament Agency; and George P Shultz, Chairman, President's Economic Policy Advisory Board and later Secretary of State.

²¹ Sanders, *Peddlers of Crisis*, *op. cit.*, pp 23-50. See also John Lewis Gaddis, *Strategies of Containment*, *op. cit.*

²² This link between containment and rollback was very much a part of NSC 68 too: 'At any rate, it is clear that a substantial and rapid building up of strength in the free world is necessary to support a firm policy intended to check and rollback the Kremlin's drive for world domination.' US National Security Council, 'NSC-68: A Report to the National Security Council, April 14, 1950', *Naval War College Review*, May/June, 1975, p 99. This is also clear earlier in the document with NSC 68's definition of containment:

As for the policy of 'containment', it is one which seeks by all means short of war to 1) block further expansion of Soviet power; 2) expose the falsities of Soviet pretensions, 3) induce a retraction of the Kremlin's control and influence; and 4) in general, so foster the seeds of destruction within the Soviet system that the Kremlin is brought at least to the point of modifying its behavior to conform to generally accepted international standards. (p 68)

Cited in Sanders, *Peddlers of Crisis*, *op. cit.*, pp 24-5.

Administration can be seen in President Reagan's own words: 'Let us not delude ourselves. The Soviet Union underlies all the unrest that is going on. If they weren't engaged in this game of dominoes, there wouldn't be any hot spots in the world.'²³

Secretary of State Haig, in his first news conference, charged that the Soviet Union 'was training, funding, and equipping international terrorism' and went on to allege that the USSR 'today [is] involved in a conscious policy, in programs if you will, which foster support and expand this activity which is hemorrhaging in many respects around the world today.' Haig then went on to explain that 'international terrorism' would take the place of 'human rights' in the Administration's foreign policy.²⁴ The United States would thus have to be prepared to enter into a global struggle with the Soviet Union and Third World countries would be an important terrain of battle. As the *New York Times* explained in November 1980: 'President-elect Ronald Reagan's national security advisers have concluded that "no area of the world is beyond the scope of American interest" and that the United States needs to have "sufficient military standing to cope with any level of violence" around the globe.'²⁵

Underlying this doctrine of Containment Militarism was a messianic vision of the United States fighting for truth, justice and the American way against evil forces controlled by the Soviet Union. President Reagan explained in 1982: 'I have always believed that this anointed land was set apart in an uncommon way, that a divine plan placed this great continent here between the oceans to be found by people from every corner of the earth who had a special love of faith and freedom.'²⁶

The President portrayed the Soviet Union as an 'evil empire', 'the focus of evil in the modern world'. Analysing this messianism in the President's ideology, Arthur Schlesinger wrote: 'Everything follows by deductive logic from this premise. The world struggle is "between right and wrong and good and evil." When there is evil loose in the world, "we are enjoined by scripture and the Lord Jesus to oppose it with all our might."²⁷

²³ Arthur Schlesinger Jr., 'Foreign policy and the American character', *Foreign Affairs*, 62(1), Fall 1983, p. 5.

²⁴ Cited in Sanders, *Peddlers of Crisis*, *op. cit.*, p. 291.

²⁵ *New York Times*, 13 November 1980, cited in Sanders, *Peddlers of Crisis*, *op. cit.*, p. 277.

²⁶ Cited in Schlesinger (1983), *op. cit.*, p. 5.

²⁷ Schlesinger (1983), *op. cit.*, p. 5. This messianic vision was evident in the publications of the Committee on the Present Danger. For example: 'America is more than a superpower. The idea of the United States is a living part of Western Civilization, with a compelling and altogether special history which belongs to all who cherish human liberty.' The Committee on the Present Danger, *The 1980 Crisis (And What We Should Do About It)*, Washington DC, January 1980, p. 9.

Given the reticence of many Americans to support such military expenditures and overseas involvement in the post-Vietnam period, it became important—doubly important given the messianism—morally to ‘rearm’ America and destroy the ‘post-Vietnam syndrome’. During his campaign in 1980, Reagan referred to the Vietnam War as a ‘noble cause’ that could have ended differently ‘if only our government had not been afraid to win’. He promised repeatedly that his mission to ‘rearm America’ included ‘moral rearmament’ as well as ‘military rearmament’.²⁸ In March 1986, during a battle with Congress over military aid for Nicaraguan exiles, he optimistically declared: ‘What we’re seeing is the end of the post-Vietnam syndrome, the return of realism about the Communist danger. And now we’re ready for one of the final acts.’²⁹

Moral rearmament and messianism helped to define the Administration position on negotiation and compromise. Those who took the ideology seriously, understandably, could never support what they saw as a pact with the devil, since the devil could not be trusted. Others were willing to negotiate, but only to calm domestic concerns and remove obstacles for military funding, or to force our enemies into positions that would make their aggressive and evil nature visible to all the world.

Over the course of time, important policymakers within the Reagan Administration—the pragmatists, for want of a better word—did respond to pressures at home, from the European allies of the United States and somewhat to the realities of the situation. Occasionally, they were able to convince the White House to pursue a less dogmatic policy. The Administration finally backed away from its pipeline embargo when that policy enraged the Europeans; it warmed relations with China although ideology called for support of Taiwan; the President had a cordial summit meeting with Mikhail Gorbachev; urged ‘Baby Doc’ to leave Haiti; and at the eleventh hour, the President was ultimately willing to withdraw support from a loyal, anti-communist friend, President Ferdinand Marcos in the Philippines. But in Central America, the ideologies have prevailed almost from the beginning.

Even before Reagan was elected, the Committee on the Present Danger had defined Central America as an area of vital concern:

²⁸ Cited in Sanders, *Peddlers of Crisis*, *op. cit.*, pp 294–5.

²⁹ Gerald M Boyd, ‘Reagan sees a “moral obligation” by US to aid Nicaraguan rebels’, *New York Times*, 11 March 1986.

in the Caribbean . . . the Soviet Union has been steadily improving its position. Soviet planes, submarines, and combat troops are based in Cuba, and military assistance has been given from Cuba to revolutionary movements in Nicaragua, El Salvador, and other countries in the area. A potential is being built up from which the Soviet Union can threaten our Atlantic sea-lanes, our communications with Central and South America, and the territory of the United States itself.³⁰

When a reporter asked one of Reagan's foreign policy advisers during the 1980 Presidential campaign if Reagan really believed his own rhetoric about the communist menace in El Salvador the adviser replied: 'El Salvador itself doesn't really matter . . . we have to establish credibility because we're in very serious trouble.'³¹

When Secretary of State Alexander Haig briefed Congressional leadership on the State Department's White Paper in February 1981 he spoke of the importance of 'drawing the line' against 'communist aggression' in El Salvador.³² The turmoil in Central America was clearly part of a global struggle. Haig explained:

What we are watching is a four-phased operation of which phase one has already been completed—the seizure of Nicaragua. Next is El Salvador, to be followed by Honduras and Guatemala . . .

I wouldn't necessarily call it a domino theory. I would call it a priority target list—a hit list, if you will, for the ultimate take-over of Central America.³³

As such, US security was at stake. Assistant Secretary of State Thomas O Enders explained: 'The dangers are rising fast . . . If, after Nicaragua, El Salvador is captured by a violent minority, who in Central America would not live in fear? How long would it be before major strategic US interests—the Canal, sea-lanes, oil supplies—were at risk?'³⁴

As the Reagan Administration plunged the United States progressively deeper into Central America, it became even more apparent that the vision which guided foreign policy there was highly doctrinaire and dogmatic: it was ahistorical, ungrounded in empirical reality, and likely to exclude important facts that did not fit into its dualistic, Manichean vision. The policymakers of the Reagan

Administration were 'crusaders'³⁵ or 'ideologues', in the sense that they could 'be defined as one who knows the answers before he knows the facts'.³⁶

Arthur Schlesinger Jr., referring to this phenomenon in the Reagan Administration, writes

The seizure of foreign policy by a boarding-party of ideologues invites a host of dangers. Most of all you tend to get things wrong. Where the empirical approach sees the present as emerging from the past and preparing for the future, ideology is counter-historical. Its besetting sin is to substitute models for reality. No doubt the construction of models—logically articulated, general principles leading inexorably to particular outcomes—is an exercise that may help in the delineation of problems—but not when artificial constructs are mistaken for descriptions of the real world.³⁷

The characteristic of such crusaders or ideologues is that their vision badly distorts reality. They are likely to distort the world to fit their doctrine rather than make their doctrine conform to the world; and they are tempted to eliminate or play down, or often not even see, facts which challenge their vision. The effect, if not always the intention, is the production of lies and deception. But if the dogmatic character of Containment Militarism puts it out of touch with a changing world and distorts reality, the problem of deception and lying is compounded when the particular content of this doctrine comes up against the problem of legitimation within a constitutional democracy.

The problem of legitimation

Inside a constitutional democracy, a primary aim of the political leadership needs to be the creation of a policy that is considered legitimate, the building of a foreign-policy consensus. As long as a policy is perceived as illegitimate by major sectors of the citizenry or interest groups, there is going to be a collision over foreign policy—as there was over the Vietnam War. This is particularly the case when foreign policy is based on a doctrinaire, moral absolutism.

This belief in a special American mandate and the temptation to believe in American omnipotence collide not only with the stubborn realities of a world in which the United States is powerful but not dominant; they also collide with our democratic process. First, democratic institutions and the inherent American mistrust of strong central institutions make it hard for any President

³⁵ John Stoessinger, *Crusaders and Pragmatists*, New York: W W Norton (2nd edition), 1985.

³⁶ I M Destler, Leslie Gelb and Anthony Lake, *Our Own Worst Enemy, The Unmaking of American Foreign Policy*, New York: Simon and Schuster, 1984, p 22.

³⁷ Arthur Schlesinger (1983), *op. cit.*, p 6.

to carry out the strong foreign policies called for by the American vision of our role in the world. In addition, democratic pluralism tends to produce policies of compromise, of limited means dwarfed by our grand goals. And compromise, in a moral struggle, is easily seen as a sin. Thus, the way in which we make foreign policy is inherently in tension with the absolute morality that we continue to impose on our view of the world.³⁸

This tension makes it tempting for some foreign-policy elites to resolve the dilemmas by 'putting tighter boundaries on democracy itself when national security is at stake'.³⁹ Although Watergate was one dramatic instance of how a President can threaten democracy in order to save it, the pattern of restricting democracy has been prevalent in the post-World War II period.⁴⁰ And there have been numerous instances under President Reagan's Administration where pursuit of his Central America policy had circumvented constitutional checks and balances and broken the law⁴¹ when democratic institutions put obstacles in his path.⁴²

³⁸ I M Destler *et al.*, *op. cit.*, p. 85.

³⁹ I M Destler *et al.*, p. 86.

⁴⁰ Arthur Schlesinger, *The Imperial Presidency*, Boston: Houghton Mifflin, 1973.

⁴¹ For a full discussion of such circumvention see Kenneth E Sharpe, 'US Central America policy abroad at home', Paper prepared for the Conference on the United States and Central America, A Five Year Assessment, 1980-1985, held at the University of Southern California, 20-22 February 1986. For some brief examples, see also Kenneth E Sharpe, 'Congress may get caught in the President's imperial trap', *Miami Herald*, 21 April 1985; Jim Leach *et al.*, *op. cit.*, *US Policy in Central America. Against the Law?* Washington DC: Arms Control and Foreign Policy Caucus, 11 September 1984.

⁴² Neither circumvention nor law-breaking have been limited to policy on Central America. The case of the bombing of Libya also well illustrates many of these same problems. An excellent discussion of the issue and its relation to democracy can be found in the testimony given by J Brian Atwood on the War Powers Act in the wake of the Libyan bombing, before the House Foreign Affairs Committee in April 1986.

In my work in democratic development for the National Democratic Institute, I have been reminded that democracy is always a fragile system. Those of us who are privileged to be citizens in democratic states must pay attention not only to preservation of our individual liberties, but also to the strength of our institutions, to the smooth functioning of the mechanisms of government and, most importantly, to the rule of law. When we do not, when we become arbitrary and capricious, we contribute to the anarchy to which our non-democratic opponents wish us to succumb.

... it is my belief that in this particular area [the War Powers Resolution] the Administration has done serious damage to our own democracy. It has done this by refusing to respect fully the prerogatives of another separate-but-equal governmental institution, by inhibiting the smooth functioning of the mechanisms of government and by weakening the rule of law through a process of obfuscation and rationalization.

The current Administration has gone much further than any of the previous ones in rationalizing away its statutory responsibility to consult with and report to Congress under the War Powers Resolution. In the process, the vitally important concepts of collective decision-making and shared powers have been dealt a grievous blow in our most important area of governance' (pp. 18-19).

J Brian Atwood, Testimony before the House Committee on Foreign Affairs, US House of Representatives, 29 April 1986.

A foreign policy is always going to have to face the problem of legitimation to some extent. But legitimation becomes a serious problem the more the policy violates fundamental American values and the more it is perceived as too costly, dangerous, or antithetical to US interests. In addition to such legitimation at home, there is also the problem of international legitimacy. It is in the interest of a democracy like the United States to appear internationally legitimate because exercising influence on the basis of moral authority is less costly and, in the long term, more reliable than force. But the problem of international legitimacy is particularly important when policies require particular support—or at least lack of opposition—from close allies and friends. The criteria by which legitimacy is to be judged change historically, and one of the central problems for the Reagan Administration is that it has not been able to make its policy appear legitimate to important political forces at home and abroad.

This was not for lack of effort. First the CPD-led coalition and later the Reagan Administration tried to re-create the old 'consensus' that had supported Containment Militarism throughout the 1950s and the 1960s. While they had been successful at home in blocking the creation of a new post-Vietnam consensus based on *détente*, arms control, trade, and tolerance of ideological diversity, they were unable to forge a consensus of their own, one strong enough to eliminate the legacies of *détente* and Vietnam. And abroad, they were often unsuccessful at getting strong backing from US allies.

The major countries of Western Europe were by no means ready to give up *détente*, and looked for improved trade and closer economic ties with the Soviet Union. Further, these governments faced important domestic forces that were deeply concerned about the risk of nuclear war; concerned that the policies of the Reagan Administration could trigger catastrophe. They were unwilling to give support to what they saw as militaristic US policies toward Central America; they refused to go along with economic sanctions against Nicaragua; and several (including France, Spain and the Netherlands) openly urged diplomatic settlements antithetical to the Reagan strategy. They were joined by important regional powers (Mexico, Venezuela, Panama and Colombia—the Contadora countries—and later Peru, Argentina, Brazil, and Uruguay) who also urged an end to US support for the 'contras', and a diplomatic solution to regional tensions which recognised the legitimacy of the Sandinista government and of left-wing insurgents in El Salvador.

Here at home, there still remained a widely-held fear of sending American troops on a Third World venture that would be costly and prolonged.⁴³ There remained a widespread fear of nuclear war. Moderates in Congress, important citizens' groups, and, increasingly, major churches and religious organisations remained deeply committed to a policy that supported human rights; found aid to corrupt dictators and brutal militaries repugnant; and believed that US aid should be restricted to democratic allies, not authoritarian regimes, however 'anti-communist' they might be. Many of the 'managerialists' who had backed the Trilateral approach were concerned with the negative impact of high military spending on deficits, and thus on interest rates, the US balance of payments, and on the trade that the transnational banks and corporations financed or undertook.

As a result of such attitudes, Administration foreign policy often faced serious legitimisation problems. Opposition to its nuclear war-fighting strategy soon spread from Europe to the United States; the very rhetoric of fear used by the Administration to justify the unparalleled arms build-up also helped to generate the freeze movement.⁴⁴ The sabre rattling in Central America, far from rallying public support for aid to the Salvadoran military, generated stiff opposition. Indeed from 1981 until the election of José Napoleon Duarte as President of El Salvador in mid-1984, such resistance—most troubling for the Administration in Congress—stiffened. To many Americans it was morally unacceptable to be aiding the savagery of the Salvadoran military and the death squads; and even more people were concerned that increased military aid and advisers would drag the United States once again into a Vietnam-like quagmire. The Administration faced stiff resistance to its military support for the 'contras'—branded by many in the US as *our* 'proxy army'. Although there was only scattered sympathy for the Sandinista revolutionaries in the United States, the terror tactics of a 'contra' army led by officers of the former Nicaraguan dictator, Anastasio Somoza, caused great consternation; moderates in Congress were further concerned that the alternatives being promoted by the Contadora countries were being undermined or rejected by the Administration, and that our military strategy would trigger a regional war that would draw US troops into a difficult and unpopular conflict.

⁴³ While the Administration's efforts to convince the public of the dangers of communism in 'our backyard' no doubt contributed to majority support for wanting to keep communism out of Central America, many of the same people who oppose such communist regimes also are opposed to intervention by US troops.

⁴⁴ Sanders, *Peddlers of Crisis*, *op. cit.*, pp. 324–38.

The problem of legitimising Central American policy was compounded by the gap between the reality in the region and the distorted picture framed by the lens of Containment Militarism.⁴⁵ The information that came back from press reports and independent observer teams—many already sceptical of government reporting given the Vietnam experience—was often at odds with the Administration's version. The contrary evidence constituted a serious challenge: to the Administration's portrayal of the significance of the Soviet Union and Cuba in causing or sustaining the upheaval in the region; to the Administration's portrayal of El Salvador as a democracy and of Nicaragua as totalitarian; to the Administration's assumption of expansionist designs on the part of Nicaragua and the offensive character attributed to its military build-up; and to the Administration's often optimistic reports of military capability and popular support for both the Salvadoran army and the 'contras', and the weakness and unpopularity of the FMLN and the Sandinistas. It also showed that the Administration was exaggerating human rights violations in Nicaragua and minimising such violations in El Salvador and Guatemala; and it raised doubts about the sincerity of the Administration's proclaimed interest in political solutions to regional conflicts.

Given the generally doctrinaire, dogmatic character of the Reagan foreign policy, and given its particular vision (of good and evil; of global threat; of the need to draw lines, to demonstrate credibility, and stop the spread of cancer-like communism) we could anticipate various ways in which the Administration would respond to the problem of legitimation. Three patterns seem to be especially relevant for this analysis.

First, we would expect them to move to 'privatise' the conduct of foreign policy. This would mean restricting the flow of information by means of security classification, and shifting many activities to covert operations, both of which would have the effect of minimising public scrutiny.

Secondly, we would expect them to seek to legitimate their policy claims. In short, they would turn to deception, misinformation, distortion or flat-out untruths to establish or maintain the fiction that

⁴⁵ For one discussion of changed post-World War II reality in Central America, and how the assumptions of the strategic vision distorted that reality, see Morris Blachman, William LeoGrande and Kenneth Sharpe, *Confronting Revolution: Security Through Diplomacy in Central America*, New York: Pantheon Books, 1986, Chapter 13.

North-South Monitor

Both the Interim and the Development Committee endorsed the Baker initiative on international debt, launched at the previous IMF and World Bank meetings in Seoul in October 1985.⁴⁴ They reaffirmed the need for a continued case-by-case approach to debtor countries. In its communiqué,⁴⁵ the Interim Committee urged the industrialised countries to pursue policies with a view to maintaining open markets, liberalising trade, enhancing growth, reducing exchange rate volatility and encouraging lower interest rates. It advocated the continuation of coordinated financial support from both official and private creditors, to debtor countries 'implementing sound economic policies', including those adversely affected by the decline in oil prices. In his speech to the Interim Committee, US Treasury Secretary, James Baker, was more explicit in urging developing countries to assist themselves further by undertaking structural adjustment as a means of promoting economic growth. He advocated reforms including those in pricing policy, public enterprise, divestiture, tax and the labour market, as well as financial sector development and trade liberalisation. His premise appeared to be that recent economic developments in the industrialised countries, such as falling interest rates and higher projected growth, would afford in the next two years the best external environment for developing countries since the early 1970s. Baker also advocated an increased role for the IMF in areas traditionally regarded as the World Bank's domain. G24 ministers, by contrast, pointed to what they saw as the failure of the current approach to debt management to find a definitive solution to the debt crisis, and referred back to their earlier Buenos Aires communiqué (see above).⁴⁶

In line with the conclusions of the Group of Ten industrialised countries at their meeting,⁴⁷ the Interim Committee rejected the idea of replacing the current system of floating exchange rates with 'target zones', though expressing concern for exchange rate volatility and misalignment of currencies. It accordingly instructed the IMF Executive Board to consider further modifications of the exchange rate system which could contribute to exchange rate stability without compromising flexibility. Following a G10 pledge to strengthen international economic coordination, with a correspondingly enhanced role for the IMF in surveillance, the Interim Committee agreed to explore the potential for such coordination between the major industrialised economies. In particular, it asked the Executive Board to consider means of enhancing cooperation on external imbalances, exchange rate developments and policy interaction, including the possible use of 'objective indicators', by which to determine the compatibility of different countries' policies. The G10 had been unable to agree on a firm commitment to such quantitative indicators owing to objections from West Germany and Japan, but had recognised that they 'might be useful' in assessing policy consistency. The Interim Committee communiqué also welcomed the prospect of a reduction in the US budget deficit and, in an obvious reference to Japan and West Germany, suggested that countries with trade surpluses and low inflation, whose economies were operating below capacity, could consider more growth-oriented policies.

The Committee failed to accept G24 suggestions for a representative committee of ministers and a committee of deputies to consider specific proposals for reforming the international monetary system, or for an international monetary conference in 1986. Nor did it agree to the G24 proposal for the creation of a compensatory facility for countries suffering from the fall in oil prices. Once again,

Carter Administration) to impose secrecy and control information. But this trend has been dramatically accelerated during the Reagan Administration.

For example, on 2 April 1982, the President, after failing to get Congress to weaken the Freedom of Information Act, signed an executive order which did so by fiat: he not only reversed Carter's classification reforms but instituted the broadest security classification system in American history.⁴⁸ The Intelligence Identities Protection Act, passed by Congress and signed into law on 23 June 1982, has the effect of prohibiting the press from publishing certain information even when it is already in the public domain, and it arms the executive with an important device for censorship. In March 1983 the White House attempted to impose a secrecy order (Presidential Directive Safeguarding National Security Information) that would have instituted the broadest secrecy system in the history of the United States and provided a powerful tool for quelling public criticism, had it not been blocked by Congress, at least temporarily. And these represent only the tip of a chilling iceberg.⁴⁹

Given this context it is not surprising that the Reagan Administration would seek to pursue certain Central American policies in private. The purpose of such secrecy was not merely 'security', as was so often claimed; it has often been used to mislead the public, not the 'enemy', when foreign policy might be considered illegitimate and risk generating domestic opposition.

⁴⁸ See Ehlke and Relyea (1983), *op. cit.*, pp 94-6. They conclude:

During the past thirty years, succeeding presidential classification directives have narrowed the bases and discretion for assigning official secrecy to Executive Branch documents and materials. E.O. 12356 appears to reverse this trend in three general ways: the protection of information is emphasized disproportionately over the public accessibility of government records; some previous value limitations on classification criteria and discretion are eliminated, and other new broad conditions for classification are established. Indeed there is considerable concern that the policy changes made by the executive order will prompt more frequent resort to classification and, consequently, will increase the quantity of official secrets. (p 94)

⁴⁹ Some of the leading articles which discuss these threats to the free flow of information, civil liberties and constitutional democracy are: John Shattuck, 'Congress and the Legislative Process', in *Our Endangered Rights, The ACLU Report on Civil Liberties Today*, Norman Dorsen (ed), New York: Pantheon, 1984, pp 46-74; Mortin H Halperin, 'National security', in Dorsen, *Our Endangered Rights*, pp 281-95; Floyd Abrams, 'The new effort to control information', *New York Times Magazine*, 25 September 1983, pp 22-8, 72-3; John Shattuck, 'National security a decade after', *Democracy* 3(1), Winter 1983, pp 56-70; and Walter Karp, 'Liberty under siege, the Reagan Administration's taste for autocracy', *Harper's*, 271 (1626) November 1985 pp 53-67; *Less Access to Less Information by and About the US Government: A 1981-4 Chronology*, Washington DC: American Library Association, December 1984.

The Administration, for example, tried to circumvent Congressional debate on building US bases in Honduras and permanently stationing troops there by organising permanent ongoing manoeuvres which were then used as a 'cover' for diverting funds from other sources and for allowing a continuous US military presence in the area.⁵⁰ But perhaps the most important example was the 'covert war' of US-financed and US-trained Nicaraguan exiles, the 'contras', against the Sandinistas and the Nicaraguan people.

On 23 November 1981 President Reagan signed National Security Decision Directive 17 and a secret 'finding' that was submitted to the House and Senate Intelligence Committees informing them that \$19.95 million in CIA funds would be used to support 500 'contras' who would infiltrate Nicaragua to interdict purported arms flows to Salvadoran rebels.⁵¹ By so informing these Congressional committees, the Administration was apparently following the letter of the law.

But while some in the Administration may have initially supported the programme because they believed it was to interdict arms, major actors—the exiles the CIA was funding, CIA operatives in the field, and hard-liners in the Administration—had a very different purpose: the overthrow of the Sandinista regime.⁵² This view became even more prevalent as the operation grew in 1982 and 1983. The so-called soft-liners, mostly in the State Department, did not sign-off on overthrow, but saw building up the 'contras' as creating a credible threat

⁵⁰ During the US manoeuvres in Honduras, for example, the Defense Department used funds out of the budget category called Operations and Maintenance (which is supposed to function as petty cash, not major military financing) to train and equip Honduran forces (such as providing radar and surveillance equipment) and to build permanent basing facilities (nine airstrips were built or improved, only two had been approved by Congress). It was only when Congressional committees grew suspicious and tracked down press reports, that the Administration's actual activities came to light. Furthermore, the manoeuvres, which began in August 1981, turned out to be nearly continuous and thus had the effect of permanently stationing 700 to 1000 US military personnel in Honduras and thousands more on ships off the coast—all without Congressional consultation or authorisation. Because these assignments were temporary duty, *per diem* is paid, thereby also increasing the cost of the whole operation.

⁵¹ Robert C Tooth and Doyle McManus, 'Contras and CIA: a plan gone awry', *Los Angeles Times*, 3 March 1985; and Robert C Tooth and Doyle McManus, 'CIA mining of harbors "a fiasco"', *Los Angeles Times*, 5 March 1985.

⁵² See for example, David Ignatius and David Rogers, 'Aiding the contras', *Wall Street Journal*, 5 March 1985; and Doyle McManus and Robert C Tooth, 'The contras: How US got entangled', *Los Angeles Times*, 4 March 1985. McManus and Tooth report, for example, Edgar Chamorro, then a member of the 'contra's' political directorate, said CIA officials left no doubt about their real goal: 'In private they always told us the objective was to overthrow the government in Managua . . . They always said, "The President of the United States wants you to go to Managua"'. And by 1983, Administration public rhetoric notwithstanding 'Casey made no bones about it', according to one senior State Department official.

with which to pressure the Sandinistas to bargain over security issues, and ultimately over the internal character of their regime.⁵³ But the real purposes (for example, significantly increasing the size, scope and range of 'contra' operations) of this part of Reagan's Nicaraguan policy were not shared with the appropriate Congressional committees for their scrutiny and debate, as is required by law.⁵⁴ It was only in the following years, as Congress took a more active role, that the Administration eventually introduced the pressure logic. The President's public position until the 1985 Congressional debates had been, as Reagan would misleadingly say, 'We are not doing anything to overthrow the government of Nicaragua.'⁵⁵ This verbal fiction had enabled the Administration to avoid complying with the Boland Amendment which had prohibited the US from providing 'military equipment, military training or advice, or other support for military activities, for the purpose of overthrowing the Government of Nicaragua or provoking a military exchange between Nicaragua and Honduras.' Speaker of the House, Thomas P O'Neill had stated in regard to the actual policy of the Administration in continuing to provide support to the 'contras', 'the President of the United States broke the law and then laughed to the American people that he broke the law.'⁵⁶

Thus throughout the operation, an effort to misinform or deceive the Congressional committees regarding overall goals—and, it would turn out, very important details—was a crucial element of the policy. But perhaps even more important was the very decision to take the covert route in the first place. Such secret wars are never secret from the people being warred upon, and they are not long secret from Congress and the American public. As early as 4 December 1981 articles began to appear

⁵³ Tooth and McManus, 'The contras' *op. cit.*

⁵⁴ Atwood's testimony on the air strike in Libya and the non-use of the War Powers Act also illustrates the degree to which the Administration is willing to keep Congress, not to speak of the American public, in the dark and out of the decision-making loop.

A full week before the air strike the Administration was confirming newspaper stories to the effect that US forces were being brought into position for a possible attack. Ambassador Walters made the rounds of NATO allies advising them of our plans and requesting assistance . . .

. . . yet Members of Congress were not called in for consultations until three hours before the strike, after the planes were on their way. This was not compliance with Section 3 [of the Resolution], nor was it consultation in the true sense of the word.

J Brian Atwood, Testimony given to the House Committee on Foreign Affairs, US House of Representatives, 29 April 1986, p 10.

⁵⁵ Tooth and McManus, 'The contras' *op. cit.*

⁵⁶ *New York Times*, 27 May 1983.

in the American press⁵⁷ about the covert US action, and by February and March of 1982 these reports were even more detailed. They were paralleled by reports from Florida about training camps for the 'contras' and then reports from the field about 'contra' activities. The real reason for the secrecy was not to keep information from the Nicaraguan government, which knew full well about the 'contras',⁵⁸ but to keep policymaking private. If the President had come to Congress in 1981, and asked for funds to *create* an exile army, led by officers of deposed dictator Anastasio Somoza's National Guard, to overthrow the Sandinista government, it is clear that such funds would not have been approved. The plan would have been opposed as illegal, impractical, immoral, dangerous to the international prestige of the United States, and as creating a situation which might drag in US troops. The critical element of covert operations, commented Mortin Halperin in May 1982, is that

they remain beyond the reach of the American political process. Congress cannot deal with them because they are supposedly secret and, therefore, there cannot be hearings about them. Administration officials, who would never decline to speak and debate on public aspects of American policy, can refuse . . . because covert operations are secret. Any member of Congress who seeks to get a debate on the Foreign Aid bill about whether we should conduct covert operations against Nicaragua will be accused of undermining the security of the United States, of revealing secrets . . . So, I think we have to recognize the ultimate secret, which is that the purpose of covert operations is to subvert the democratic process within the United States.⁵⁹

Deception and dishonesty: justifying the policy by creating a false social reality

When it has been inadvisable, or impossible for the Reagan

⁵⁷ See, for example, William Beecher in the *Boston Globe*, 4 December 1981, who reported that a decision had been made by the National Security Council to 'press covert action in Nicaragua and El Salvador' and to 'infiltrate hostile elements into these countries'.

⁵⁸ In November 1981, one of the authors met with the then Nicaraguan Ambassador, Arturo Cruz. Ambassador Cruz, who is now one of the political leaders of the 'contra' opposition, spoke of the incursions which had been coming across the border from Honduras into Nicaragua for some time. He said that the Nicaraguan government had already met on this issue and come to a policy decision as to how to handle them. If the incursions did not include US forces, then, even if it involved Honduran troops, the Sandinista government decided it would stand and fight. If, however, the incursion was part of an invasion of US troops, the Sandinistas decided they would not be able to handle a direct confrontation. In that case, they would take to the hills and begin an insurgency campaign. This all took place *prior* to the November 1981 NSC decision to support 'contra' activity.

⁵⁹ Mortin Halperin, 'Statement', *US Covert Operations Against Nicaragua. A Public Forum*, Washington DC: Campaign for Political Rights, 1982, p. 32.

Administration to conduct policy in private, the problem of legitimization could not be avoided. On issues where the Administration's rationale for policy was challenged because it violated American values or was perceived as too costly or dangerous to US interests, a pattern of deception and lying emerged: efforts were made to make the Central American reality fit the vision and justifications of Containment Militarism.

The export of revolution: the Soviet-Cuban-Nicaraguan connection The picture of reality painted by the Administration has been that the political turmoil in Central America is Soviet-dominated and Cuban-orchestrated. This image has been extremely important for justifying policy. To the extent that upheaval has internal roots based in poverty, inequality or the repression of US-backed regimes, the revolutionary struggles would appear legitimate to many Americans, particularly in the post-Vietnam period; to the extent that they were nationalist, not foreign controlled, their threat to us would be minimal. The Administration has constantly struggled to discount or deny facts that challenged its interpretation in an effort to present a distorted image of reality to the American public.⁶⁰

The major Administration argument as to the 'foreign' (i.e., Soviet) character of these 'exported' revolutions has rested on evidence that insurgents in El Salvador were armed, trained, and directed by Nicaragua and Cuba. In putting forward such arguments, the Administration played down the indigenous histories of these revolutions.⁶¹ If the Administration's presentation of history was distorted, the further presumption that any evidence of external arms shipments automatically proved external control was misleading.

In the first place, the Administration failed to distinguish between arms coming in through the black market and those actually provided by the Cubans and Nicaraguans. Second, the conclusion that foreign weapons prove foreign obedience was highly questionable. We should know better, as even the United States has often been able to exert only

⁶⁰ James Reston devoted an entire column to the problem of lying deception by the Administration. Referring to Congress and the press, he laments that 'they have been told so many lies about the Nicaragua problem by the Administration . . .'. He goes on to suggest that 'there have been so many deceptions and lies about Nicaragua that Congress and the Press are beginning to rebel'. 'The lie detectors', *New York Times*, 5 March 1986.

⁶¹ For a good critique of such arguments in their most sophisticated form, see William M LeoGrande, 'Through the looking glass: the report of the National Bipartisan Commission on Central America', *World Policy Journal*, Winter 1984, pp 255-64.

very limited control over regimes to which it supplied arms. To make matters worse, the Administration continually exaggerated and distorted the actual amounts of external arms flows to the insurgents in order to strengthen its *a priori* deduction of Soviet-Cuban-Nicaraguan responsibility for the local turmoil. The most well-criticised instance of such distortion was the Administration's February 1981 White Paper which argued that Cuba and the Soviet Union had orchestrated the shipment of 200 tons of arms from socialist and radical Arab states.⁶² Despite the embarrassing fact that the Administration was unable to provide any significant public evidence of such shipments in later years, it has continued to use these claims to back its 'external aggression' thesis flying in the face of strong evidence to the contrary.⁶³

Nicaragua as a threat to its neighbours Nicaragua's threat to its neighbours is presented as a logical deduction of the Containment Militarist vision of global struggle which, it is argued, is pursued by a Soviet regime that seeks world domination and that has its hand behind every Marxist government, pulling the strings. Each time the Administration goes to battle in Congress for support of its 'contra' policy, it has sought to raise the stakes by puffing up the image of Nicaragua as a serious threat to its neighbours, and of US aid as the defensive measure against such aggression. In early 1985, for example,

⁶² *Communist Interference in El Salvador*, US Department of State, Special Report Number 80, 23 February 1981. Among the critiques of this report, see John Dingex, *Los Angeles Times*, 17 March 1981; Robert Kaiser, 'White Paper in El Salvador is Faulty', *Washington Post*, 9 June 1981; Jonathan Kwitny, *Wall Street Journal*, 8 June 1981; and James Petras, *The Nation*, 28 March 1981.

⁶³ The Administration has given little public evidence as to the significance of source of outside military assistance. Middle-ranking diplomats at US embassies in El Salvador, Nicaragua, and Honduras have expressed doubt that the weapons from Nicaragua represent the majority of arms in rebel hands. See Stephen Kinzer, 'US and Salvadoran officials note steady rebel gains', *New York Times*, 25 April 1983. An experienced intelligence officer in El Salvador reported in March 1983 that military aid from Nicaragua and Cuba is not a key factor in the Salvadoran guerrilla campaign. Many have been captured from the Salvadoran army, the national guard and the police. See Drew Middleton, 'Salvador's army's troubles', *New York Times*, 5 March 1983. In July 1983 officials in El Salvador and Washington said that the flow of military supplies to Salvadoran rebels from outside the country had been only a trickle for many months. One knowledgeable source said that the major army and air force ammunition dump at Ilopango Air Force Base was 'also a guerrilla supply warehouse.' Middlemen for the guerrillas were buying 81-millimetre mortar shells for about \$5 a round. See Charles Mohr, 'Salvador rebels reported to get little arms aid', *New York Times*, 31 July 1983. A former CIA analyst, David MacMichael, who left the agency in July 1983, and who had access to the most sensitive intelligence about arms shipments, concluded: 'The Administration and the CIA have systematically misrepresented Nicaraguan involvement in the supply of arms to Salvadoran guerrillas to justify its efforts to overthrow the Nicaraguan Government', in Philip Taubman, 'In from the cold and hot for truth', *New York Times*, 11 June 1984. See also the detailed report by Julia Preston, 'Proof of arms smuggling into Salvador lacking', *Boston Globe*, 10 June 1984.

as the Congressional battle for aid heated up, the President accused the Nicaraguans of building 'a war machine' that 'dwarfs the forces of all their neighbours combined'. Vice-President Bush belittled 'some who still insist' that 'these Marxists have no extraterritorial ambitions.'⁶⁴ Yet to make Nicaragua's largely defensive build-up (itself a response to the 'contra' policy) appear as evidence of offensive intent, the Administration had to resort to lies and distortions. A brief summary of some of the issues was provided by the *New York Times*:

Senior Administration officials, in speeches and in public reports, have frequently said Nicaragua intends to attack its neighbors. But State and Defense Department officials say unofficially that they do not believe Nicaragua has any such intention.

President Reagan has said that 'the Sandinista military build-up began two and a half years before' the United States-backed Nicaraguan rebels took up arms and was not a result of rebel attacks. But Defense Department records show that the first shipment of heavy Soviet-made arms to Nicaragua came many months after the first reports of rebel attacks.

Nicaraguan officials have said one reason for their build-up is that they fear an American invasion. Administration officials confirmed that since at least 1983, the United States had used a 'perception management' program, as a classified Defense Department document called it, to keep the Nicaraguans concerned that the United States might attack.

White House and State Department officials were unable to verify the accuracy of several quotations that the President and others have attributed to Nicaraguan leaders in support of their assertions about Nicaragua's intentions. In one case, the State Department acknowledged that it knew of no Sandinista official who ever used an often-quoted phrase that Nicaragua seeks a 'revolution without frontiers.'⁶⁵

The Soviet threat to US security In 1981, Jeane Kirkpatrick warned that the United States already faces 'an unprecedented need to defend itself against a ring of Soviet bases on and around our Southern border.'⁶⁶ While there were not then, and are not now, such Soviet bases, such statements are testimony to the current doctrine's contention that Nicaragua is dominated by the Soviet Union (it is already 'behind the iron curtain', Secretary of State Shultz declared in 1985), and that the building of Soviet bases is highly probable, if not

⁶⁴ Joel Brinkley, 'Nicaraguan army: "war machine" or defender of a besieged nation?', *New York Times*, 30 March 1985.

⁶⁵ *Ibid.*

⁶⁶ Cited in William M LeoGrande, 'Reagan's counter-revolution in foreign policy', *New Catholic World* September/October 1981, 224 (1343), p 219.

inevitable. The base argument is one of a number of such rhetorical arrows. Also in the 'security threat' quiver are purported threats to vital sea-lanes and the Panama Canal. Individually, each argument is highly suspect: the Administration starts with a dubious possibility and transforms it into a likely probability.⁶⁷ While such security issues are serious, the Administration's willingness to distort and mislead in order to generate support for its policies has made rational public debate about these issues difficult. Their arguments have also served the purpose of diverting attention from the willingness of Nicaragua, backed by the Contadora countries, to negotiate guarantees that such bases will never be built and that the other potential threats will be minimised.

The involvement of US troops Because one of the most widespread concerns about American policy in Central America was the possible involvement of US troops in another Vietnam, it is not surprising that the Administration has continually assured Congress and the public that military aid and US advisers would not risk such involvement—or, on occasion (such as the battle over 'contra' aid in April–June 1985 and March 1986)—that failure to give aid might create the need for US troops. When faced with potentially damaging counter-evidence, the Administration often distorted information or lied.

The War Powers Act demands that the President report to Congress within forty-eight hours when US troops are introduced 'into hostilities or into a situation where imminent involvement in hostilities is clearly indicated by the circumstances'. Yet the Administration continually maintained, 'We are not putting our people in a situation where there is any imminent danger of hostilities'⁶⁸ despite the fact that US military were stationed in brigade headquarters throughout zones of conflict, travelled to the site of combat, came under fire in at least eight separate incidents (by early 1985), flew reconnaissance missions over Salvadoran battlefields, and participated in naval interdiction activities in the Gulf of Fonseca.⁶⁹

⁶⁷ For a fuller discussion and critique of each of these arguments see Morris Blachman *et al.* *op. cit.*, 1986, Chapter 13.

⁶⁸ Langhorne Motley, before the House Subcommittee on Western Hemisphere Affairs, 2 May 1984 (cited in *In Contempt of Congress*, p. 39).

⁶⁹ Jim Leach *et al.* *US Aid to El Salvador. An Evaluation of the Past, A Proposal for the Future*. Washington DC: Arms Control and Foreign Policy Caucus, February 1985, pp. 6 and 24. This report also documents a number of other instances of insufficient, misleading, or false information by the Executive to Congress regarding El Salvador. See pp. 1–7. Leach *et al.* *US Policy in Central America op. cit.*, discusses how the administration has violated the reporting requirement of the Arms Exports Control Act as well as the War Powers Resolution, pp. 28–9, 33–4.

According to one Congressional study, the Executive Branch has also 'provided false information to Congress concerning the number of US military personnel operating in El Salvador, about the roles they are performing, and about the duration of their presence there'.⁷⁰

In its effort to assure Congress that the military aid was working—and thus that local, not US, troops would contain insurgency—the Administration frequently provided over-optimistic reports of the capability of the Salvadoran military and of the military situation. Each summer from 1981 to 1983, US officials would talk optimistically of having turned the tide against the insurgents; and each Fall, at the end of the rainy season, the insurgents would be back in force. In August 1984 General Paul Gorman testified that up to 90 per cent of the Salvadoran countryside would be under Army control in two years.⁷¹ Other officials claimed the same month that the military stalemate in El Salvador had been broken in favour of the military.⁷² Yet, as a February 1985 Congressional study concluded:

The situation on the ground does not appear to offer as optimistic an assessment: the ratio of active forces has remained roughly four to one (Army over rebel) since 1980; the ability of the rebels to cripple the economy with attacks on power lines, dams, roads and crops has not diminished; and the rebels continue to be able to mass, attack military targets at times and places of their choosing, and disperse safely.⁷³

On the other hand, when it has been convenient for the Administration to portray the military situation as deteriorating in order to get more aid out of Congress, it has also been willing to play with the facts. In 1984, it sought \$93 million in supplemental military aid for El Salvador claiming that a dire 'emergency' existed: 'Without these funds, the El Salvadoran Armed Forces will either go back to the barracks or collapse.' The Salvadorans are 'running out of supplies right now', claimed Secretary of State Shultz; soldiers were going into battle with 'one clip' of ammunition for their rifles, claimed President Reagan.⁷⁴ But in fact there was no emergency. According to data 'supplied by the Defense Security Assistance Agency (DSAA), there was \$32 million of military aid available in the pipeline, much of which could have been

⁷⁰ Jim Leach *et al.* (1985) *op. cit.*, pp 5–6. This report also cites specific examples.

⁷³ Jim Leach, *et al.*, *op. cit.*, (1985) pp 3, 4.

⁷⁴ *Ibid.*, p 4

diverted to arms and ammunition if necessary.⁷⁵ Further, the majority of the supplemental aid that was approved was used not to resupply existing units but to continue to expand the Army by building new units.⁷⁶

Nicaragua as totalitarian In the vision of Containment Militarism, left was totalitarian, and any evidence to the contrary—and there was considerable such evidence—was dangerous given the Administration effort to rally the American people to support a military struggle. ‘The Nicaraguan people are trapped in a totalitarian dungeon’, said President Reagan in July 1984.⁷⁷ For many in the Administration such ‘totalitarianism’ followed deductively, rather than empirically, from the Marxist ideology of Sandinista leaders and the assumption of Soviet domination. As the President put it in February 1985: ‘Functioning as a satellite of the Soviet Union and Cuba, they [the new Sandinista Government] moved quickly to suppress internal dissent, clamp down on a free press, persecute the church.’⁷⁸

The Administration’s vision distorted the complexity of Nicaraguan reality. Moreover, the political urgency of legitimising a policy of force against Nicaragua led to further lying and deception. There is a core of fact around which the Administration has spun its tapestry. Many independent observers have corroborated the Americas Watch 1985 report which documents

abuses such as restrictions on expression and association; denials of due process of law in many cases in which defendants have been accused of security-related crimes; the government’s failure to acknowledge detentions promptly and the relationship of that failure to other abuses against detainees; the mistreatment of prisoners; the violent abuses against the Miskito Indian minority that took place in late 1981 and 1982; and the abuses that have accompanied forcible relocation of thousands of Nicaraguans from war zones.⁷⁹

But Americas Watch and other observers also point out that ‘US officials have built an edifice of innuendo and exaggeration’ on this core of fact. For example,

In Nicaragua there is no systematic practice of forced disappearances, extrajudicial killings or torture—as has been the case with the ‘friendly’ armed

⁷⁹ Americas Watch, *Human Rights in Nicaragua, Reagan, Rhetoric and Reality*, July 1985, p. 7

forces of El Salvador. While prior censorship has been imposed by emergency legislation, debate on major social and political questions is robust, outspoken, even often strident. The November 1984 elections, though deficient, were a democratic advance over the past five decades of Nicaraguan history and compared favourably with those of El Salvador, Guatemala and do not suffer significantly by comparison with those of Honduras, Mexico or Panama . . .

The Catholic Church and several Protestant denominations not only operate independently in Nicaragua but they are outspoken in expressing their views on religious matters and also on every conceivable secular issue; similarly, business and professional associations and labor unions are not only independent but are unhesitatingly critical of the Government and its leaders. Political parties representing a wide spectrum of views not only operate, but have elected representatives who debate issues in the Constituent Assembly.⁸⁰

The use of epithets like 'totalitarian', concludes Americas Watch, prejudice public debate through distortion.⁸¹

Human Rights This distortion of the character of the regime in Nicaragua had its mirror image in the playing down of human rights violations by those anti-communists whom the strategic vision defined as friends: the Guatemalan and Salvadoran militaries and the 'contras'.

One dramatic instance came in February 1985 when Assistant Secretary of State Elliot Abrams flatly denied that two well-documented massacres in El Salvador (in Los Llanitos and at the Gualsinga River) had taken place.⁸² Such lying was consistent with an overall pattern of Administration distortion that was particularly noticeable during the certification process in 1982 and 1983. Time and again expert witnesses challenged Administration human rights reporting. In 1985, Americas Watch concluded that 'the methodology employed by the US Embassy in tabulating human rights abuses and reporting to the Department of State provides a false and misleading picture to policymakers in the Reagan Administration about the actual human rights situation.'⁸³ For example: 'According to the Embassy, there were only five victims in the 'Possibly Far Right' category and none in the 'Far Right' category from January 1 to March 15 1985. During the same period, Tutela Legal tabulated some 34 death squad killings, including those reported by the Embassy.'⁸⁴

⁸³ Americas Watch, *The Continuing Terror*, September 1985, p 4.

⁸⁴ *Ibid.*, p 132.

The Administration has also denied the existence of an intensified air-war on non-military civilian targets, aimed at driving civilians out of insurgent zones. In August 1984, for example, Assistant Secretary of State Langhorne Motley denied 'indiscriminate' bombing and asserted that Salvadoran pilots have developed 'nearly surgical precision' in their bombing.⁸⁵ Reports from the media and independent monitors support the Americas Watch August 1984 conclusion that '... the evidence is overwhelming that armed forces continue to regularly engage in indiscriminate attacks on civilians ...'.⁸⁶

This same pattern was clear in other cases. In Guatemala, the Administration failed to condemn the gross violations by the three generals that were President—Romeo Lucas Gardia (July 1978 to March 1982), Efraín Ríos Montt (March 1982 to August 1983) and Oscar Humberto Mejía Victores (August 1983 to January 1986)—while each in turn held office. At times it even praised their human rights record. In December 1982, for example, President Reagan praised President Ríos Montt as 'a man of great personal integrity and commitment' who 'wants to improve the quality of life for all Guatemalans and to promote social justice' and is 'totally committed to democracy'. The General, he said, was getting 'a bum rap' by critics.⁸⁷ In July 1982, Amnesty International had reported that within the previous three months, some 20,000 to 30,000 Guatemalans had fled across the border into southern Mexico. Further, more than 2,600 Guatemalan civilians had been killed in over one hundred separate massacres in the last six months of 1982.⁸⁸ After each President was removed, however, the State Department itself 'condemned his human rights record for the purpose of favorably comparing his successor to what went before'—usually in an effort to get Congressional backing for loans or aid.⁸⁹

The same pattern can be found in Nicaragua: at the same time that the Administration exaggerated charges of human rights abuses on the part of the Sandinistas, it has played down or ignored the abuses of the 'contras'. Responding to reports of 'contra' human rights abuses, the President asserted:

The truth is, there are atrocities going on in Nicaragua. But they are largely the work of the institutionalized cruelty of the Sandinista government—cruelty that

is the natural expression of a Communist government, a cruelty that flows naturally from the heart of totalitarianism.⁹⁰

Americas Watch concludes its 1985 study giving evidence that the *contras* have systematically engaged in the killing of prisoners and the unarmed, including medical and relief personnel; selective attacks on civilians and indiscriminate attacks; torture and other outrages against personal dignity; and the kidnappings and harassment of refugees. We find that the most violent abuses of human rights in Nicaragua today are being committed by the *contras*, and that the Reagan Administration's policy of support for the *contras* is, therefore, a policy clearly inimical to human rights.⁹¹

Electoralism vs democracy One of the Administration's key efforts to legitimise policy here at home was to encourage elections in Central America that could be used as evidence that those we supported were really progressing in the direction demanded by moderates and human rights advocates. But in order to make reality fit the image, that meant that the undemocratic conditions for elections in places like El Salvador had to be minimised, and in places like Nicaragua had to be dramatised. Indeed, a senior US official in Central America explained that 'The United States is not obliged to apply the same standard of judgement to a country whose government is avowedly hostile to the US as for a country, like El Salvador, where it is not. The people [the Sandinistas] could bring about a situation in Central America which could pose a threat to US security. That allows us to change our yardstick.'⁹²

Duplicity on negotiations A strict interpretation of Containment Militarism as applied to Central America would rule out any negotiations with leftist forces (such as the FMLN in El Salvador) or with the Sandinistas in Nicaragua if the aim of such negotiations were to accept the legitimacy of power-sharing or the continued existence of communist regimes in the region. Containment Militarism, particularly as interpreted by those who occupied key policy positions in Central American policy formulation, was committed to rolling back the communists and destroying them militarily. Such communists, by definition, can not be trusted to keep agreements, and to do so would be

⁹⁰ 'Reagan campaigns for Latin package', *New York Times*, 16 April 1985.

⁹¹ *Human Rights in Nicaragua*, *op. cit.*, p. 16; for detailed discussion of evidence see pp 71-88.

⁹² Cited in *The Electoral Process in Nicaragua: Domestic and International Influences*, The Report of the Latin American Studies Association Delegation to Observe the Nicaraguan General Election of 4 November 1984, p. 32.

naive and dangerous. Elliot Abrams, Assistant Secretary of State for Latin America, explained:

It is preposterous to think we could sign a deal with the Sandinistas to meet our foreign policy concerns and expect it to be kept.

If, say, three months after such an agreement, the contras were disbanded, the guerrillas would begin to re-infiltrate into El Salvador within a month. What could we do about it then? Send in the marines? One thing this Administration agrees on is that we are not going to sign a phony agreement.⁹³

Another senior Administration official explained in August 1985: 'I think there is interagency agreement on Nicaragua policy now. The prevailing view in the Administration is that you cannot negotiate a deal with Communists that is based on good will or trust. You could negotiate only on the basis of a correlation of forces.'⁹⁴

Despite this view, however, the pressures from the Contadora countries and from moderates in Congress to find a diplomatic solution to regional tensions convinced the Administration that entering into negotiations was a necessary condition for legitimating its policy and getting continued Congressional support at home. Yet built into the reluctant agreement to negotiate was a certain duplicity and deception: the only thing the Administration was willing to negotiate in El Salvador was the graceful surrender of the insurgents, and its primary demand in Nicaragua was that the Sandinistas negotiate themselves out of power. This meant not only hypocrisy (no power-sharing in El Salvador; only power-sharing in Nicaragua), but a great deal of dishonesty and deception about the negotiating process itself.

Quelling dissent: Red-baiting and intimidation

Given the underlying vision guiding policy, it is not surprising that when dissent and opposition threatened policy goals, the dissenters would be seen as threatening national security. The administration, while anxious not to deny publicly the First Amendment rights to free speech, sought to undermine the legitimacy of the dissenters—and set limits on such free speech—by returning to some of the tactics of the Vietnam–Watergate period.

One troubling pattern was the effort to de-legitimise opposition through 'Red-baiting' and McCarthyism. Such efforts surfaced, as we

⁹³ *New York Times*, 18 August 1985.

⁹⁴ *Ibid.*

might expect, when the Administration faced a serious struggle in Congress.⁹⁵ They reached their height in the struggle over military aid for the 'contras' in early 1986. The messianic character of the struggle was clear. In his weekly radio speech on 8 March President Reagan declared: 'Nicaragua is a country held captive by a cruel clique of deeply committed Communists at war with God and man. How can Congress ignore this storm, gathering so close to our homeland?'⁹⁶

Given the doctrine's definition of the Nicaraguans as dominated by the forces of evil, and posing a vital security threat to the United States, the stiff opposition to the Administration's request for \$100 million in military aid, was seen as anti-American. The White House unleashed a fierce campaign to de-legitimise the opposition.

The Administration claimed it had evidence of a Sandinista 'disinformation campaign' described by Press Secretary Larry Speaks as a 'very sophisticated, very carefully drawn plan that might be titled: "How to influence the United States Congress against providing additional aid for the opposition, in Nicaragua"'.⁹⁷ Because the Sandinistas were anxious to convince Americans not to vote for the aid, the Administration implied that anyone who argued against the aid package was either a dupe of the Sandinistas or treacherously un-American. But the attack was more than implicit. Patrick J Buchanan, the White House communications director, wrote: 'With the vote on contra aid, the Democratic party will reveal whether it stands with Ronald Reagan and the resistance—or Daniel Ortega and the Communists.'⁹⁸ The President declared that a legislative defeat on the issue would prove disastrous:

⁹⁵ Faced with opposition to his Central American policies in March 1981, the President blamed his foreign-policy problems on a worldwide conspiracy.

We have to recognize that the campaign against what we're doing, the helping of El Salvador, is a pretty concerted and well-orchestrated thing . . . [It has] been worldwide. And you find the same slogans being used in demonstrations in European countries about the United States in El Salvador. You find it here.

Cited in Walter LaFeber, *Inevitable Revolutions*, New York: W W Norton, 1984, p 276.

In 1983, when Congress moved to cut Reagan's arms requests, Fred Ikle charged that Congressmen were trying to 'wash their hands of Central America like Pontius Pilate' *Washington Post*, 9 March 1984. The White House propaganda campaign at this time compared Soviet actions in Latin America to Hitler's conquering of Europe. President Reagan reiterated his charge that the Sandinistas 'engaged in anti-Semitic acts' despite the fact that Ambassador Quainton himself had warned months before of the lack of evidence. (Cited in LaFeber, *Inevitable Revolutions*, p 309.)

⁹⁶ Bernard Weinraub, 'Reagan aides open compromise talks on aiding contras', *New York Times*, 9 March 1986.

⁹⁷ Gerald M Boyd, 'Nicaragua lying, Reagan declares', *New York Times*, 20 February 1986.

⁹⁸ The article, appearing on the *Washington Post's* Op Ed page, was cited in Steven V Roberts, '2 House units bar contra aid plan and one backs it', *New York Times*, 7 March 1986.

But if the members of Congress hide their heads in the sand and pretend the strategic threat in Nicaragua will go away, they are courting disaster and history will hold them accountable . . . If we don't want to see the map of Central America covered in a sea of red, eventually lapping at our own borders, we must act now.⁹⁹

Although the rhetoric backfired—the red-baiting drew criticism from members of both parties: ‘the moral equivalent of McCarthyism’, said Representative Michael D Barnes (Democrat–Maryland); ‘simplistic reasoning and highly offensive,’ said Senator Nancy Kassebaum (Republican–Kansas)¹⁰⁰—such tactics were only modified because of political expediency. What is important to see is the way in which the need to legitimate a dogmatic policy, considered dangerous, unrealistic, and immoral by many Americans, led to the use of McCarthyite tactics. On occasion they have been effective in stifling critics. In May 1986, Assistant Secretary of State for Inter-American Affairs, Elliott Abrams, refused to speak at Harvard University's Public Affairs Forum unless the invitation given to the former US Ambassador to El Salvador, Robert White, was retracted and he was removed from the programme. Harvard then withdrew its invitation to Ambassador White and replaced him with another speaker acceptable to Secretary Abrams. Not only did the Secretary exercise pressure in threatening not to speak, but through his press secretary, Greg Lagana, he sought to denigrate Ambassador White's capacity and legitimacy as a critic. The press secretary claimed that they took the action because for Secretary Abrams to have appeared with White ‘would be a waste of time. White's views have become discredited . . . and he's becoming something of a crank.’¹⁰¹ If the environment continues to change in this direction, such tactics might be even more successful and more damaging to democratic processes.

The efforts of the Reagan Administration to quell dissent go beyond ‘Red-baiting’. Perhaps most ominous is the evidence of a return to domestic political surveillance. The danger was already clear in the executive order that President Reagan signed on 4 December 1981, authorising the CIA, for the first time in US history, to conduct general surveillance of anyone inside the US who may be in possession of

⁹⁹ Bernard Weinraub, ‘Reagan steps up his drive to give \$100 million to Nicaraguan rebels’, *New York Times*, 6 March 1986.

¹⁰¹ *The Columbia Record*, 13 May 1986.

'significant foreign intelligence' such as academics, journalists or businessmen returning from trips overseas. It also authorised the CIA to conduct undefined covert operations in the United States so long as they are not 'intended' to influence 'the political process, public opinion, policies or the media'. The FBI was given expanded authority to gather 'positive intelligence' (i.e. information about foreign countries) from Americans at the request of the National Security Council and the Director of Central Intelligence.¹⁰²

While the full extent of domestic political surveillance is not known, the FBI has questioned persons travelling to and from Nicaragua or associated with groups opposed to US policy in Central America. FBI agents have seized and copied documents of persons returning from Nicaragua. Although the FBI Director, William Webster, when questioned before a House of Representatives Committee, disavowed any political motive, some observers have argued that the pattern of FBI questioning—talking only to opponents of Administration policy, for example—indicates that 'the real purpose is political harassment' and the stifling of dissent.¹⁰³ One analyst, citing numerous examples, suggested:

it appears that a broad campaign of intimidation and snooping is in full swing, unsupported by any plausible counter-intelligence rationale. Groups as well as individuals have been systematically targeted, not merely by the FBI but by a batch of Federal agencies, including the Customs Service . . . the International Revenue Service, the Postal Service, the Secret Services and the D.I.S. [Defense Investigative Service].¹⁰⁴

There is also evidence of harassment of groups involved in the sanctuary programme to aid Central American refugees. *Time* reported, for example,

By now, the pattern is familiar: desks are rifled, file cabinets searched, records apparently stolen or photocopied. Money and expensive equipment are usually left untouched. In six cities during the past 14 months, groups providing support and sanctuary for Central American refugees have been hit by burglaries, suggesting an organized campaign of harassment.¹⁰⁵

Further, the government has placed investigators with secret recording devices in churches that help refugees, or are thinking about doing it. Theologian Harvey Cox wrote:

We are glad that other churches have brought a suit asking the Government to forbid all this as a violation of the Constitution. One minister says his parishioners now glance around uneasily when they come into his study for pastoral counselling. Another says his people are getting wary and 'do not readily reach out and include strangers' anymore.¹⁰⁶

Conclusion

The lessons of Vietnam are as varied as those who recount them. Regardless of the particular lessons people derive from the Southeast Asian conflict and Watergate, for many they represented a watershed in democratic practice. The fears of an ever-growing imperial Presidency were to be put to rest as Congress reasserted itself and broad segments of the citizenry were empowered by new social mechanisms and a new determination to play a more active role in the formulation of policy, and especially in holding leadership accountable. The hope was that democratic institutions, practices and values were once and for all being set in concrete. The strengthening of democracy was in process and many believed that the twin traumas of Vietnam and Watergate, along with the hard-fought gains of civil rights movements, would guarantee the necessary vigilance to keep the US from slipping back into the old patterns.

Yet, in little more than a decade another divisive foreign policy issue arose to test the tenacity of the reforms and the renewed commitment to democratic practice. As we have shown in this article, these high hopes have begun to evaporate in the torrid heat of revolution, insurgency and generalised conflict in Central America.

We have chosen to examine only a small area of democratic practice as it relates to foreign policy. We have looked in some detail at issues regarding the accountability of the system: the availability of accurate and timely information; and the encouragement of evaluation, debate and collective policy determination within the context of an informed citizenry and an active, effective Congress. The evidence is compelling. Regarding the formulation and conduct of foreign policy toward Central America, we have found unwarranted secrecy; circumvention

¹⁰⁶ Harvey Cox, 'The spy in the pew', *New York Times*, 3 March 1986

and violation of the law; serious distortions and dishonesty; and the active discouragement of criticism and dissent. The latter efforts displayed through attempts to muzzle and discredit critics by casting aspersions on their motives and their patriotism; by seeking to belittle, denigrate or ignore their evidence and abilities; and through intimidation.

The crucial question this all poses for us is why do we find this pattern of a strengthening imperial Presidency in the face of what appeared to be a major societal effort to reduce its effects. To assume that this pattern is either an aberration or an artifact of the Reagan Administration may lead some to a sense of comfort, for it suggests that reversal could be just around the corner in the next Administration. But the evidence suggests otherwise. What distinguishes the Reagan Administration from earlier post-World War II Administrations is more a matter of degree than one of kind. This Administration has moved the country on a fast track, but the line has been heading in the same direction for some time. The combination of the structural organisation of the foreign policy process, especially in regard to issues of national security—which seem to be subsuming more and more of all the others—and the vision which guides US policy have made it understandable, if not desirable, that Administrations would seek to increase their control over the system, even though that means doing so at the cost of diminishing democratic practices, institutions and values.

Oil markets and the developing countries

The rise, rise and then fall of oil prices during the last fifteen years has been a major influence upon developing countries. Oil-producing countries have received a windfall in income, offering them new development opportunities, while non-oil developing countries have endured a major rise in import costs. Now with oil prices plunging it is the oil producers who face financial stringency and the consumers who enjoy a windfall saving. Countries' whole energy programmes have to be reassessed in terms of both reducing energy consumption and increasing (and now cancelling) oil exploration. Oil producers must come to terms with lower income per head for their population and the political and economic consequences of lower income expectations for the future.

This article addresses the subject in three ways. First, an analysis of OPEC and Saudi Arabian strategy seeks to explain why the price has now plunged after OPEC apparently had the world in its control for fifteen years. Secondly, the impact of lower oil prices on both consuming and producing countries is assessed, against the scenarios of both \$10 per barrel and \$15 per barrel. And thirdly, the outlook for oil prices and thus for LDC finances is addressed.

Why the oil price fell

The real oil price

The history of the past thirty years shows a sharp division of oil price trends into two very distinct periods. First, in the years up until the first oil price increase of 1973 the price was declining steadily in real terms (see Figure 1). In 1986 prices the oil price reached a low of \$3.4 per barrel by the end of the 1960s, more than half the level of the late 1950s.

1972-3 saw the end of the era of cheap oil. In a dramatic fashion the real price of oil jumped, in today's prices, up to \$20 per barrel. At its peak during the subsequent thirteen years the oil price reached \$40 per barrel after the second oil price rise of 1979, with many forecasters expecting it to continue higher, even to \$100 per barrel. By 1984

Real Oil Prices

Figure 1

Source: AMEX Bank Review, March 1986.

however the writing was on the wall and the price has subsequently crashed, having traded in single figures in 1986.

During the last thirty years oil prices have averaged just below \$15 per barrel in today's dollars: while this is a fairly meaningless statistic in itself it reflects that the price now (mid-1986) is poised delicately between these two periods of cheap oil and expensive oil. At \$15 it is also worth noting that in terms of the long-term trend, oil prices are relatively higher than most other commodities, which themselves are now often 40 per cent below their thirty-year long-run average prices. However oil prices at \$10 or below begin to look as depressed as non-oil commodity prices.

OPEC's lost sales

Why did OPEC power fall so dramatically in terms of being able to control the price? Essentially, OPEC lost market share and demand for oil itself slowed in the face of high prices. OPEC priced itself out of its market, and its product out of the energy market. Figure 2 on OPEC's 'lost sales' demonstrates vividly what has happened to OPEC since 1973. In 1973 demand for oil in the OECD countries was rising faster than their GNP, as oil increasingly captured a higher share of the energy market and as energy conservation was low. Demand for energy in general was increasing approximately at a one-to-one ratio with GNP growth.

If this era of cheap oil had persisted we might postulate that demand for oil could have continued at least in line with the growth of the world economy. On that basis if OPEC had increased its sales in line with this demand its total output could have risen from just over 30 million barrels per day in 1973 to over 40 million barrels per day today. Whether or not it could have met this demand fully is difficult to answer given the events of the last dozen years but it is highly likely that OPEC countries could have increased their output substantially.

In the event the first rise in the price of oil tended to slow oil demand somewhat and also encouraged exploration and development by consuming countries of alternative oil and alternative energy sources. Though OPEC was able to maintain output at just over 30 million barrels per day right through to 1979, OPEC began to lose some market share. If the group had maintained its market share up until 1979, its output would have been around 35 million barrels per day, only slightly below the potential demand indicated by world GNP increases. After

the first oil price increase, therefore, OPEC's main problem was loss of market share rather than a major fall in total world demand for oil.

In the six years after the second oil price rise the market picture changed dramatically for OPEC. The new rise in oil prices encouraged consumers to redouble their efforts at conservation and further stimulated new exploration and development of high-cost energy sources. Simultaneously, the fruits of investment since 1973 began to come on stream, in particular North Sea oil production and that of Mexico. The desire by many consuming countries to ensure they would never be subject to an oil embargo by OPEC in future years was, throughout this period, a major stimulus to develop alternative and indigenous energy sources. At the same time, countries such as Brazil pursued their own energy programme, even at high cost, in order to satisfy the strategic objective of producing energy domestically, as well as saving foreign exchange.

Thus, the second oil price increase began seriously to depress total world demand for oil as energy conservation and the switch away from oil to other energy sources gathered pace. If OPEC had maintained its market share, that stagnant global market for oil would have still meant production of just 30 million barrels per day. This, of course, would have been no worse than in 1973 but then competition from other oil producers took away a further 14 to 15 million barrels per day from OPEC. Overall, as Figure 2 suggests, the gap now between OPEC's

OPEC's Lost Sales

Figure 2

Source: AMEX Bank Review, March 1986.

current output of well below 20 million barrels per day and that of its potential output of over 40 million barrels per day is explained by a zero growth in total demand for oil in general and a large decline in OPEC's market share.

Saudi Arabia's 1985 decision

By 1983 the prospects were getting no better for OPEC. By 1984 and 1985 demand for OPEC oil was still sluggish despite the boom of the US economy and the general worldwide economic recovery. Most importantly OPEC's swing producer, Saudi Arabia, was having to reduce output more and more and at one time was reported to be producing less than 2 million barrels per day. It was no longer fanciful at that point to consider whether Saudi Arabia might even become the first non-oil producing member of OPEC if the trend had continued! Even the continued loss of output from Iran and Iraq due to the war between them was failing to make any difference in OPEC's favour, partly due to Saudi Arabia itself producing oil for Iraq as part of its assistance programme.

By 1985, therefore, Saudi Arabia had to make an important strategic decision. The valuable pool of foreign investments built up in the previous fifteen years was under threat. Foreign investments totalling \$150 billion had fallen dramatically to around \$100 billion and a considerable portion of these investments were not particularly liquid (for example, Saudi Arabia has lent considerable amounts to other developing countries). It is likely that by early 1985 its truly liquid reserves, which it might consider available for financing the balance-of-payments deficit, were probably little more than \$50 billion. With an annual balance-of-payments and budget deficit of between \$20 and \$25 billion the prospect was that Saudi Arabia's liquid investments would have all but disappeared by the end of 1987.

For a long time Saudi Arabia was able to live with the lower oil prices by both reducing its investments and by cutting expenditures. By 1985, however, its ability to cut expenditure was beginning to reach a critical floor. The Government's budget had already been cut by one-third, from spending of \$84 billion in 1981 down to \$55 billion in 1985. Further cuts would have meant Saudi Arabia would have been spending less than before the second oil price increase (see Table 1).

For countries with a much lower income per head, the idea that Saudi Arabia could not cut back spending when its income per head was still \$12,000 hardly seemed reasonable. Furthermore, it was often argued

Table 1: Saudi Arabian Budget 1978-85

Fiscal years ²	Revenue ¹		Expenditure ¹		Balance \$ bn ³
	\$ bn ³	% change on year	\$ bn ³	% change on year	
1978	38.38	+3.7	43.52	+11.3	-5.14
1979	62.86	+63.8	56.06	+28.8	+6.80
1980	104.53	+66.3	71.04	+26.7	+33.49
1981	108.88	+4.2	84.22	+18.6	+24.66

that Saudi Arabia was able to reduce spending easily because the bulk of infrastructure investment had been carried out. Thus, its spending pattern should have passed a natural peak.

However, though the infrastructure investments have been largely completed and new plans can be delayed or cancelled, the maintenance costs are only just beginning to increase rapidly. The country now has to staff, supply, maintain and generally spend money on its infrastructure. Hence, further spending cuts are difficult to find. Saudi Arabia has become, in the standard parlance, a 'higher' if not a 'high absorbing' country. The domestic economic squeeze has been leading to substantial bankruptcies and credit problems throughout the Kingdom. Whilst poorer OPEC countries may argue that a rich country could make further sacrifices, for a country sitting on the world's largest supply of cheap oil reserves, the prospect of going through major austerity and political and economic strains would seem to be an unnecessary hardship.

Thus, by 1985 Saudi Arabia was in a box. Expenditures could no longer be cut, the country could no longer continue to run a large deficit, and revenues were still falling as oil sales declined and the price itself was pointing downwards. The only solution for Saudi Arabia was therefore either to engineer an oil price increase (by then out of the question) or to increase production. The latter course would threaten

the whole OPEC production sharing arrangements. Any other producer that wished to increase sales would then be at liberty to do so.

The final option for Saudi Arabia would have been to do nothing, and to hope that somehow demand might increase. But this looked a more and more forlorn hope, even with a more buoyant world economy, and hence by September 1985 Saudi Arabia took the strategic decision to increase production at least to its agreed OPEC quota of 4.3 million barrels per day.

Predictably the Saudi Arabian change of strategy caused a revolution in the oil markets. The oil price plunged to the low levels where it is today. To achieve its oil income objective of some \$40 billion p.a. (some \$15 billion comes in from non-oil sources including investment receipts), Saudi Arabia eventually needs to get its sales back to 7–8 million barrels per day (mbpd) if oil prices stay around \$15 per barrel. In order to be no worse off than it was prior to its shift of strategy, and if prices stay at \$15, output must reach 5 mbpd. If oil prices plunge to \$10 per barrel then output would have to go up to the 7–8 mbpd range just to be no worse off than in 1985 (see Table 2). The latter target would be

Table 2: Saudi Arabia's oil revenue calculations

US\$ billion	US\$ Price per barrel				
	5	10	15	20	25
Output mbpd					
2	3.7	7.3	11.0	14.6	18.3
3	5.5	11.0	16.4	21.9	27.4
4	7.3	14.6	21.9	29.2	36.5
5	9.1	18.3	27.4	36.5	45.6
6	11.0	21.9	32.9	43.8	54.8
7	12.8	25.6	38.3	51.1	63.9
8	14.6	29.2	43.8	58.4	73.0

Source: AMEX Bank Review, March 1986.

extremely ambitious and thus at a low price Saudi Arabia is likely to end up with less income than it would have had if it had not changed its strategy. At that point the country has to hope that the strategy does work in the long term in terms of restoring demand for oil and allowing Saudi Arabia to sell oil at this high level. If the price could be engineered in some way back to \$20 per barrel then Saudi Arabia could live with output of around 4 mbpd. But this would still leave it with the \$20–\$25 billion losses which it eventually has to largely eliminate. Realistically

Saudi Arabia may be no better off in the short run, and hence currency devaluation and austerity measures have not been averted. But in the longer run the country was on a downward slide of production if oil had stayed at 2 mbpd or even less. Something had to be done.

The impact on the Third World

The prospect of oil prices staying depressed reduces oil exporters' income prospects as well as leading to significant savings for oil consuming countries. Table 3 measures the impact on major oil producers of a price of \$15 and a price of \$10 per barrel.

Cost to oil producers

Indebted oil producers' do gain some offset to the oil loss from the potential falls in interest costs on foreign debt. The lower level of oil prices brings down the general level of world inflation and thereby should lower the nominal level of interest rates. Roughly speaking, a fall in the price of oil to \$15 should in itself have led to a 1.5 per cent fall in the level of dollar interest rates, and a fall to \$10 per barrel can be assumed to encourage a 2 per cent fall in total. In practice as oil prices have fallen during 1986, dollar interest rates have also been declining by such levels.

The largest single losers in terms of dollars, are Mexico, Nigeria, Venezuela and Algeria, losing between \$4 and \$6 billion at a \$15 oil price and losing by \$5-9 billion if the oil price falls to \$10 per barrel over a one year period.

The reduction in the interest burden changes some of these figures significantly. In particular, highly indebted Mexico gains almost \$1.5 billion if interest rates fall by 1.5 per cent and almost \$2 billion if interest rates fall by 2 per cent in total. Nigeria, in contrast, has less of an offset from lower interest rates as its debts are considerably less than those for Mexico. For Venezuela, roughly 10 per cent of the oil income loss is offset by the lower level of interest rates.

The impact of these lower earnings can be judged in a number of ways. Table 3 analyses the impact as the percentage of countries' current account proceeds, and of levels of imports. The impact on debt service ratios is also important (see Table 4), as is the availability of foreign exchange reserves to cushion the country against the immediate losses (see Table 5).

The countries in Table 3 are ranked in terms of the loss as a

percentage of current account and receipts, and hence Nigeria's losses, as high as 56 per cent of earnings at a \$10 price, stand out ahead of the field, while most other countries lose at least one-third of their earnings at this price level. Mexico's losses, at one-quarter of foreign currency income, are somewhat less in comparative terms as the country relies less on oil for foreign exchange than do countries such as Nigeria.

In terms of the required cut in imports to fully offset the lower income, the numbers are more dramatic. For example, at a \$10 price

even with the interest saving Venezuela would have to stop importing altogether, if this extreme route were taken. In practice it raises the possibility that Venezuela may need to seek new finance from lenders, a hitherto absent need, which allowed the country to avoid applying for IMF loans. For countries already undergoing austerity this required cut in imports is the most forceful demonstration of the impact of the income loss. Equally it shows that for countries such as Indonesia, whilst still an oil-dependent country, the income loss as a percentage of imports is significantly less than for most other oil producing countries. The country of course also has to continue with its austerity programme, but the sheer financial damage emerges as being considerably more muted than for Mexico, Nigeria and Venezuela.

With respect to the debt crisis the impact of these income falls can be measured best by looking at the changes in interest to earnings ratios (Table 4). This particular ratio is important as it is the ratio which a country must meet in order to keep its interest payments up to date. A great deal of principal has now been rescheduled, but banks in particular need to ensure that assets remain on a fully interest-earning basis, if they are to continue to consider new money packages, further financial support and maintaining trade credit lines.

By 1985 many oil producers' interest-to-earnings ratios had come down substantially, but were still in several cases above an interest-to-earnings ratio of 20 per cent. While there is no magic level to decide when an interest-to-earnings ratio is too high, clearly a country that is paying much more than 20 per cent out of annual income on interest alone has a substantial debt burden.

As Table 4 shows, changes in the oil price and interest level would lead to substantial changes in these ratios. First, if the interest gain is included in the calculation, in 1986 Mexico would see its ratio rise from 35.8 per cent to 42.5 per cent if oil falls to \$10 per barrel (in practice it is unlikely that throughout 1986 oil prices will average \$10 given an average level of around \$15 for the first six months). The ratio for Peru falls, as the interest gain is more significant than the overall loss of total current account income. Perhaps one of the most significant increases is that for Venezuela, with the ratio rising from just over the indicative critical level of 20 per cent, to over 30 per cent. The ratios for Indonesia and Nigeria stay relatively low.

Should the interest gain not come through or be reversed from where it is today, then the ratios look considerably worse. If interest rates rose again to 1985 levels and oil fell to \$10 per barrel, Mexico would face the

prospect of an interest to earnings ratio of over 50 per cent. Other countries' ratios rise to 30 per cent-40 per cent, and for Venezuela this would represent a doubling of the interest to earnings ratio. For the time being the ratios for 1986 are likely to be closer to the lower levels in this sensitivity analysis, with the interest gains having come through and oil probably averaging around \$15 for the calendar year. Nonetheless with oil markets weak, the impact is still likely to be substantial.

The final measure for gauging the impact of the lower price on oil-producing countries is obtained by comparing the loss with the countries' outstanding foreign exchange reserves. Where a country has substantial foreign-exchange reserves, it is able to postpone adjustment even though for all countries reserves would eventually run out if no economic adjustment to the lower income level were taken. Indonesia, with foreign exchange reserves of over \$9 billion, has a substantial cushion and in theory could afford to draw on reserves for three years, even under the worst case of a \$10 price and no gain on the interest rate side. Most other countries have much less in the way of a financial cushion.

Oil consumers' gains

While the loss of oil income spells financial danger for many oil-producing countries, the lower oil price clearly is good news for many oil-consuming countries. Table 6 measures the oil bill savings and the accompanying interest rate reductions for a number of countries. In dollar terms the largest gains are made by Brazil, which could save over \$6 billion under the best-case scenario. Such a saving would allow the country to increase imports by over 40 per cent in one year, which would be a dramatic boost to a country seeking to expand its economy. Other countries with substantial gains include Greece, Turkey, India, the Philippines and Korea.

Some of these gains will be offset where countries currently earn substantial sums from trade or service contracts with oil-producing countries. Korea and Turkey, for example, earn substantial amounts from remittances of workers and from construction fees earned in the Middle East. Of course these countries' drive to increase such earnings was part of a strategy to hedge against the impact of high oil prices. In consequence, as oil prices have fallen, the value of that hedge has also declined accordingly. The task for these countries' authorities is to ensure that those enterprises which now are on the losing side are

Table 6: Impact on oil importers of a US\$15 oil price

supported in view of the countries' overall balance-of-payments benefits.

Overall the benefits to oil-consuming countries, in terms of savings of current account receipts, is less than the damage done to oil-producing countries' earnings picture. Most countries gain somewhere between 10 per cent and 20 per cent of earnings under the best-case scenario.

compared to the much higher loss levels suffered by some producers. In practice, the benefits from lower oil prices are more widely distributed across the world, while the losses tend to be concentrated on those earning money from oil.

A number of these consuming countries will enjoy an improvement in their financial position, particularly in terms of the improvements of their debt servicing ratios (see Table 7). For example, the interest-to-earnings ratio for Brazil now has a very good change of falling below 30 per cent in 1986, the lowest level for many years. It should be noted that the calculations in Table 7 only reflect the lower interest impact for these countries, and to gain a truer comparison the lower oil bills could be added to the denominator of the ratio. On this basis Brazil's ratio would drop to 28 per cent if oil prices averaged \$10 per barrel.

Of course, the impact of lower oil prices on developing countries does not stop at the fairly straightforward calculation of oil income losses and oil bill savings. All countries will be affected by the stimulatory effect on the world economy of low oil prices, and in many cases the end of the oil boom could lead to structural improvements in some countries. For example, the non-oil economy of a country such as Nigeria has suffered considerably in the last fifteen years. The over-valued naira,

for example, has forced many domestic producers into difficult positions. Nigeria has now become a net food importer. Non-oil exports are extremely small. In the short run, currency devaluations associated with lower oil prices will not lead to a boom in non-oil exports overnight, and the most important impact is likely to be in terms of curbing imports. However, with a competitive exchange rate non-oil exports ought to be substantially higher. That Nigeria is exporting less than 5 per cent of GNP in non-oil products is a measure of how little it is tapping its potential for generating foreign exchange earnings. Meanwhile the country at one point was importing goods to the value of 31 per cent of GDP. Similarly, Mexico, when its currency has been competitive, has shown substantial gains in the non-oil economy, and there is no reason why this will not be able to happen again in future years.

The longer-term outlook for oil

A substantial fall in the oil price to even single figures cannot be ruled out under present conditions. At the same time, OPEC is continuing to attempt to support the oil price, in a price range of between \$15 and \$20 per barrel, though some would like to see a return to \$28 per barrel.

The financial equation suggests that many countries would like to see the oil price fall limited to around \$15 per barrel, and it is probably in the interests of the consumer of energy worldwide that the oil price collapse does not go too far. If oil prices do fall to lower levels for a sustained period, then it is highly likely that much of the changes in the demand for oil which have occurred since 1973 will begin to reverse themselves. Demand for energy efficient products will diminish, conservation measures are bound to lapse as companies, individuals and governments switch their concentration away from energy saving to other ways of improving productivity and their economies. Consumers will not remove existing energy conserving investments (for example, the insulation of houses), but the incentive to invest in further insulation and further energy-saving devices will fall.

In the short run, demand is unlikely to pick up dramatically unless speculative stock-building takes place, but the potential for a rise in demand if the era of cheap oil seems to be returning must not be underestimated.

If the low oil price continues, then the risk for the consumer countries is that at a future date an oil cartel will be possible once more. While

those in favour of pure market forces would not suggest that this possibility warrants intervention in the market, it is important to recognise that the oil market is hardly free worldwide. Oil is distributed extremely unevenly, with Middle East countries having the largest supply of cheap oil, and industrial countries having potentially large supply, but at higher production costs. Oil and energy is a unique input into the production process (whether in industry, agriculture, or services) and all consuming countries are affected by changes in the price of energy. No country wishes to be totally dependent on imported energy, and thus, even at high prices, many production facilities and alternative energy sources will be maintained. Limiting the oil price fall to around \$15 could limit the reversal of conservation and ensure that a more stable price of energy is achieved in the longer term. This would enable countries to plan their spending patterns more easily, and protect oil-producing countries from the impact of volatile earnings streams.

But can market stability be restored, assuming that to be desirable? At present there is no group of producers both willing and able to control the price through production agreements. The advent of active spot trading rules out easy price intervention by a few producers. Industrial countries at present are enjoying the price falls, even though the UK and US economies have to bear some costs in terms of problems in the energy sector (US) and lost government oil revenues (UK). But both the UK and the US gain as consuming countries. OPEC will undoubtedly continue to try and limit production, but it is difficult to see how a real change in the present position of massive oversupply and low demand can be achieved. Most metals producers will provide evidence of how a market can suffer a major price depression after a period of massive investment stimulated by a high price for the product. Consequently, oil-producing developing countries must now adjust to lower income prospects, while consumers can welcome the gains.

Rainbow Warrior: nuclear war in the Pacific

ate on the night of 10 July 1985, the Greenpeace flagship *Rainbow Warrior* lay at her berth at Marsden Wharf in Auckland Harbour. Her crew were resting from preparations for a protest voyage to the French nuclear testing site at Moruroa Atoll, in eastern French Polynesia. Ten minutes before midnight, two explosions rocked the ship, and she sank to the bottom of the harbour in less than four minutes. After abandoning ship, the crew discovered that one of their number had failed to escape. Crewman/photographer Fernando Pereira, a Dutch citizen, was trapped in his cabin below decks when the second explosion went off. The coroner listed the cause of death as drowning. Over the next few days, it would become clear that the correct word was 'murder'.

'TERRORISM STRIKES' screamed local headlines, and the South Pacific found itself bathed in the glare of international publicity. Credulity turned to outrage as the culprits turned out to be agents of the French government, highly-trained underwater saboteurs from the *Direction Générale de la Sécurité Extérieure* (DGSE), the French equivalent of the American CIA and British MI6. Although seldom used at first, the words 'state-backed terrorism' began to creep into the lexicon of journalists from around the world who flocked to Auckland and Paris to cover the story.

The drama that unfolded had all the elements of a best-selling spy thriller, replete with high-level diplomatic meetings, political scandal, nuclear intrigue, government cover-up, military strategy, submarines on secret missions, trade sanctions, and a pair of saboteurs masquerading as honeymooners. As one Auckland detective described it at the height of the investigation, 'Well, I can't tell you much, but you've heard of John le Carré? Robert Ludlum? Well, those boys could never have dreamed this one up!'

The mainstream news media in the northern hemisphere, after initial reports on the sinking, largely ignored the incident, its context and implications until it blossomed into the spy story outlined above. By that time, the scene had shifted to Paris, and *l'affaire* thickened:

vanishing agents, political scandal, rumour-mongering, the official whitewash of the Tricot Report, speculation of an 'Underwatergate' for Mitterrand. But the near-collapse of the French government in political infighting, the dismissal of the head of the DGSE, the resignation of the Defence Minister, Charles Hernu, partisan politics and backstabbing have obscured the deeper significance of the bombing of the *Rainbow Warrior*. In the context of the current political face of the South Pacific, it was just another manifestation of the pattern of coercion, economic blackmail and strong-arm tactics employed by the US and France to achieve their political and military objectives in the region.

There is growing evidence that these policies are backfiring dramatically, but the tactics appear to continue unabated. Despite the fact that the Pacific has begun to emerge on the world political scene as a region to be reckoned with, the US and France seem bound and determined to ignore regional interests and utterly isolate themselves in the area. The bombing of the *Rainbow Warrior* was simply the most dramatic expression of that fact.

Since World War II, Northern political opinion has tended to dismiss the Pacific as a backwater, or as an 'American Lake'. Travel brochures describe the 'quaint natives' of French Polynesia, who have been rescued from cultural ignominy by their introduction to French *haute cuisine* and the other 'benefits' of *Liberté, Égalité, Fraternité*. Of course, the travel brochures don't show the slums of Papeete, nor do they mention the distortion of the Tahitian economy by the French military presence with its attendant high prices (young, single French soldiers are paid extraordinarily high wages for their tours in the *Centre d'Expérimentation Pacifique*) and rampant inflation, which has disenfranchised many Tahitians. No one summed it up better than then Assistant to the President for National Security Affairs, Henry Kissinger, in 1969, when he responded to a question about US handling of its United Nations Trust Territory responsibilities in Micronesia with, 'There's only 90,000 of them out there. Who gives a damn?'¹

Today, however, Kissinger would have a hard time getting away with such a statement. A series of events in the past two years have served to highlight the utter transformation of the peaceful and idyllic image of the Pacific region. The bombing of the *Rainbow Warrior* and the murder of Fernando Pereira was not simply a senseless act, 'a third rate

¹ Walter Hickey, *Who Owns America?*, Englewood Cliffs, New Jersey: Prentice-Hall, 1971, p 208, as quoted in Donald McHenry, *Micronesia: Trust Betrayed*, Washington DC: Carnegie Endowment for International Peace, 1975, p 98.

burglary', as many have tried to characterise it. The controversy in the Pacific over American and French foreign policy and nuclear-military presence has become deadly, and deadly serious for those concerned with these issues. They have a common theme, which is that the US and France will continue to bully, coerce, and even murder to try and foist their views upon their 'allies' in the Pacific. Seven events or developments can be pointed to as exemplary of the shifting winds of South Pacific politics.

First and foremost, the 'ANZUS Row', as it is referred to in the New Zealand press. David Lange's Labour Government, with the overwhelming backing of public opinion, has upheld its election promise of barring nuclear-armed or nuclear-propelled warships from New Zealand harbours. The US has not taken kindly to this, threatening New Zealand with trade sanctions, withholding defence information, and all but accusing the New Zealanders of acting in concert with the Soviet Union. US politicians decry the 'Kiwi disease' (along with the 'Dutch disease', the 'Greek disease', and various other obviously aberrant national pestilences) which plagues the government of New Zealand and its population. Its symptom: a fundamental refusal to cooperate in the policy of nuclear deterrence. Despite all assurance to the contrary, the US has made the case that such a lack of faith in nuclear defence can only be interpreted as a threat to the solvency of the alliance itself. Although the commentary from the US Administration has been reasonably polite in public, behind closed doors the economic and political pressure on the New Zealand government has become enormous. A change of ambassador to a suave and diplomatic Reagan hard-liner, and a stepped-up US Information Agency presence in New Zealand are only the more visible part of the US effort to undermine the Lange government and its anti-nuclear policy at home.²

The escalation of the struggle in New Caledonia over French colonial rule marks a second portent of change. The more radical elements of the *caldoche* (white French settlers) have spawned a number of right-wing paramilitary organisations, led by expatriates from former French colonies in Algeria, Vanuatu and Vietnam which are locked in a

² The US policy to neither confirm nor deny the presence of nuclear weapons on its ships has nothing to do with protecting US national security, but rather is intended to quell potential anti-nuclear protests in the respective countries, like Japan and Australia, where Navy ships dock. *Jane's Fighting Ships* provides detailed information about which ships are nuclear-powered and nuclear-armed, and according to Admiral Eugene Carroll (retired) of the Center for Defense Information, both the US and USSR have the national technical means, both satellites and spies, to keep abreast of each others' navies.

struggle with the native Melanesians, the Kanaks. This struggle has grown increasingly violent in the past year and a half, and the Parisian politicians seem sweetly reasonable in comparison to the white settlers. However, the rabidly pro-French *caldoche* serve Paris' military objectives well, and the construction of a major nuclear submarine facility in Noumea proceeds apace, despite the strong objections of all nearby nations. There are few indications that the conflict will subside in the near term.

A third, relatively recent development in the region has been the heightened awareness of past abuses, especially with regard to the atmospheric nuclear testing of the US and UK. The *Rainbow Warrior's* evacuation of 304 islanders from their contaminated home atoll of Rongelap once again raised the spectre of the victims of the US nuclear testing programme of the 1940s and 1950s in the Marshall Islands. Along with the more familiar story of the Bikinians and their long search for a new home, the story of the Rongelap people's severe contamination by fallout from the infamous 'BRAVO' hydrogen bomb test in 1954 gained the Rongelapese some notoriety and some much-needed assistance from various non-governmental sources. At the same time the publicity surrounding the evacuation helped bring to light recently declassified Defense Nuclear Agency documents relating to the testing programme.³ The documents revealed, at the very least, dreadful mishandling of the UN Trusteeship by the United States; at worst, evidence that the US government has been conducting a heartless 'experiment' with unwitting human victims for the past thirty years. In the words of one US scientist 'the habitation of these people on this island [Rongelap] will afford most valuable ecological radiation data on human beings'.⁴ The story of the evacuation received little or no coverage in North America, but elsewhere in the world, the US was chided once again for its failure to live up to the terms of the UN Trusteeship agreement by which it currently holds dominion over the vast sweep of Micronesia.

Fourth, the assassination of President Haruo Remeliik of the tiny near-nation of Belau (Palau) and the subsequent installation of President Lazarus Salii, who seems bound and determined to undermine Belau's nuclear-free Constitution in favour of US nuclear

³ Defense Nuclear Agency, *Castle Series, 1954*, DNA 6035F, 1 April 1982, p 202 and throughout

⁴ Robert A Conard *et al*, *March 1957 Medical Survey of Rongelap and Utrik: People Three Years After Exposure to Radioactive Fallout*, Upton, New York: Brookhaven National Laboratory, June 1958, BNL 501, p 22.

interests, cannot go unmentioned. Despite six referenda that have upheld the non-nuclear aspects of the Belau Constitution, the new Belauan President has tried to enter into an 'administrative agreement' with the US which would somehow obviate the crystal-clear provisions of the Belau Constitution on this subject:

Harmful substances such as nuclear, chemical, gas or biological weapons intended for use in warfare, nuclear power plants, and waste materials therefrom, shall not be used, tested, stored, or disposed of within the territorial jurisdiction of Palau without the express approval of not less than three-fourths (¾) of the votes cast in a referendum submitted on this specific question.

(Belau Constitution, Article XIII, Section 6)

The traditional leaders of Belau have now taken the issue to the Belauan courts, and have severely challenged US plans to dissolve the UN Trust Territory of the Pacific Islands with all her military plans intact.

The story of the American attempt to remove the stigma of colonialism from its presence in the Pacific would fill many pages, but it is sufficient to note that the long process of dissolving the last of the eleven trusteeships formed by the United Nations after World War II has been fraught with deception, economic blackmail, ignorance and bureaucratic and diplomatic ineptitude. Although the murder of President Remeliik has never been solved, the US cannot have been sorry to see a strong yet beleaguered defendant of the nuclear-free Belauan Constitution disappear in favour of a pro-US politician. Given the unstable situation in the Philippines, Belau forms the next layer of 'defence' against the supposed menace from the East (or West, if your vantage point is in Belau). Along with the Kwajalein Missile Range in the Marshall Islands, planned US military bases in Belau are key to the future of the region from a US nuclear strategic viewpoint, as are long-established US bases at Guam, and proposes bases at Tinian and Saipan, in the Northern Marianas.

A fifth development is the increasing likelihood that Pacific nations treated callously by the West will deal with the Soviet Union instead. The tiny nation of Kiribati, formerly comprising the British colony of the Gilbert Islands and the Phoenix and Line Islands, recently signed a major fishing agreement with the USSR in exasperation over the utter disregard of her 200-mile Exclusive Economic Zone (EEZ) by US tuna fishermen. Washington's consistent refusal to do anything to upset the powerful domestic fishing lobby has resulted in the only real 'toehold'

the USSR has in the region. The recent seizure of the US tuna seiner *Jeanette Diana* in the Solomon Islands is another manifestation of this phenomenon: Pacific nations all considered that the Solomons had acted entirely within the international law when it seized the vessel, while the US response was one of economic sanctions, threats, and general bully-tactics. The net result of these situations resulted in a build-up of anti-US sentiment in the Solomons to the point that the government publicly suggested that they would invite the USSR to fish in their waters.

If one looks at the Pacific Islands in terms of land mass, the region retains its character of being wide open, and the far-flung 'micro-states', most of them newly independent and struggling economically, seem extraordinarily insignificant. However, if you draw 200-mile EEZS around these same nations, the character of the region changes dramatically. What was once a playground for naval forces and fishermen becomes a maze of territorial and economic zones, with a whole new set of legal, economic and diplomatic restrictions that the US, France and others have been able largely to ignore until now.

One of the most telling measures taken by the South Pacific nations was the signing of the South Pacific Nuclear Free Zone Treaty (the Treaty of Rarotonga) concluded in the Cook Islands at the 16th annual meeting of the South Pacific Forum on 6 August 1985, the 40th anniversary of the bombing of Hiroshima. Although US Secretary of State, George Shultz, belittled the effort by referring to 'a message in a bottle from somewhere in the South Pacific', and although it is criticised by some South Pacific nations and anti-nuclear activists as not being strong enough, the treaty is an important first step in institutionalising the region-wide sentiment that the Forum nations have no desire to be pawns of either side in the superpower confrontation. What must be more disturbing to the US is that there are indications that this sort of sentiment is spreading to the ASEAN nations as well. All of the nuclear powers have been invited to sign three Protocols to the treaty, agreeing not to test or store nuclear weapons in the region, nor to use the region for disposal of nuclear wastes. It was not surprising that the only nuclear power that showed any initial interest in the treaty was China. There have been recent indications from the Soviet Union, however, that it too is now willing to sign on.

Item seven, the leaking of a report by Robert C Kiste and R A Herr, who had been commissioned by the US State Department to look at the current situation in the Pacific. The report's conclusions stated, in a

nutshell, that the greatest enemies of Western interests in the Pacific were the foreign policies of France and the United States. After failing to suppress the report the US State Department dismissed it out of hand. Even so, its conclusions rang true in many quarters, especially when it referred to the US's 'attitudinal schizophrenia toward the South Pacific'. Although the 'Soviet threat' continues to be used by both France and the US as justification for their military build-up in the region, the report found that:

By the usual objective criteria, the South Pacific ranks as one of the most vulnerable regions in the world and yet it has perhaps the least Soviet influence of any area of the globe. Further . . . the prospect of a physical or political danger from the Soviet Union was not regarded as high. Indeed, even in circumstances where a Soviet or surrogate opportunity has arisen, these have not necessarily emerged as a consequence of Island vulnerability.

The most concrete instances of opportunity have occurred as a result of controversy which could be seen as generated by the Western nations themselves. French attitudes on decolonisation have banked up frustrations which have found outlets in Cuba and Libya. American fisheries legislation has produced conflict and stalemated solutions to an extent where even Soviet assistance has become acceptable. Ironically, there is little evidence to suggest that either the USSR or the possible Soviet surrogates had actively probed to find such opportunistic occasions for exploitation . . .⁵

The veil had been lifted for those who had not yet seen. In the Pacific, the US had 'egg on its face' once again, although at home the report elicited little notice.

Last, but not least, the controversy over continued French nuclear testing at Moruroa. Repeated and universal condemnation of the French testing programme from Pacific nations has largely fallen on deaf ears in Paris. The huge military presence in Tahiti has effectively served to divide the opposition (although there is evidence of a resurgence of late) to the point where it is limited to an annual demonstration or two. However, growing contacts with the outside world are giving this movement new life. And growing interest in France's nuclear programme, as well as in the human victims of the French test programme, from Greenpeace and other international organisations apparently provoked the act of state-sponsored terrorism which shook the Mitterand government to its roots last summer and autumn.

⁵ Robert C Kiste and R A Herr, *The Potential for Soviet Penetration of the South Pacific Islands*, commissioned by US State Department, but not officially published. December 1984, pp 66-7.

Ironically, at the recent Western summit in Tokyo, one of the main topics on the agenda was how to combat terrorism. In attendance were the Heads of Government of France, Britain and the United States, the only nations in which Greenpeace has a presence, by the way, which did not offer some sort of condolences on the terrorist bombing of the *Rainbow Warrior*. Prime Minister Thatcher was clearly caught off guard by a New Zealand reporter's query as to whether France should not be condemned for the sabotage under the terms the summit had concluded. She responded that 'the two are totally different. Anyone who confuses them . . . there is no point in wasting time on the question.'⁶ In a subsequent letter explaining the statement, the government listed the fact that the French government had admitted responsibility for the act and expressed regret at the loss of life as mitigating factors.

As a point of comparison, it is worth noting that Walter Lini of Vanuatu defended his country's opening of diplomatic relations with Libya by saying that the *only* act of state-sponsored terrorism in the Pacific in recent times was the French government's sabotage of the Greenpeace ship.

If the bombing of the *Rainbow Warrior* was designed to suppress opposition to the French nuclear test programme in the region, it was an abysmal failure.

What has caused such an uproar in this formerly docile and obsequious part of the world? With all the region's historical, cultural, religious, political and economic ties to the West, one would have thought that a modicum of diplomacy could have smoothed over the rough edges of the clash between strategic concerns from the North with 'local interests' in the Pacific. This has not been the case, however. On the contrary, the US and France find themselves fighting a nuclear 'war' in the Pacific against a most unlikely set of opponents. However, the Pacific has changed, and the US and France have not kept in step.

The Pacific's nuclear 'war' dates back to 1945—to the bombing of Hiroshima and Nagasaki, followed by the US atmospheric nuclear testing programme in the Marshall Islands from 1946 to 1958. Then British tests at Christmas Island and in the Australian outback; the beginning of the French testing programme at Moruroa in 1966; more US tests at Johnston Atoll in the early 1960s; flight testing of ICBMs, anti-satellite weapons; and now 'Star Wars' technology at the Kwajalein Missile Range in the Marshall Islands. The displacement of local

⁶ 'Bombing not terrorism' *New Zealand Herald*, 7 May 1986.

populations and adverse health effects as a result of these programmes has not been without opposition, but that opposition has been so scattered and unorganised until recently that it has been little felt in Washington and Paris. However, it has not been without a profound effect on the political orientation of the newly emerging states in the region. In the words of the Australian Ambassador to the United States, F Rawdon Dalrymple:

It should be remembered that, other than Hiroshima and Nagasaki, the Pacific Islands have been the only locations where nuclear testing has had a direct and negative impact on the inhabitants. US atmospheric testing at Bikini Atoll and Rongelap displaced the residents of those atolls and legal suits are still continuing. It is not sufficient to say that the Islanders don't understand nuclear matters—they do, and in a more personal and immediate way than most of us who have never had any first hand experience of such matters.⁷

Given this experience, it is understandable why the people in the Pacific region are so outspoken and adamant on nuclear issues. It is not a growing attachment to the Soviet bloc. Their policies are not, at least not yet, anti-Western, but anti-nuclear, and policy-makers in Washington and Paris can refuse to acknowledge this distinction only at their peril. Most people in the emerging island nations as well as their more established counterparts in Australia and New Zealand acknowledge their ties to the West, but they do not feel compelled totally to subvert their own regional interests for a conflict between East and West which they feel centres primarily on Europe and has little to do with them, other than the fact that they too will die in all-out nuclear war.

Further, they recognise that their future and development is tied much more to Asia than to Europe or North America. The US would be wise to recognise the implications of this fact in terms of their Pacific policy as well. The volume of US trade across the Pacific has recently surpassed that over the Atlantic for the first time in history. The economies of Southeast Asia, Japan and the western Pacific Rim generally are some of the most vibrant economies in the world, and major trading partners for Pacific Island nations. They are rapidly becoming the centre of primary industrial production in the global economy. They are resource rich, technological wizards, and keenly competitive. Seen in this context, the US takes on many of the

⁷ F Rawdon Dalrymple, 'Partners, Friends and Allies. Australia and the Pacific' text of speech delivered to The Asia Society/Washington Center, Washington DC, 24 September 1985, p 16

characteristics of just another decaying industrial state, whereas from the Pacific, Europe is viewed as an economic museum, collecting dust in a corner.

How then does one explain the West's continuing belief that given sufficient economic pressure and strong-arm tactics, the Pacific nations are going to 'come around'? One can only surmise that they continue because they have 'gotten away' with it in the past. Strictly speaking, that is still the case. The US seems for the moment to have 'contained' New Zealand's anti-nuclear policy, inasmuch as the Australian government has, in the interests of preserving its uranium mining industry, continued to suffer embarrassment at home over backing down on the anti-nuclear platform on which it was elected. In a one-to-one economic war with a state such as the Solomon Islands, the US is bound to win; and it will probably also maintain military hegemony over Micronesia for some time to come. France still holds on to New Caledonia, although that seems to be only a matter of time. Growing civil unrest in French Polynesia can probably be dealt with by the massive French military presence in her colony. However, the nuclear 'war' surfaces on other fronts. The US has labelled Vanuatu 'the Nicaragua of the Pacific' for Prime Minister Father Walter Lini's outspoken anti-nuclear and anti-imperialist line. Land occupations by Marshallese landowners at Kwajalein Missile Range threaten what many commentators have called the military facility 'which has contributed more to the vertical proliferation of the nuclear arms race than any other site on earth'. Japan has joined the chorus of voices which regularly condemn French nuclear tests at Moruroa. China is gently courting major trade relations with Pacific states, and at the same time is paying very serious attention to the Treaty of Rarotonga and all that it implies, including restrictions on the passage of nuclear armed or powered vessels. France and the US face another confrontation with Pacific nations over the terms of a new Convention on a South Pacific Regional Environmental Programme. Once again, the battle is over things nuclear.

For some reason policy-makers in Washington and Paris do not seem to have caught on either to the depth of popular feeling in the Pacific on nuclear issues, or to the fact that it is no longer a political backwater, disconnected from the rest of the world. Jet aircraft, international news services, and satellite telephone and video links all serve to connect journalists, activists and politicians over the vast expanses of ocean that used to keep local populations in isolation and ignorance. Dozens of

recent books, feature and documentary films, and newspaper features appearing in North America and Europe have begun to transform the image of the Pacific from the stereotype of white sandy beaches, tropical sunshine and hula girls into a more realistic view of the region. What was once a collection of satellite states attached to one Western power or another has emerged as a newly self-conscious political region that increasingly tends to act more or less as a 'bloc' in international forums, especially regarding the nuclear issue. While running roughshod over popular political opinion in the Pacific, the US and France are increasingly isolating themselves from an emerging political and moral force in the world. Nowhere is this clearer than in the case of French nuclear testing. Once again, Ambassador Dalrymple puts the case well:

the United States is seen as being less than helpful by the States of the South Pacific. And that is because the United States has tended, is seen, anyway, to have tended to side with France on the issue of nuclear testing in the South Pacific . . . I think that continued French use of Moruroa Atoll for nuclear testing is absolutely certain to prejudice the South Pacific people against the West, that is to say United States and Australian interests in a way that will quite possibly prove very costly . . . If you want the South Pacific to become an area where the Soviet Union, Cuba and others of that stripe can find fertile ground for anti-United States, anti-West propaganda and activity and in which they can develop activities directly prejudicial to our interest—then [the US should] continue with a policy of indifference to what the French are doing there.⁸

The US and France are beginning to lose their nuclear 'war' in the Pacific. The bombing of the *Rainbow Warrior* illustrated the growing frustration and paranoia exhibited by France and the US in defence of their nuclear interests much better than anything Greenpeace had planned to do.

The *Rainbow Warrior's* protest voyage to Moruroa was the last leg of a pan-Pacific tour organised by Greenpeace in an attempt to bring home to its large constituency in the North a message whose proponents in the Pacific have made into a matter of government policy, the foundation of the Treaty of Rarotonga, and which is so generally accepted at home that it is almost a non-issue. Unfortunately, the message has not yet been heard in Washington and Paris, where nuclear strategists continue to plot tactics and scenarios in this latest, and perhaps the last arena for superpower confrontation: the Pacific. The message:

⁸ Dalrymple, *op. cit.* , pp 15, 19.

If It Is Safe . . .

Test It In Paris

Dump It In Tokyo

Store It In Washington

. . . But Keep My Pacific Nuclear Free!

The politicians, newspaper columnists and pundits in Washington, Paris, and other Northern capitals continue systematically to miss the point by decrying the arrogance of these 'micro-states' for choosing not to become embroiled in the East-West confrontation, by dismissing their real concerns as a naive failure to recognise the *Realpolitik* of the age of nuclear weapons, and by miscasting opposition to nuclear weaponry as opposition to the West. There is evidence, however, that the bombing of the *Rainbow Warrior* and other significant events of the recent past in the Pacific are beginning to stir them from the ignorance which has informed American and French foreign policy in the Pacific for so long.

Lebanon: an anomalous conflict?

Now in its eleventh year, the war in Lebanon lingers on. Violence in that country goes through phases, sometimes surging for internal political reasons, sometimes as a reaction to regional or international developments, and almost always for a combination of both. For eleven years, academic analysts, the international press and even the Lebanese themselves have wavered in analysing the conflict. At times they called it a civil war, at others an international conflict pitting nation-state against nation-state. At the height of frustration, some referred to it as a superpower conspiracy aimed at undermining the stability of a peaceful but weak regime for the sake of political expediency. Even the nature of this expediency changed to fit the mood of the times. Thus, securing oil flow, the Camp David process, the wider issues of the Arab-Israeli conflict, or numerous other reasons were invoked at various times by such conspiracy-believers to explain Lebanon's torments when no other explanation was readily available.

But if there is a commonly held view of Lebanon's conflict, it is its oddity; its inability to resolve itself or indeed, the inability of mighty powers, near and far to resolve it. As a result of its unyielding nature and complexity, with a web of interlocking regional and international pressures, the Lebanese war has been increasingly dubbed as an anomalous conflict.

In fact, Lebanon's Protracted Social Conflict (PSC) is not at all an anomaly.¹ It is precisely because of its complexity, its ever-growing tendency of co-opting and internalising regional conflicts that Lebanese and others, unable to develop a coherent rationale behind the Lebanese war, have relegated it to those few, obscure, and seemingly interminable conflicts of our age.

¹ For an overall discussion of protracted social conflicts, see Edward E. Azar and Stephen Cohen, 'Peace as crisis and war as status-quo: the Arab-Israeli war environment', *International Interactions*, 6(2) 1979, pp. 159-84, and Edward E. Azar and Nadia Farah, 'The structure of inequalities and protracted social conflicts: a theoretical framework', *International Interactions*, 7(4) 1981, pp. 317-35.

As a multi-communal/developing society, Lebanon falls into a large category of emerging states that exhibit the pressures and conflicts of nation-state building. Since independence, the nation-state has been in direct competition with its antecedent, the identity group, for the loyalty of the individual. While the state did not succeed in winning the loyalty of its multiple communities, a delicate equilibrium developed between the two. When this equilibrium was maintained, as it was in Lebanon for about thirty years (with one interruption in 1958), PSC remained in its latent stage. When the equilibrium was shattered and the state weakened, the dormant inter-communal grievances, competition and hostility forged forward violently.

This paper seeks to describe the PSC of Lebanon and its implications for conflict management. It will attempt to assess the relationship between the individual and the community, and between the community and the state, and will focus on this specific relationship in order to assess the prospects of conflict management in Lebanon.

Communal identity

In the industrialised world, societies developed with class as the differentiating component within them. Indeed, class awareness appears more useful than religion, ethnicity or race in describing the role of the individual in society.

In developing, multi-communal societies, although discrepancies in wealth distribution are much more acute than in the West, class is not a very informative indicator of conflict. Cleavages based on racial, religious, ethnic or other differences are more predominant. They play an overriding role in the behaviour of the individual in society. Class dynamics, which it was once believed would homogenise developing societies by cutting across horizontal boundaries, simply lost out in their struggle with the more ascriptive and primordial nature of sub-nation-states.

In Lebanon, class participation is flexible. One may be born into a particular socio-economic class and move up or down. Particularistic affiliation, on the other hand, is rigid and ascriptive. An individual who is born in a group will find it highly difficult, if not impossible, to move out of the group while still belonging to the society. Thus, one is born Arab, Druze, Shiite, Sephardic or Circassian and cannot opt out of the group with the same ease as one may marry into the upper class and, by so doing, espouse a different socio-economic class.

More than any other, it is this basic difference between industrialised and developing societies that has misled scholars and analysts on both sides. When interacting with developing societies, the West has consistently treated emerging nations as though they were cohesive states, or on their way to cohesion. They have assumed an often non-existent unity and sense of common destiny.

These states in the developing world were in fact Western creations. As a result of the European scramble for overseas territories, and to better control their colonies, Western powers gerrymandered these states and instituted permanent deformities in their societies, which, by the latter half of the twentieth century, had become irreversible. Not only had boundaries truncated nations and tribes, but they had also forcibly brought together groups with little in common under a single administration.

Since their independence and to this day, many of these states have been experimenting with borrowed forms of government. If England, France or the United States were such mighty and modern powers, they argued, surely their types of government had something to do with it? Further encouraging Western-style government was the development, by the colonial powers, of infrastructures patterned after their own.

These experiments are proving to be failures. About sixty countries in the world today are testimonials to the incompatibility of alien forms of governments in developing societies. More important still, they are questioning the validity of the unitary, statist approach to the developing world.

Identity-driven protracted social conflict

Protracted social conflicts flourish in Lebanon and other multi-communal societies in the world because these newborn states have failed in their nation-state-building efforts. These countries have not been able to generate the internal consensus needed to develop the stabilising structures and processes.²

In multi-communal, underdeveloped societies, conflicts emerge, for example, when the behaviour of the state is perceived to be dominated by a particular group or community within it, when communities feel threatened with marginalisation, or when no recourse for redressing

² For a good survey of this issue, see Walker Connor, 'Nation-building or nation-destroying', *World Politics*, 24(3) 1972, pp 319-55.

grievances exist. In deformed situations like this, identity becomes salient and acts as a motor for action and resistance against present and potential threats of discrimination. Communal identity needs, therefore, are powerful motivators for war and peace. How these needs are satisfied or repressed determines much of the history of these societies.

In general, identity-driven conflicts, such as that in Lebanon, occur to redress grievances and fears generated from several different sources in a specific political, social, and economic setting. They are pursued by means ranging from verbal and collective disobedience to violent and open warfare. Because identity needs are so fundamental to so many other needs, values, and interests, and because they epitomise the whole cluster of injustices within a socio-political system, they are powerful explanatory variables. The reality of identity needs is basic to an understanding of the nature of violent behaviour in many parts of the globe, including Lebanon.³

Unfortunately for those who suffer from them, identity-driven conflicts are obstinate and do not lend themselves to traditional forms of settlement. Furthermore, contemporary international institutions and the world system are not tailored to deal with these conflicts.

The United Nations, for example, like most regional organisations patterned after it, clearly limits its jurisdiction to inter-state conflicts. Article 2, chapter 7 of the UN Charter states that 'nothing contained in the present Charter shall authorise the United Nations to intervene in matters which are essentially within the domestic jurisdiction of any state.'

Identity-driven conflicts are threatening in several different ways: they are difficult to resolve because they linger on and do not present any easily detectable termination points; they appear to become dormant at times and then burst into open warfare at other times; they become triggers for other destabilising actions within and across political boundaries, and break out into open violence depending upon the internal or external triggers available.

These conflicts involve all segments of a society and not merely its ruling elites, thus making it possible for the conflict to manifest itself in every aspect of social life. In acute cases, every action, every statement,

³ For the needs approach to conflict, see John W Burton, *Deviance, Terrorism and War*, Oxford Martin Robertson, 1979 and *Global Conflict: The Domestic Sources of International Crisis*, Brighton, UK: Wheatsheaf, 1984. See also Abraham H Maslow, *Motivation and Personality*, New York: Harpers, 1954.

and every institution acquires value and meaning in relation to the conflict itself.

In Lebanon, for example, the conflict itself has become the *sine qua non* of loyalty, authenticity, personal dedication, and the ideological purity of individuals. Policies and behaviour are judged more by their service to the immediate goals of the conflict than to long-term and more complex national needs. In Lebanon, conflict is a full-time concern, overshadowing many other societal, communal, and individual interests. It has frustrated intra-communal opportunities for social and political alliances.

Protracted conflicts, like the one in Lebanon, immobilise people and institutions. They retard the system, and invite repression and exploitation of the economic and political resources available by those who favour the status quo.

These protracted conflicts challenge not only domestic institutions, but also regional and international ones. They provide fertile soil for outside intervention by friends, allies and other interested parties, and they precipitate crises and large-scale wars.

The protracted Lebanese conflict has continued to favour intercommunal equality of opportunity and integration within the social, economic, and political environment, rather than individual or class equality or power. Whether this will continue despite the failure of almost all of Lebanon's communities to achieve their goals has yet to be demonstrated.

Helplessness and the disincentives for conflict resolution

Protracted social conflicts feed on the paralysis and sense of helplessness that all participants acquire. They provide the environment for engaging in actions of self-entrapment and they block all opportunities for creative peaceful change. Seligman has discovered that at the micro-level individuals in pervasive conflict situations display a great deal of depression and 'learned helplessness'.⁴ In these cases severely depressed individuals will effectively load the dice against themselves by perceiving their chances of succeeding at a task as low, even before beginning it. Their depression is seen as a learned state, previous experience having taught the individual to believe that the ability to alter his life lies in *external agencies* rather than within himself.

⁴ M Seligman, *Helplessness: On Depression, Development and Death*, San Francisco: Freeman, 1975.

In protracted social conflict situations, individuals and communities become so frustrated and depressed that at times they stop trying to alter the situation. They conclude that all attempts at change are doomed to failure. This state of affairs encourages dependency on external parties rather than on one's own abilities and resources. In protracted conflicts dependency on external parties and allies is a constant. No matter how frequent or how intense are the shifts in frustration and threat, parties to identity-driven protracted conflicts continue to seek external support to create situations they consider favourable to their own communities and groups.

Dependency in PSC situations become a drug; change, and even the hope of a better future, are looked upon with disbelief, and the complex web of psychological motivations for remaining in conflict are more cogent than the difficulties and costs of failing an attempt to move beyond it.

Such comparisons between political and interpersonal problems must be drawn cautiously, as it is far too easy to see a society as being psychologically disabled through its involvement in a conflict. Habermas points out that 'mental conflicts that are repoliticised as protest can be shunted aside, made into problems that can be administratively healed and institutionalised'.⁵ Rather than confronting the issue, it is assimilated into the myth of the conflict. Such comparisons do, however, illuminate some of the psychological processes that can slow down the resolution of protracted social conflicts.

Fear and dependency on external actors in the Lebanese conflict

Protracted social conflicts are rooted in fear of marginalisation. When they occur in countries like Lebanon, which are made up of minorities and where no single community is able to dominate the others or is willing to be absorbed or to melt away, then fear leads to one strategy: dependency on external forces—groups, communities, and countries. This phenomenon of dependency on external support represents a community's approach to strengthening itself, redressing potential liquidation, or establishing hegemony over others. Unfortunately, dependency on external support becomes an addiction that perpetuates the conflict. Lebanon, Cyprus, and Northern Ireland are typical of this

⁵ Jurgen Habermas, *Theory and Practice*, Toronto: Beacon Press, 1973, p 42.

more general situation. Furthermore, would-be backers enter into relationships with Lebanese groups with their own agenda, and are therefore rarely reliable. They react to a different stimulus, usually regional and international, and cannot be expected to provide the components of long-term security which identity groups are seeking.

After eleven years of jockeying for the attention and support of a myriad of would-be backers, the Lebanese have collectively exhausted the options. Every community has tried a marriage of convenience with external and internal groups. Without exception, every Lebanese group has been disappointed with the outcome. Crisis and abandonment has been experienced by every Lebanese community. Groups, communities, and countries have come to help Lebanon, but unfortunately on their own terms and with their own agendas.

The cycle of fear and dependence manifests itself as a complex web of psychological components between groups in general, and also in their relationships to the conflict itself. This web locks the groups into the conflict which, in turn, begins to have functional significance for the groups. Henry Tajfel indicates that a protracted conflict becomes part of the culture, and the fact that it is 'protracted' becomes part of that society's mythology.⁶ The conflict becomes seemingly insoluble. With the passage of time, its complexities increase as do the functions it has for each of the groups' identities. Within the larger framework of myth and its functions for groups, one can see the psychological effect of protracted social conflict.

Fear manifests itself most strongly as a fear of *marginalisation*; of isolating oneself or one's group and thereby risking assimilation or destruction of that group. When marginalised members and groups are isolated from the conflict, they become stereotyped, possibly *scapegoated* or *victimised*. Isolated groups in such a precarious situation cannot become a party to the resolution of conflict for fear of losing whatever minimal gains they may have made.

Negative signals received from out-groups are exaggerated and even positive signals are seen in a negative light in order to protect one's group identity. Sheriff's experiments show that group identity, the desire to be distinct from other groups, enhances competition among peer groups. Isolation from the 'other' enhances one's group identity.⁷

⁶ Henri Tajfel, *Human Groups and Social Categories: Studies in Social Psychology*, Cambridge: Cambridge University Press, 1981.

⁷ Muzafer Sheriff, *Intergroup Conflict and Cooperation: The Robbers Cave Experiment*, Norman, Oklahoma: University of Oklahoma, 1961.

These fears of marginalisation and extinction lock one into a dependent relationship with the conflict. Any change contains the threatening possibility that one's position may weaken, leading to a lessening of one's status and rejection of one's identity. It was only by introducing the idea of superordinate goals in Sheriff's experiment that the level of in-group cohesion and out-group hostility could gradually be dispelled.

The major substantive grievances of Lebanon's conflicting communities

With seventeen officially recognised communities, Lebanon is a good example of a highly fragmented society experiencing PSC.⁸

Tensions between community and state Nation-state building has traditionally followed a dual path in Lebanon. The individual has turned to his identity group to satisfy his sentimental needs. He reaffirmed his identity by actively participating in community related activities. To satisfy his instrumental needs, however, the individual turned to the state. The state fulfilled those duties such as road-building, electrification, public education, etc.

When this system worked, and indeed in Lebanon it did for about thirty years, both sentimental and instrumental needs were being fairly satisfied. When, by imposing itself, the state attempted to sublimate, negate, or ignore sentimental needs of particular groups, or when it unfairly distributed instrumental rewards at the expense of one or more communities, the tacit equilibrium between state and community broke down, and the conflict shifted to a violent phase.⁹

Christian fears and grievances The Christians, and especially the Maronites, consider themselves the founders of the Lebanese Republic. Indeed, thanks in part to their long relationship with France, they championed the cause of an independent state, and rose to a

⁸ For a good overview of Lebanese conflict, see Edward E. Azar (ed), *Lebanon and the World in the 1980s*, College Park, MD: University of Maryland Press, 1983, Edward E. Azar et al., *The Emergence of A New Lebanon*, New York: Praeger, 1984, and Kamal S. Salibi, *Cross Road to Civil War: Lebanon 1958-1976*, New York: Caravan, 1976.

⁹ The hegemonic tendencies of the Lebanese communities have been relatively well documented. On Christian hegemony, consult Jonathan C. Randall, *Going All the Way: Christian Warlords, Israeli Adventures, and the War in Lebanon*, New York: Viking Press, 1983. On Muslim and Druze, see Jean-Pierre Peroncel-Hugoz, *Une Croix Sur Le Liban*, Paris: Lieu Commun, 1984 and *Le Radeau de Mahomet*, Paris: Lieu Commun, 1983.

predominant position within it, mainly for lack of nationalist support from other communities for Lebanon.

When other communities endorsed the idea of an independent Lebanon (between 1920 and 1943), the Christian, or at least the non-Muslim nature of Lebanon was a reality. Most of the governmental institutions were developed and controlled by Maronites. Their privileged position in the affairs of state was further reinforced by the demographic distribution of the day. A census carried out in 1932 showed the Christians, and the Maronites among them, to be slightly more numerous than the Muslims and Druze.

The National Pact of 1943, negotiated and implemented between the then two main groups of Lebanon, institutionalised power distribution according to religious affiliation. The President was to be a Christian Maronite, the Prime Minister a Sunni Muslim, the Speaker of Parliament a Shiite Muslim, the deputy speaker a Greek Orthodox Christian, and the Army Chief-of-Staff a Druze. Parliament was to represent a six-to-five, Christian-Muslim ratio, as were portfolios in the cabinet and in the bureaucracy.

Muslim fears and grievances With the changing demographic realities in Lebanon, and spread in education and sectarian awareness, two groups began to question the validity of the National Pact of 1943. The rigidity of the Pact caused increasing friction between the disgruntled communities and the state. The Shiites, whose numbers had increased faster than the Sunnis, demanded increased political participation to reflect their numerical strength. Their demands for better and larger political representation were stimulated for two reasons: first, Shiite regions (mainly South Lebanon and the Bekaa valley) had been left largely underdeveloped, whereas Maronite and Sunni areas had benefited from substantial economic growth and development and, secondly, the central government proved to be impotent in the face of the increasing PLO dominance of South Lebanon (from where it launched operations against Israel), and increasingly bloody Israeli retaliatory raids.

Shiite migration to Beirut (for both above-mentioned reasons) lent weight to Shiite demands. Anti-government demonstrations were common in the 1970s, often provoked by regional developments (such as the death of Nasser, Israeli commando operations in Lebanon, etc.) but inevitably ending up with governmental reforms and 'secularisation', the battle-cry for scrapping the Pact of 1943.

The Druze were the other disgruntled minority. Unlike the Shiites, the Druze are a small minority in Lebanon, forming perhaps only 8 per cent of the total population. As a numerically less significant group, the Pact of 1943 permanently blocked the Druze from holding top governmental positions. The demands of this group, then, were not rooted in demography. Rather, the Druze argued that since they had historically played an important role in the history of Mount Lebanon (an autonomous province of the Ottoman Empire, now part of the Republic of Lebanon), they could not accept to be relegated to a secondary, and largely insignificant role.

There were two, separate issues, then. One lay in the past. It called for a redistribution of power to reflect past realities. The other lay in the present and called for the abolition of the Pact of 1943 to make up for a presumably long-lost Christian majority. The Maronites, they argued, were no longer the largest group in Lebanon, and the Christians as a whole had become a minority within the country.

The validity of this assertion was never tested. No comprehensive census was carried out after 1932, for fear of proving what had been feared all along, namely that a high Christian emigration rate, compounded by a higher birth rate for Muslims, had turned the Christians into a minority. In any case, whether the claim was true or not is irrelevant; the perception was there, and it acted as a stimulus for increased opposition to the Pact.

The Christians reacted by justifying their pre-eminent position not on demographic strength, but on fear. Fear of absorption, fear of forced conversion, fear of oppression and domination compelled the Maronites to seek long-term measures of protection for their community. They argued that, of all Arab countries, only in Lebanon did Christians have a voice in the political affairs of the state. Indeed, Christians in Egypt, like those in Syria, Iraq, and Jordan, to name a few, were not equal citizens before the law, were subject to unpredictable cycles of persecution, and were politically marginalised as communities.

Regional and international intervention Academic, governmental and media analysts have greatly enriched the study of regional and international interventionism in Lebanon.¹⁰ This topic cannot be done justice in just a few pages. However, we will briefly identify some

¹⁰ For the dynamics of regional intervention, consult Itamar Rabinovich, *The War for Lebanon*, Ithaca, New York: Cornell University Press, 1984; Ze'ef Schiff and Ya'ari Ehud, *Israeli's Lebanon War*, New York: Simon and Schuster, 1984.

threshold events for the benefit of those readers who would want to research them in greater detail.

Regional interventionism has undoubtedly compounded the political, economic and sociological deformities in the Lebanese system. It has also reinforced the predisposition, among the various groups, to recruit outsiders and to ally themselves with them in order to alter the socio-political map of the country. We have identified two categories of foreign interventionism which differ in stated goal and means.

The *first* category, which we call *strategic interventionism*, includes Syria, Israel and the PLO, which had shifted the Arab-Israeli conflict into Lebanon in the early 1970s. The ability of these actors to influence the internal political scene has fluctuated between them, depending largely on factors dictated outside of Lebanon.

The PLO's influence was at its peak prior to the official Syrian intervention in 1976. It surged once again during the two years prior to the Israeli invasion of 1982. The Syrian influence in Lebanon stemmed in large part from its occupation of much of the country from 1976 onward. It suffered a temporary setback as a result of the Israeli invasion of 1982, which, for about two years, allowed Israel unprecedented influence inside Lebanon at the expense of Syria, the PLO and, of course, the Lebanese themselves.

The PLO's influence has become marginalised in Lebanon; Israel has drastically scaled down its goals. It has now retrenched to a narrow 'security belt' in southern Lebanon, while Syria has re-emerged as the dominant foreign power in the country.

More than any other, the role played by these three external actors has had the most devastating and long-term effect on the domestic structure. By virtue of their geographical proximity, Israel and Syria had a unique role in Lebanon. The same can be said of the PLO which, although a foreign actor, developed and operated parallel national institutions within the country. These three actors enjoyed a *de facto* legitimacy. Their policies within Lebanon were justified primarily in terms of security. Thus, Israeli, Syrian or Palestinian policies reflected above all a strategic posture with serious implications for the welfare of the respective regimes. Their intervention, legitimised in great part by alliances with various Lebanese groups, empowered them to carry out a penetration on the sociological level, with long-term implications.

The *second* category, which we call *tactical interventionism*, includes France, the United States, Libya and Iran, whose interventions,

although no less benign, have not commanded enduring influence in domestic Lebanese affairs. Being removed from the area of conflict, they have tended to rely on ideological concepts to justify their interventions. Libya, for example, supported the Nasserite and other Islamic groups in the name of pan-Arabism; Iran supported (and continues to support) Shiite groups in the name of Islam; the United States, and to a lesser extent France supported the status quo under President Gemayel in the name of legitimacy.

The tactical interventionists were not primarily concerned with Lebanon. They were either dragged in (witness the Multi-National Forces), or used Lebanon as a tool of diplomacy. In the latter case, Iranian and Libyan intervention served to enhance the domestic legitimacy of these regimes, and may have offered them some marginal bargaining benefits.

The strategic interventionists, in seeking long-term influence, sought to destroy, or at least control Lebanese institutions. Moreover, to ensure control over the communities, they not only abetted inter-group conflict, but also fuelled intra-group rivalries. This form of intervention has had disastrous consequences in Lebanon, with its pervasive influence in national institutions such as education, church, and mosque. In so doing, it has left behind a legacy that has further dimmed the prospects for internal reconciliation.

Management of the Lebanese conflict

PSC is a permanent feature of multi-commune societies. The question is not, then, how to *resolve* the conflict, but how to manage it positively, so as to pre-empt the breakdown of the equilibrium, and to funnel the pressures, the passions and the energies of the conflict to a positive end. PSC is not a phenomenon that can be resolved in the short term. It is too deeply entrenched in the geopolitical realities of today's world, and no institutions can do away with either the state or the community.

It has become axiomatic worldwide that the heart of the matter in Lebanon is the shift in power sharing. In that sense, the situation in Lebanon now is similar to that of Cyprus before the invasion by Turkey and to other cases such as Northern Ireland, Sri Lanka, Sudan, Canada—a good mix of Third World and developed countries. The present situation reflects demographic, cultural, and balance-of-power considerations in Lebanon and its region.

Focusing on the requirements for long-term stability of Lebanon amidst social, demographic and cultural upheavals in the region, the

integrity and independence of Lebanon and power-sharing reforms have to be the focal points of any negotiations and discussions among the Lebanese themselves.

To manage the Lebanese conflict and help the country move from war to peace, one needs to identify a set of principles upon which a framework can be devised.

We present here a set of principles derived from our research in comparative conflict resolution, and based on two workshops held at the Center for International Development and Conflict Management, University of Maryland at College Park, to which Lebanese official representatives of the major religious communities were invited for a period of four days each.¹¹ These groups agreed as follows:

- 1) The highest shared value among Lebanon's communities is the preservation and development of the state of Lebanon. There can be no room for balkanisation or incorporation of any part of Lebanon into another state.
- 2) Lebanon, a meeting place of Christianity and Islam, has a unique role in ameliorating tensions between West and East. Economic and press freedom give Lebanon advantages and turn it into a safety valve for regional problems.
- 3) Inter-communal solidarity and harmony can be increased through power-sharing, decentralisation and appropriate institution-building. Lebanon has to ameliorate the stresses and strains between state and community. Short of coming to grips with this problem, protracted social conflict will continue to escalate to fragment the state beyond repair.

The Lebanese ruling elites have to solve the problem of local participation by individuals and communities in regional government, particularly with respect to such issues as social services, education, and family law. Lebanon can be united without being centralised. Actual and perceived powersharing is enhanced by decentralisation.

- 4) Stabilising Lebanon requires a transition period during which communities engage in confidence-building and tension-reducing activities. Lebanon needs a transition period to build bridges, reduce the level of fear and enhance cooperative interaction

¹¹ For the detailed discussion of this meeting, see Edward F. Azar, 'The Lebanese Case', in *International Conflict Resolution*, Edward Azar and John Burton (eds), Sussex: Wheatsheaf, 1986, pp 126-40.

among communities. More than eleven years of building cleavages will not be easy to do away with.

- 5) There is no way to bring peace to Lebanon without massive reconstruction and development. In many cases around the world, security, freedom of movement and expression, communal identity and distributive justice have helped strengthen the process of nation-building and peacemaking. Lebanon, therefore, cannot have peace without a major reconstruction programme that promises hope to those who have lost it due to the war and the times that preceded it.
- 6) On the regional level, Lebanon can do certain things and hope that its neighbours and friends can support its efforts to end this bloody war. As an Arab League member and as a weak buffer between Israel and Syria, it must take pragmatic steps to protect its interests. Lebanon cannot alienate either side by allowing its territory to be used against its neighbours. Lebanon must be a close friend of Syria and a mediator and consensus builder in the Arab world.

We feel that these values and ideas are sound analytically and empirically. In studies on the transition from war to peace in other similar cases, we have found that conflict management and ultimate resolution depend on finding solutions to these three basic clusters of concerns:

- Security (physical and economic)
- Acceptance of communal pluralism (recognition and acceptance of multi-communalism is psychologically necessary and instrumental)
- Legitimate institutions and desired interactions (as a form of political early warning to predict and correct conflict generating activities and policies)

Any plan to deal with Lebanon's protracted social conflict will have to incorporate these concerns. However, without active and essentially unbiased third party facilitators, it is going to be very difficult for the Lebanese to move as suggested here. It is not clear at all that this approach is in operation now.

The Israeli occupation of South Lebanon

... we should prepare to go over to the offensive with the aim of smashing Lebanon, Transjordan and Syria ... The weak point of the Arab coalition is Lebanon [for] the Moslem regime is artificial and easy to undermine. A Christian state should be established, with its southern border on the Litani river. We will make an alliance with it.¹

David Ben-Gurion, May 1948

We have to establish a buffer zone in Lebanon as it is clear that the Lebanese government will do nothing to stop terrorism. The establishment of such a zone will obviously mean the annexation of part of Lebanese territory.²

Ariel Sharon, December 1981

This article sets out to characterise the nature of the Israeli occupation of South Lebanon, and to show the ways in which it afflicted, and continues to afflict, the lives of ordinary Lebanese and Palestinians. For it must be borne in mind that Israel still maintains up to a thousand 'military advisers' to direct and support Antoine Lahad's South Lebanon Army (SLA) in the 12 kilometre buffer zone. It is not within the scope of this article to investigate why the Israelis invaded Lebanon in 1982, or what they thought they were achieving during the occupation that followed. An analysis of Zionist plans for Lebanon is a treatise in itself—Ben-Gurion's strategy is by no means the earliest.³ Nor was the 1982 invasion Israel's first military incursion into Lebanon. The motives and military-political logistics of the Israeli invasion have been adequately covered elsewhere.⁴

The first phase

Apologists for Israel's invasion have made much of the way in which Israeli troops were hailed as liberators by local Shiite Lebanese and

showered with rice and flowers. Yet within four months of the ending of the siege of Beirut, resistance attacks by these same Lebanese had begun in earnest against the occupying army. Part of the reason for this was that the 'short operation to root out Palestinian terrorism' on Israel's northern border had already begun to take on a disturbing mien of permanence. Even while the war was still in progress in June 1982, leaflets were dropped in Tyre and Sidon asking residents to report to the local Israeli administrative centres for new identification papers.⁵ At the same time as declaring itself technically not at war with the Lebanese state, in the first weeks of the war Israel had bypassed the Lebanese administration and appointed military governors to all of the main towns in the South. By early 1983 a 27-page questionnaire had been circulated to all village heads in the South, which asked the names, ages, occupation, religious/political affiliation of every inhabitant of the village, including questions about relatives living abroad.⁶ If the village heads had produced such data, the Israelis would have known far more about the citizens of South Lebanon than the Lebanese government has ever known. To consolidate their bureaucratic hold on the South, the Israelis undertook extensive road-building works, started a postal service between the South and Israel, and connected Lebanese telephones near the Israeli border into the Israeli system.

Just as ominous for the South Lebanese were the trade links that were forged in an attempt to integrate South Lebanon into the Israel economy. During the withdrawal negotiations between Israel and Lebanon, Israel's chief negotiator, David Kimche, held out for the free movement of goods and individuals between the two countries declaring that 'the aim behind the movements of goods is not economic advantage, but to symbolise the hoped for new relationship.'⁷ The problem with the new relationship was that the flow of advantage was mostly one way. The Israeli newspaper *Ha'aretz* of 21 February 1983 reported that ten tons of strawberries were passing from Israel to Lebanon on a daily basis. The same article goes on to record the Israel Fruit Council's estimate that over 2,000 tons of fruit, including grapes, mangoes and apricots, had been exported to South Lebanon since the

⁷ Ignacio Klich, 'Assault on Lebanon's economy', *Middle East International*, 13 May 1983.

eginning of the war.⁸ Estimates gathered from Israeli press reports posit a figure of \$100 millions-worth of exports from Israel to Lebanon in the first year of the war.⁹ The Southern Lebanese markets were flooded with Israeli goods right up to the withdrawal of the army from Il but the buffer zone in early June 1985—some fruit and vegetable stalls did not even bother to conceal plastic bags with their Hebrew lettering. Not only did the subsidised imports seriously undercut the more expensive, locally grown products, but Lebanese exports were ruined when Arab countries started imposing bans on Lebanese produce for fear of importing Israeli goods.

Israeli plans for the South were by no means just bureaucratic and economic, but affected the very demographic structure. Although it is important to point out how the exactions of the occupation affected Lebanese and Palestinian alike, it is also fair to note the special role that the Palestinians had in Israeli demonology, and the concomitant attention which was meted out to them in the first flush of the occupation. The blanket bombing of 'Ain al-Hilweh refugee camp in Sidon during the first days of the war reduced the camp substantially to rubble, leaving 40,000 Palestinians homeless. On top of the destruction resulting from the invasion, houses were systematically bulldozed and blown up long after the fighting had ceased.¹⁰ A report from UNRWA, the United Nations organisation in charge of Palestinian refugees' welfare, described the camp of 'Ain al-Hilweh as totally destroyed, that of Rashidiyyah as 20 per cent destroyed, Borj al-Shemali 35 per cent destroyed and al-Bass 50 per cent destroyed. The thorough levelling of the camps, added to right-wing Israeli ministers' expressed wish to drive the Palestinians out of South Lebanon altogether,¹¹ led the Palestinians to believe that the very least they could expect was the breaking up of the camps as entities, and the severe reduction of their numbers in Lebanon as a whole.¹² Initially, the Israelis even prevented the distribution of tents to homeless refugees,¹³ and it was not until 14 October 1982, after much international protest, that the Palestinians were able to rebuild substantial shelters. By the winter, 60,000 people were still homeless.

This fear has resurfaced after the pitched battles between Amal and the Beirut Palestinian camps of June 1985 and 1986.

Lebanon—Towards Legal Order . . . , op. cit., p 18

Along with the smashing of the PLO's military structure in the South came the destruction of the PLO's medical and welfare services. Over five-hundred staff had been operating nine hospitals and eight clinics, which serviced Lebanese and Palestinians alike. UNRWA schools were destroyed, as were the social services and public health facilities of the PLO and Palestinian Red Crescent Society. For all its faults, PLO control in the South had also generated wealth through the influx of millions of Arab dollars; the invasion shattered this local economy, and as the occupation tightened, many families with relatives living abroad were cut off from remittances and left in a state of near destitution.

Heralding a new order in Lebanon, the Israelis often utilised old enmities to bring it about. Immediately after the invasion, Saad Haddad's militia, set up by the Israelis in 1978, was allowed to extend its influence up to the Awali river north of Sidon. With a number of instances of indiscriminate shelling of civilian centres and allegations of a massacre perpetrated at Khiam, Haddad had hardly endeared himself to Lebanese or Palestinians. On the coat-tails of the Israeli army came the Lebanese Forces, the military arm of the right-wing Maronite Phalange party. These were allowed to operate from areas east of Sidon, where they had never before had a presence. One of their first acts was to level the upper part of the Mieh Mieh Palestinian refugee camp on 7 August 1982, thus giving practical expression to their historic hatred of Palestinians. Over one thousand Palestinians were made homeless, and an atmosphere of intimidation against Palestinian civilians was to continue right up to the April 1985 war in Sidon, when the Lebanese Forces were finally obliged to leave the Sidon area.

Reports from relief workers in South Lebanon note the campaign of terror waged against the Palestinians from the late summer of 1982 right through to the following year. Leaflets were distributed by the extremist Christian group, the Guardians of the Cedars, claiming that even civilian Palestinians were a danger to Lebanon. Better-off Palestinians living in the suburbs of Qay'a, Hillaliyah and 'Abra were forced out of their homes by masked men issuing death threats. Palestinian shops and businesses were bombed, and a number of Palestinians were assassinated when they dared stray outside the relative safety of 'Ain al-Hilweh refugee camp.¹⁴ In February 1983, in an uncharacteristically direct statement for the International Red Cross, the outgoing head

¹⁴ International Centre for Information on Palestinian and Lebanese Prisoners, Deportees and Missing Persons, Centre International d'Information sur le Droit Humanitaire, Paris, *Newsletter* No 7, 1 April-18 May, 1983.

delegate for the organisation squarely laid the blame for this intimidation on the shoulders of the Israelis: 'Nothing can happen in Sidon without the agreement of the Israelis, who have done nothing to halt this process of intimidation, thereby violating the 4th Geneva convention that requires the Occupying Power to protect the civilian population.'¹⁵

Alongside the extension of influence of Haddad's militia and the introduction of the Lebanese Forces to areas east of Sidon, the Israelis set up and armed a number of 'National Guards' in Sidon, Nabatiyyah and Tyre, as well as offering arms to Lebanese villages 'for their own protection'. The Israelis were able to recruit from a number of different sources. Hussein 'Akar, who held sway in the tenements of the T'ameer area of Sidon, bordering 'Ain al-Hilweh camp, was a Lebanese mercenary who had previously worked for one of the groups within the PLO. He was prepared to throw his lot in with anyone ready to arm him and allow him to continue his extortion and protection rackets. 'Abu Arida', who dominated old Sidon with a band of teenagers, was originally arrested and held in Ansar; release was granted provided he cooperate with the Israeli military authorities. The network of spies and collaborators brought numerous assassinations and inter-community strife for months after the Israelis had withdrawn from the bulk of the South, as old scores were settled and guilt by association was enough to condemn innocent and culpable alike.

One strategy of Israeli control, then, was the creation of armed local militia groups, as well as the exacerbation of historical enmities; the Lebanese Forces were allowed to harass the Palestinians in Sidon, and Haddad was permitted to brutalise both Lebanese and Palestinian communities, to levy taxes¹⁶ and to assume the role of the legitimate Lebanese authorities.

Ansar and other detention centres

Despite the fact that Ansar prison camp is now no more than a pile of rubble, it lives on in the memories of at least half the male population of South Lebanon, who passed through it at one stage or another. More than any other reason, Ansar is given as the driving force behind the resistance in the South. It became the university of the resistance movement and a symbol of its determination.

¹⁵ *Lebanon—Towards Legal Order* . . . , *op. cit.*, p 20.

¹⁶ *The Times* (London), 16 June 1983.

It is well documented that the majority of prisoners were not taken during the combat in the first days of the invasion, but in wide sweeps carried out by the Israeli Defence Forces (IDF) of towns, streets and refugee camps in the aftermath of the war. Thousands of males between the ages of 14 and 60 were herded on to Sidon's beaches and were picked out by hooded informers for their alleged participation in Palestinian guerrilla groups.¹⁷ Testimonies of the brutality of the IDF towards the prisoners, and reports of prisoners beaten to death in custody in places like the Safa fruit factory in Sidon are also well recorded.¹⁸

In the first period after the war, Ansar was only one of a number of detention centres used to contain these prisoners, and the 39th session of the UN Commission on Human Rights states 'with reasonable certainty' that prisoners were even being held in Israel and the West Bank, which is in direct contravention of Article 49 of the 4th Geneva Convention forbidding the transfer of prisoners away from their country of capture. Nor was this the last time that Israel effected the mass transfer of prisoners; after the final closure of Ansar in April 1985, more than a thousand Lebanese and Palestinian prisoners were bussed to Israeli's Atlit prison.

Throughout Ansar's history, conditions of detention caused an international outcry. The camp was insanitary, overcrowded and lacked sufficient space for recreation facilities or for personal hygiene. By the summer of 1983 press reports recorded twenty-one deaths; at least six of those who died had been shot by prison guards.¹⁹ Conditions in the camp were a cause for concern for members of the Knesset as well as for the international community. Knesset member Amnon Rubenstein described the conditions in Ansar as intolerable and said that they were a stain on Israel's reputation.²⁰ The prisoners were not granted prisoner-of-war status by Israel, nor were they allowed any right of appeal against their detention, except to a panel of Israeli military officers. One year after the invasion Israel had released 4,000 detainees,²¹ but the numbers were constantly being topped up by new arrests of Lebanese and Palestinians suspected of resistance activities or for refusal to cooperate with the Israeli authorities. There were constant protests from prisoners about the poor conditions, as well as strikes and demonstrations in villages and towns in the South as a whole.

²⁰ *Ha'aretz* (Tel Aviv) 6 December 1982.

²¹ *Lebanon—Towards Legal Order* . . . , *op. cit.*, p 23.

By the summer of 1983, when resistance operations against the IDF were in full swing, Israeli tactics of blockading southern Lebanese villages, rounding up all the men between the ages of 14 and 60, and making mass arrests were well established. For example, *Le Monde* of 10 May 1983 records that 3,000 Israeli soldiers surrounded the village of Qaraoun and herded all the males together into the sports stadium, randomly arresting and taking away sixty-three of them. An Israeli officer announced that this was going to happen every week—an accurate prediction. Israeli arrests of civilians were not always random—*Le Monde* and the *International Herald Tribune* of 3 June 1983 record the arrest of 250 Palestinians and Lebanese from the professional classes, which was seen as an attempt to paralyse economic activity as well as encourage the exodus of other professionals from the South. Meanwhile, the local Lebanese paper *L'Orient le jour* of 30 July 1983 reported the arrest of three representatives of the Federation of Trade Unions of Workers and Labourers in South Lebanon for 'refusing to cooperate with the Israeli authorities.'

In addition to Ansar, the only prison camp to which the International Red Cross had access throughout the occupation, there were known to be a number of other detention centres, where prisoners were kept for initial interrogation before release or graduation to Ansar. These were the Serail in Sidon, the local government building taken over by the IDF, the Tobacco Regie in Nabatiyyah, the Israeli military headquarters in Tyre, and the Haddad-administered prison in Khiam near the Israeli border. The Khiam prison is still in operation, and until the release of forty prisoners at the beginning of June 1986, Amnesty International estimated that over a hundred prisoners were still being held there. The Israelis also operated a detention centre on Mar Elias hill overlooking Sidon, which was opened in February 1984 until the withdrawal from Sidon on 16 February 1985.

Prisoners in Ansar were held for anything up to two years. Far from wasting their time in detention, Lebanese and Palestinians organised literacy classes, first aid lessons and group studies of the Koran and the history of Islam. Small sheets of Red Cross papers, allowed the prisoners for writing messages to relatives, were often beautifully adorned with pictures, or contained poems about the nature of steadfastness, or the beauty of South Lebanon. Intended as a weapon to intimidate the local population and deprive it of its leadership, Ansar became a potent symbol of Israeli oppression, and an engine of Lebanese resistance.

Tightening the noose

By the autumn of 1983 the Israelis had withdrawn to the Awali river, leaving the Shouf mountains to erupt behind them in fighting between the Druze and the Lebanese Forces which the Israelis had allowed to infiltrate there. A new chapter of the resistance had begun by the suicide bombings of the US and French military bases on 23 October 1983 in Beirut. Nor did the Israelis escape attention when the first southern suicide bomber struck the Israeli Intelligence HQ in Tyre, killing sixty-one people.²²

The Israelis tightened their security arrangements and consolidated their occupation of the South, which culminated in their closing the Sidon-Beirut road at the Awali river and opening the Bateer-Jezzine crossing in the mountains. Jezzine was a Phalangist stronghold, and this new crossing-point turned the forty-minute drive along the coast road to the South into a five-hour journey along narrow mountain roads through what was enemy territory for most Muslim Lebanese and Palestinians. The latter part of the Bateer-Jezzine crossing was controlled by the Lebanese Forces, who took every opportunity to arrest whomsoever they chose.

It was only possible to leave the South and attempt re-entry if one had first obtained a permit from the Israeli headquarters at Kafr Falous. Most Palestinians did not even bother to apply. Nor did the permit prevent arrest at the Israeli Intelligence office at the Bateer-Jezzine crossing, or cut short the hours of waiting in long and querulous queues, or forestall the arbitrary closure of the crossing to suit the whims of the Israeli troops. Only the International Red Cross were able to take their cars across with impunity; both UNRWA and the Lebanese Red Cross vehicles were searched and harassed. Nor could either organisation guarantee the evacuation of Lebanese or Palestinians requiring urgent medical treatment in Beirut. The merits of medical cases were often judged by non-medical Israeli officers as to their seriousness, and by November 1984 there were at least sixty known cases of people needing treatment who had been denied access to Beirut.²³

The Bateer-Jezzine crossing was also a means of imposing an economic blockade of the South, preventing the free movement of goods out of and into the occupied territory. It was a familiar sight when

²² Some fifteen of the bodies were thought to be Lebanese and Palestinians. A number were found with their hands handcuffed behind their backs.

²³ Lebanon Information Processing Service, *Bulletin No. 2*, produced by the British Refugee Council, London, January 1985.

approaching the crossing from Beirut to come across over a mile of trucks, some of which had been waiting for days to gain access to the South. The prospect of such a wait was daunting for anyone wishing to transport perishable commodities. Nor could the trucks be driven across once they had been cleared; they had to be unloaded and the goods carried on to other vehicles waiting on the far side of the crossing.

The Israelis arbitrarily and selectively imposed bans on certain types of goods reaching the South; building materials and bitumen for road repairs were both banned for a time, and all clinics in the South suffered throughout the period from shortages of one type of drug or another, whether it be penicillin or medicines for the treatment of diarrhoea. Costs of such commodities soared in the South, and many local humanitarian organisations were running up huge deficits on drugs bills alone. The blockade cut both ways; while Israeli agricultural produce flooded markets in the South, local citrus rotted on the trees. Local growers could not afford to pick it when there was no guarantee of the produce ever reaching Beirut. Poorer Lebanese and Palestinians, dependent upon the citrus groves for agricultural wages, faced even greater hardship with unemployment coupled to rising prices.

There are very few reliable figures, or even sources for figures estimating the damage to the economic infrastructure and production in the South. However, a report from the Sidon Chamber of Commerce for 1983 (ie before the economic blockade really began to bite) estimated that the industrial sector in the South witnessed a drop-off of 50 per cent of sales since before the invasion. Coupled with this was an increase of 60 per cent in the cost of raw materials. Meanwhile, the Chamber of Commerce report states that the agricultural exports for 1983 were 50 per cent of those of 1981; the fall-off of this sector is reckoned to have hit the South hardest because up to 40 per cent of the population are said to gain their income from it. Agriculture is also seen to have suffered from the exodus of young people from the South occasioned by the Israeli occupation. An article in the *Financial Times* of 19 February 1985 quotes Hussein Khanan, ex-chairman of the Council for the South, as estimating citrus production down 85 per cent since before the invasion.²⁴

Economic facts and figures do not adequately convey the sense of isolation, desperation and claustrophobia suffered by the population of

²⁴ The same article also contains supporting data for the collapse of the Lebanese economy as a whole, after the invasion. For example, it quotes an IMF report that real output is expected to be about half of the corresponding level before the conflict began in 1975.

the South, nor the way the occupation destroyed ordinary life. No one leaving for work in the morning could guarantee arriving on time, or even getting there at all, so arbitrary were road blocks and arrests. Most families in the South must have suffered the agony of having a relative disappear, only to be told some weeks later that they had turned up at Ansar. The longer the occupation lasted the more ill-disciplined and trigger-happy the Israeli troops became (discipline was never a prerequisite for joining Haddad's militia, or, after April 1984, the South Lebanon Army). Innocent civilians were killed and wounded at checkpoints, or when they walked into resistance 'operations' against the Israelis. The IDF's response to these operations was to 'power fire' around them in a 360° circle for up to a minute. Operations against Israeli patrols were often hit-and-run, a fact the Israelis must have known.²⁵ Often the only people killed by Israeli retaliatory fire were passers-by. Palestinian camps were subject to night-time sweeps by the IDF, Lebanese houses were broken into at dawn and arrests were made. As in the West Bank and Gaza, people suspected of 'terrorist activities' had their houses blown up.

The environment of everyday life became one of fear and uncertainty. Because the cost of living was rising steeply and unemployment was rife, coupled with the fact that many families had male breadwinners in Beirut or locked up in Ansar, most local development organisations found that all of their budgets were being consumed by welfare work. The overall effect of the occupation was to reduce the general level of self-sufficiency of the communities in South Lebanon and to make them dependent on welfare handouts from large welfare organisations, which are usually confessionally based in Lebanon, or on smaller, secularly run non-governmental organisations. The increasing role such organisations were playing in community support made them a target for Israeli attack. Thus it was that local Amal leaders in villages were rounded up and detained, and non-governmental organisations such as Secours Populaire, a community medical organisation, had their hospitals, clinics and staff harassed by Israeli troops. One interesting aspect of the occupation was the increased social role it lent to women, particularly in the urban centres and camps, who carried out the majority of social and welfare work. It was still the case in South Lebanon that women were generally viewed

²⁵ A question that no commentator asked was if the safety of Israeli soldiers was paramount, why did they continue foot patrols through city centres right up to the end of the occupation?

as being of less danger to the occupation than men, and were thus afforded more mobility.²⁶

Withdrawal and the 'Iron Fist'

The political change in Israel that led to the formation of a government of 'national unity' on 16 September 1984 made the final Cabinet decision to withdraw from Lebanon, taken in January 1985, that much easier to bring about. The Israelis had suffered what were for them heavy losses in resistance attacks in the South, the 17 May accord between Israel and Lebanon brokered by the US had been long-scuppered by Syria,²⁷ and internal opposition to the occupation within Israel had become very strong. The National Resistance, the coalition of groups fighting the IDF in the South, were quick to claim the decision to withdraw as a victory for their efforts. It was the first time that the Israeli army had been seen to retreat from Arab soil. However, the Israelis exacted a terrible price for their withdrawal, sowing seeds of discord in the South which are even now producing fruit.

The official Israeli announcement of the institution of the 'Iron Fist' policy was made on 21 February 1985, ostensibly to protect the retreating Israeli army from unnecessary resistance attacks. However, as most Lebanese and Palestinians were aware, the policy was no more than an announcement to the world of practices they had come to regard as the norm. Take, for example, the attack on seven Lebanese villages north-east of Tyre on Thursday, 13 December 1984. According to local press reports and Lebanon radio²⁸ this was carried out by 3,000 troops using tanks and armoured personnel carriers who stormed the villages in the early hours of the morning and were resisted by villagers wielding sticks, stones and boiling oil. The attack resulted in three dead, twenty-three injured and another sixty arrested. The dead were described as 'terrorists' who had been 'shot while trying to escape'.

I visited the village of Borj Rahal soon after this attack and found its condition to be typical of descriptions of many villages in the South after just such an assault. These attacks on Lebanese villages were so well covered by the local and international press that, like the South African government, the Israelis banned journalists from entering the occupied

²⁶ This was true until the 17 year-old woman, San'a Moheidati, became the first woman suicide bomber on 9 April 1985.

²⁸ *Al-Safir* and *al-Nahar* (Beirut) 14 December 1984.

area without an Israeli permit (obtainable in Jerusalem). Most of the buildings in the village had bullet holes, the village clinic had been wrecked and all the drugs had been tipped out in a heap on the floor. Copies of the Koran had been ripped up and scattered in the religious meeting place, or Husseiniiyyah. In subsequent attacks on other villages people had their furniture wrecked, their videos and televisions stolen, their savings ripped up and their houses destroyed.

Villages suspected of being centres of resistance activity were subjected to week-long blockades. Electricity and water was cut off, exit and entry was prohibited, not just for villagers but for UN troops stationed in the South or for the International Red Cross. Israeli assaults on villages in the spring of 1985 were conducted with particular ferocity. On 11 March 1985, the day after a suicide bomber had killed twelve Israeli soldiers close to the Israeli border, Israeli tanks and armoured personnel carriers ploughed into the village of Zarariyyah, injuring or killing tens of people. The photograph on the front of *al-Safir* newspaper of 12 March shows the carcasses of three smashed cars with the bodies of their drivers inside, run over by Israeli tanks.

A number of unexplained incidents in the last six months of the occupation convinced the local population not just of its brutality, but also of its vindictiveness. On 21 January 1985 a 100 kg car bomb placed under the residence of Mustafa Saad, leader of the Sunni Moslem community in Sidon, ripped through Saad's flat, severely wounding and blinding him and killing his daughter Natasha, aged 12. Less than a month away from withdrawal from Sidon, the Israelis had already been warning of a bloodbath that would follow their departure from the area. They strenuously denied involvement in the bombing, but never provided a satisfactory explanation of how anyone could have smuggled such a huge quantity of explosives into the South and past the myriad checkpoints that surrounded Sidon. Again, on 14 March a bomb exploded in a mosque in the village of M'aarakah less than forty-eight hours after an Israeli raid on the village: it killed a leader of the resistance movement, Mohammed Saad, amongst a number of others. On 23 February seven people were shot dead in the village of Sir al-Gharbiyyah. During a visit to the village a few days later I spoke to the father of a youth of 17 who was among the dead. He alleged that the seven had not been killed outright, but had been mortally wounded and had been left to bleed in the dirt; no one had been allowed to approach to administer first aid. He said that three of the bodies had stab wounds, and one was found down the village well.

Towards the last months, 'security arrangements' became positively Byzantine. A dusk till dawn curfew was imposed; out of fear of suicide bombers there was a prohibition placed on motorcycles or motorists driving alone in their cars. Local clinics and hospitals were warned that if they treated anyone wounded during resistance activities they would be closed down. After the withdrawal from Sidon and the setting up of a crossing-point at the Litani river, access to the new occupied area was made just as difficult as was the Bateer-Jezzine crossing. Often the Litani bridge was closed, and local people wishing to reach Tyre had to risk a walk through the banana plantations and over a footbridge which frequently came under Israeli sniper fire. The market town of Nabatiyyah was made virtually a ghost town from 11 o'clock in the morning for ten days before the Israeli withdrawal, when the SLA machine gun-post on the hill overlooking the town opened up with regularity on the streets below.

An interesting aspect of the occupation, which there is little time to deal with here, was the way the Israelis presented it to the outside world. It was stated that the security of every Israeli soldier was paramount to the Israeli government; meanwhile, Israeli soldiers would footslog round Sidon until the last weeks of the occupation of that city, offering themselves up for resistance attacks. The very use of the word 'terrorist' to describe resistance attacks against an army of occupation was an astonishing semantic feat which did not deter the BBC's Jerusalem correspondent from using it. In April 1985 the inhabitants of South Lebanon were surprised to see a TV news item showing Moshe Arens, then the Israeli Defence Minister, addressing an Interpol conference on international terrorism in New York, and complaining about the problem of fanatical Shiite terrorism which Israel was facing on its northern border.

That no one has counted the innocent Lebanese and Palestinians who were gunned down during the occupation while more than adequate media attention was focused on the anguish of bereaved relatives of Israeli soldiers who were killed is perhaps the one triumph of the occupation for the Israelis.

The legacy

Although the Israeli army has withdrawn from the bulk of Lebanese territory, it still maintains look-out posts and military positions on a

swathe of hills overlooking the heart of South Lebanon. The occupier buffer zone itself is maintained under the same conditions as afflicted the rest of the South: entrance and exit is by permit only, the bottom has dropped out of the local agricultural market, which is flooded with Israeli goods, and there is an effort to depopulate, particularly the Shiite villages, through intimidation and violence.

The uneasy truce that now exists between the main Shiite movement Amal, and the Israelis is easily shattered, as was witnessed earlier this year when the more radical Hizbollah group attacked an Israeli patrol and kidnapped two Israeli soldiers. A three-day IDF sweep in the South, similar to attacks carried out during the 'Iron Fist' campaign, was a stark reminder, if any was needed, of the power and ruthlessness of the IDF. On 13 June 1986 this year Reuters reported a more formal offer of status quo from the Israelis to Amal: they would be prepared to withdraw if Amal could guarantee the safety of Israel's northern border. It is unlikely that Amal would be seen negotiating with the Israelis, or if some agreement could be worked out, it is doubtful the Israelis would abolish the SLA.

The violence and brutality of the occupation is indelibly burned on the memories of a whole generation of Lebanese and Palestinians. But perhaps the most lasting effect of the episode is the contribution it has made to the process of confessionalism and cantonisation which has rapidly accelerated in Lebanon as a whole since the Israeli invasion. Just as the Israelis brought the Lebanese Forces into conflict once more with the Palestinians at Sabra and Shatila, and with the Druze in the Shouf, so the Israelis precipitated the cantonisation of the South. By allowing the Lebanese Forces into the areas east of Sidon and arming them, the Israelis had actively encouraged the war which broke out there a month after they withdrew. The Lebanese Forces kept the town of Sidon pinned down for six weeks with Israeli ordnance. Once the Israelis withdrew from Jezzine, in the mountains overlooking Sidon, the signal had been given that there would no longer be support for the Lebanese Forces' action—they withdrew in their turn and the Palestinian and Nasserite armies swept up the hill driving 60,000 Christian villagers before them. Many fled to the buffer zone on Israel's northern border. South Lebanon today is almost the perfect picture of a confessionally divided territory; there is the Druze Shouf, Sunni Sidon, Shiite south and SLA-dominated Christian buffer zone. Nationalist Christians trying to return to their villages east of Sidon have reported their harassment at the hands of the SLA when they expressed their wish to

return, and continue to report sniping from SLA positions on to their fields and villages.

There are many unanswered questions about the Israeli occupation: if they did not intend to annex South Lebanon, why did they stay so long? What is plain, however, is that the brutality of the occupation and the heroism of ordinary Lebanese and Palestinians will live on in popular mythology despite the lasting damage done to the local economy, infrastructure and balance of the communities.

Appendix: Chronology of the invasion and occupation

- 1981 24 July UN mediates ceasefire between Israel and PLO
1982 3 June Schlomo Argov assassination attempt
5 June 200 civilians die in Israeli bombing of Beirut
6 June Israeli invasion
1 July Phalangists brought in by Israelis to Beirut
1 August Multinational Force arrives, first PLO units leave
23 August Bashir Gamayel elected President of Lebanon
14 September Bashir Gamayel assassinated
15 September Israeli army invades West Beirut
16–18 September Sabra/Shatila massacre
23 September Amin Gamayel made President of Lebanon
1983 3 January Start of Israeli–Lebanese withdrawal negotiations
18 April Suicide bomber destroys US Embassy killing forty-six
17 May Israeli–Lebanese withdrawal agreement
14 September Druze and Lebanese Forces fighting after Israeli withdrawal from Shouf
23 October Suicide bombers on US and French army HQs
4 November Suicide bomber attacks Israeli Intelligence HQ in Tyre
23–24 November Six Israeli soldiers exchanged for 4,446 Lebanese and Palestinians
984 14 January Saad Haddad dies of cancer
mid-February Israelis close Beirut–Sidon road, open Bateer–Jezzine
16 September National Unity government elected in Israel
20 September South Lebanon Army kill thirteen people at Sohmar
985 21 January Assassination attempt on Mustafa Saad in Sidon
16 February Withdrawal of Israelis from Sidon
21 February Announcement of start of 'Iron Fist' policy
3 March Bomb in Ma'arekheh mosque kills Mohammed Saad
12 March Israeli attack against Zarariyyah
18 March Outbreak of fighting in Sidon
2 April Transfer of prisoners from Ansar to Atlit in Israel

THIRD WORLD QUARTERLY

- 24 April Lebanese Forces withdraw from Sidon
29 April Israelis leave Tyre
6-7 June Israelis 'complete withdrawal' from Lebanon

ERRATUM

In Dragoslav Avramovic's article, 'Depression of Export Commodity Prices of Developing Countries: What can be done?' which appeared in the July 1986 issue of *Third World Quarterly*, instead of 'the presence on primary producers' on page 953, paragraph one, the text should read: 'the pressure on primary producers'.

Third World Quarterly regrets this error.

North-South Monitor

THE UN SYSTEM

▲UNCTAD Trade and Development Board (TDB)

Thirty-second Session

Geneva, 10-21 March 1986

■The TDB ended its spring session with all parties expressing disappointment at the lack of progress. The first week of the meeting was dominated by discussion of the interdependence of problems of trade, development finance and the international monetary system, considered alongside the debt and development problems of the developing countries. The TDB also undertook its sixth annual review of protectionism and structural adjustment during the session, and considered the agenda and the location of the UNCTAD VII conference, scheduled for 1987.

In the continuing discussions on interdependence, a contrast was apparent between the more optimistic economic projections of the Organisation for Economic Cooperation and Development (OECD) countries, and the continued warnings from representatives of the Group of 77 (G77) developing countries of a crisis in development. Representatives of the industrialised countries drew attention to the favourable prospects for growth in the OECD, given low inflation rates and the fall in oil prices, which should in turn stimulate the developing economies. They highlighted recent efforts by the industrialised countries to realign their exchange rates and lower interest rates, through the Group of Five,¹ to make their economic policies more consistent, to tackle the debt problem through the 'Baker Plan',² and to curb protectionism in their own markets, not least through their welcoming a new round of trade talks under the General Agreement on Tariffs and Trade (GATT). While representatives of G77 welcomed the growing recognition of the need for broadly based and coherent international reform, they insisted that the measures did not go far enough. According to Jayantha Dhanapala of Sri Lanka, speaking on behalf of G77, there was still too much emphasis on adjusting the domestic policies of the developing countries and on conditionality, and not enough on unfavourable external factors, such as low commodity prices, high real interest rates, persistent protectionism, and meagre financial flows. These factors he attributed to the policies of the industrialised countries and the major financial centres, suggesting that it seemed almost the case that the recent reforms undertaken by the industrialised countries had been initiated more in the interests of Western banks and of redressing trade imbalances within the OECD, than for the benefit of the developing countries. Adolfo Raúl Taylhardat of Venezuela, criticising the 'dangerously contradictory policies' of the industrialised countries which simultaneously deepened the development crisis and expanded output and world trade, drew particular attention to the shortsighted nature of attitudes to the decline in oil prices. Far from welcoming it, the industrialised countries should be aware that the external debt of OPEC countries amounted to \$200bn and that the actions of these debtor countries could have a powerful impact on the international banking system. A S Consalvez of India

The North-South Monitor was written and researched for Third World Quarterly by Maya Jaggi.

North-South Monitor

criticised the industrialised countries for enunciating general principles on trade liberalisation and then conspicuously lacking the political will to implement these principles in practical terms. Emphasising that for India, the decision to begin a new round of trade talks was not a *fait accompli*, but depended on progress made in the GATT Preparatory Committee, he said that it was futile discussing the new areas of safeguards, textiles and agriculture while the past commitments on 'standstill' and 'rollback' remained unfulfilled.³

On the specific problem of international debt, representatives of the industrialised countries expressed the belief that the crisis had been defused by lower interest rates and rescheduling, and they reaffirmed their faith in the 'Baker Plan' and in the case-by-case approach to the problem. G77 countries, however, cited a worsening of the problem in view of the falling export earnings of some of the debtor countries. José Carlos Mariategui of Peru emphasised the political and social toll exacted by the adjustment measures imposed on debtor countries. As a contribution to a lasting solution, he advocated the linking of a maximum percentage of financial outflow from debtor countries to a minimum growth target in the domestic product. At least, he said, 'debt service payments should be limited to a percentage of export earnings compatible with the development needs and economic and social requirements of each country'.

In reviewing the protectionism and structural adjustment undertakings made at UNCTAD VI in Belgrade in 1983, the TDB was unable to reach agreement as to its conclusions. G77 introduced a draft resolution recommending four extra guidelines for the Board's treatment of the issue:

- the review should concentrate on analysis of specific sectors;
- those sectors should be of particular export interest to developing countries;
- new product areas of interest to developing countries should be continually identified;
- the outcome of the review should be specific trade policy measures, recommended for adoption by developed countries.

The draft resolution also advocated the setting up of an intergovernmental group of experts, to draft recommendations for the review, as well as the fixing of a time-frame for enacting the recommendations. The proposal was accepted by the socialist countries, including China, but rejected by the Western countries, which offered an alternative position paper. This paper:

- insisted that the review remain general and balanced, covering all countries, and preferably using more information and statistics;
- suggested more of a function for the UNCTAD secretariat in reviewing structural adjustment, paying attention to all groups and to the role of domestic policies;
- placed the responsibility of resisting protectionism and furthering structural adjustment firmly on all countries.

No decision was taken on the agenda and location of the forthcoming UNCTAD Conference, particularly since G77 had not yet formulated its views on the issues it wanted to see covered. It had, however, established its own preparatory committee to produce such an agenda. Meanwhile, the TDB instructed UNCTAD's Secretary-General to submit a draft provisional agenda to the resumed session of the Board on 16-17 June 1986.⁴

● 'By comparison with last September's excellent debate on interdependence we have had on this occasion a somewhat colourless and unoriginal exchange of views,' Pierre Louis Girard, of Switzerland, speaking on behalf of the OECD countries. *UN Press Release* (Geneva) TAD/INF/1781, 24 March 1986.

▲ UN Convention on the Law of the Sea (UNCLOS)

Preparatory Commission for the International Sea-Bed Authority (ISA) and the International Tribunal for the Law of the Sea
Fourth Session
Kingston, Jamaica, 17 March–11 April 1986

■ The Preparatory Commission, consisting of representatives of the 159 countries and international organisations which are signatories to UNCLOS, conducted discussions on three main issues: commercial exploitation of the sea-bed outside the regulations provided by UNCLOS; overlapping claims to sea-bed mining sites; and the rules of procedure for the organs of the ISA.

The Commission adopted by vote a resolution explicitly criticising Britain and West Germany for failing to ratify UNCLOS, and for issuing licences to private companies, allowing them to begin commercial exploitation of the international sea-bed, thus undermining the Convention. According to the resolution, proposed by the Group of 77 (G77) and adopted by a vote of 59 to 7 against (Belgium, Canada, France, Italy, Japan, Luxembourg and the Netherlands) with 10 abstentions, these actions were 'wholly illegal and devoid of any basis for creating legal rights'. The move followed a similar condemnation at the previous session of the US, which had also not ratified UNCLOS, and was actively proposing an alternative 'reciprocating states' regime' involving Britain and West Germany, which entailed issuing licences to private companies in opposition to UNCLOS arrangements.² The developing countries were concerned that the unlimited exploitation of sea-bed minerals by private companies would flood and depress mineral markets, to the severe detriment of land-based mineral producers. They also foresaw protracted disputes if mining companies were to operate without regulation in areas disputed between states-parties to UNCLOS and non-parties. Britain and West Germany, present as observers at the session, argued, however, that UNCLOS had not yet entered into force and had not achieved universality. The treaty is to come into force a year after sixty states have ratified it. So far there are twenty-six ratifications. Moreover, Britain, West Germany, the US and other countries had abstained at its adoption in 1982, on the basis that its provisions for regulating sea-bed mining restricted the rights and interests of private enterprise. These countries said that even when it became law, UNCLOS would bind only those states which had ratified it.

Progress was reported at the session towards the resolution of the problem of overlapping claims to sea-bed mining areas. Of the four states qualifying principally for 'pioneer investor' status, only India's claims, in the Indian Ocean, were uncontested. Those of France, Japan and the Soviet Union overlapped, mainly in the north-east Pacific Ocean, and those claims needed to be settled before the rules of registration of pioneer investors could be finalised and registration begin. The

North-South Monitor

Commission heard that the 'Arusha Understanding' reached between the four states during confidential negotiations in Tanzania in February 1986, provided the basis for a final agreement. It was noted informally at the session, however, that commercial exploitation of the sea-bed might not begin in earnest for several years, despite the settling of claims. It appeared that financiers were wary of providing funds for research and development while the international legal regime governing the sea-bed remained unclear.

The Commission completed the first reading of the procedural rules of the ISA Council, which is to consist of thirty-six members representing regional groups and major interests. It postponed consideration of the setting up of a finance committee, on the basis that all financial matters would be considered together at a later stage. It also continued discussion of the procedural rules of the ISA Assembly, and began to consider those of the Legal and Technical Commission, one of the two main organs of the Council. The Commission also heard reports on the work of its four special commissions.⁶

The next session of the Commission was scheduled for New York, from 11 August-5 September 1986.⁷

▲ Commission on Transnational Corporations (TNC's)

Twelfth Session

New York, 9-18 April 1986

■ The Commission's regular session adopted three resolutions concerning TNC's in South Africa and Namibia, and the activities of the Centre on Transnational Corporations (CTC).

A resolution proposed by the Group of 77 (G77) condemned the apartheid regime in South Africa and its illegal occupation of Namibia, together with those TNC's that continued to collaborate with the regime in the nuclear, military and economic fields in violation of the relevant UN General Assembly and Security Council resolutions. It urged all states, organisations, banks and TNC's to implement the recommendations of the panel of eminent persons which had conducted hearings on the activities of TNC's in Southern Africa. It also recommended the continuation of the Secretariat's work in collecting and disseminating information on the activities of TNC's in the region, and its presentation of an up-dated report to the Commission's thirteenth regular session. The resolution was adopted by 32 votes to 3 (Britain, Switzerland and the US), with 6 abstentions (Canada, France, Italy, Japan, the Netherlands and West Germany). The countries abstaining on the resolution, or voting against it, tended to reaffirm their opposition to apartheid, as well as to sanctions against it, or stressed the adherence of TNC's associated with their own countries to existing codes of conduct.⁸

A further resolution adopted by a vote of 31-9-1, proposed further research and analysis by the CTC on the role of TNC's, and ways in which their function could be improved. The CTC was to report to the Commission at its next session. A resolution adopted by consensus recommended that the Centre bring up to date its report on 'Transnational Banks: Operations, Strategies and Their Effects in Developing

North-South Monitor

tries', including analysis of such issues as the ways in which transnational banks operate on external debt with developing countries, and the interaction between these banks and the International Monetary Fund (IMF)."

UNESCO

Executive Board Meeting

Paris, 7-23 May 1986

The key issues on the agenda were financial problems attendant on the US and British withdrawals from UNESCO in 1984 and 1985 respectively, and Britain's request for observer status in the organisation. Also discussed, though not on the official agenda, was the prospect of nominating a new Director-General when the term of Amadou Mahtar M'Bow expires in November 1987.

In his opening speech, the Director-General said that the 30 per cent reduction in UNESCO's budget owing to the withdrawal of the US, Britain and Singapore, had necessitated the abolition of 558 staff posts in the secretariat, in addition to the 977 lost the previous year. The Executive Board did not, however, accept a Soviet proposal, first made at the previous Board meeting in September 1985,¹⁰ for the massive removal of US and British nationals from UNESCO's staff, as a means of fulfilling these cuts. A compromise proposal adopted by the Board's Administrative and Finance Commission did, however, recommend efforts to ensure the 'representation of all member-states' in the secretariat.

Britain's request for observer status in UNESCO was granted, despite the opposition of the Soviet Union and the francophone African states, which reportedly felt that it should at least be subject to delay. The relevant resolution also asked the Director-General to open talks on restoring diplomatic immunity for UNESCO officials, which Britain, in the face of strong protest from M'Bow, had refused to do in 1986.

Though the nominations for the post of Director-General were not due until the end of 1986, moves began among Western countries to oppose the re-election of M'Bow to a third term. The position of these countries appeared to be that they were not merely directly campaigning for reforms within the organisation, but had resolved that the removal of M'Bow was a prerequisite for change. The alleged inefficiency and politicisation of UNESCO since 1974, under M'Bow's leadership, were among the reasons cited by the US and Britain for withdrawing, and other countries including Japan threatened to follow suit if M'Bow was re-elected. A rift seemed to have merged among the Western countries, however, following a meeting of the 'Major Group' in March 1986. This group consists of the twelve Western industrialised countries which each contribute more than one per cent to the combined budget of UNESCO and its agencies. The group apparently agreed in principle to an Australian proposal that all heads of UN organisations should serve a maximum of two five-year terms. It was reportedly divided, however, by the subsequent action of the Australian representative at UNESCO, Gough Whitlam, who sent a full text of the allegedly confidential minutes of the Geneva Group meeting to M'Bow and the Executive Board. Following this breach of confidentiality, it seemed that some

Nicaragua's government, true. They have never denied that there are also three priests occupying ministerial positions as well as other independent moderates. Nicaragua is not a single-party state nor is Marxism-Leninism the official ideology. In the Soviet literature, Nicaragua is not even considered a 'state of socialist orientation', a term used to depict countries such as Ethiopia, Afghanistan, Angola, South Yemen and Mozambique. Furthermore, the Sandinistas have constantly stressed their disagreement with Marx's contention that 'religion is the opiate of the people'.

The book under review could be divided into three main sections. The first major part is concerned with power and interests. The chapters in this section address themselves to issues on the formal structure of government at local, regional and national levels. The other chapters delve into the role of grass-roots organisation, the armed forces, the Church, women, the bourgeoisie, the media, and Nicaragua's ethnic minorities. Some of these issues have been the subject of much controversy but the authors deal with them adequately.

The second part of the book is concerned with economic policy. Contrary to the Kissinger Commission Report, Nicaragua had used the structuralist approach which is common in Latin American countries. Its economic performance—as measured by the growth of GNP from 1980 to 1983—has actually been the best in Latin America. Its foreign debt, however, has increased rapidly from \$1.6 billion in 1979 to \$4 billion in 1984. Nicaragua is also facing a number of serious economic problems, eg a balance-of-payments deficit, a sharp drop in commodity pricing, the heavy cost of the war against the *contras*, lack of credit for development projects, and most recently the US trade embargo.

The third part deals with social policy. This is the real measure of the effects of development policies in such areas as agrarian reform, education, health, social welfare, housing, food policy and culture. Given the vast problems they face, one would expect that little would have been accomplished. However, as the authors confirm, more has been achieved in some of these areas in the first five years than most Latin American countries have achieved in decades. Grass-roots participation has been a key element in making possible the literacy crusade in 1980, in preventive health care, neighbourhood sanitation, low-income housing, and food distribution. However, since 1984, some social programmes have been curtailed and human and material resources are being diverted to defence because of the '*contra*' war.

The most interesting part of the book is the discussion of international dimensions. Since 1979, the Sandinistas have followed an independent non-aligned foreign policy; diversity in diplomatic and economic relations has been central to this policy. Trade and financial links with the socialist and non-aligned countries were initiated in 1979–80, and have since experienced a

North-South Monitor

commit themselves to financial assistance in the way the African countries had hoped for, and frequently characterised the sum requested as excessive. Cataloguing their own foreign aid endeavours, they insisted that the session was not a pledging conference, and that as parliamentary democracies, they had no prior mandate to offer specific funds.

In his own speech, US Secretary of State, George Shultz¹⁴ made efforts to demonstrate political support for African moves away from the 'discredited orthodoxies about state-directed development' towards economic liberalisation and providing incentives for individual initiative, and particularly for farmers. He elaborated a five-point programme for Africa, which included:

- transferring aid from the public to the private sector;
- creating a liberal environment for foreign investment;
- liberalising trade;
- increasing multilateral lending through the International Monetary Fund (IMF) and the World Bank;
- funding research into achieving a 'green revolution' in Africa, comparable to that in Asia.

Like the other major industrialised countries, however, the US was not prepared to offer extra aid or to countenance a discussion of international debt outside the existing multilateral financial framework. Nor would debt be considered on any other basis than the customary case-by-case approach, which rewarded individual debtor countries espousing the requisite adjustment policies. In their opposition to regarding Africa's external debt as a special case, the industrialised countries found unexpected allies in some non-African developing countries within the Group of 77 (G77), particularly those in Latin America. These countries, failing to exhibit the Third World solidarity sought by Africa, seemed reluctant to allow a form of special treatment for debtor countries from which they would be excluded.

The unyielding stance of the industrialised countries had three exceptions. The Netherlands announced its willingness to cancel all service and principal repayments for five years, totalling around \$80m. on government Overseas Development Assistance loans to low-income African countries which were undertaking effective adjustment policies. Canada offered a moratorium on all debt repayments on government development loans to sub-Saharan Africa. Finally, Denmark announced that it had submitted a proposal to its parliament for the cancellation of outstanding debts owed by Tanzania.

The UN Programme of Action, adopted by the special session without a vote, consisted of two main elements: the African commitment to orchestrate its own development, embodied in the APPER; and, predicated on that commitment, the complementary international response. The \$128bn plan was endorsed, but since no external financial commitment was forthcoming, countries merely agreed to make 'every effort to provide sufficient resources to support and supplement Africa's effort'. On debt, 'the magnitude of Africa's debt and the severe and restrictive burden which it places on many African countries' was recognised, but redress was to come only through existing mechanisms, which 'should respond flexibly and be improved appropriately'. Echoing APPER, the programme entailed the highest priority for agriculture, to be encouraged through investment and incentives; the fostering of the private sector; the improvement of economic performance; the

was strongly influenced by Shariati and was staunchly anti-American, anti-Marxist, anti-Shah and anti-clerical. It was constantly on the lookout for religious leaders who would 'betray the revolution'. Election results of the last four years are taken at face value (pp 139 and 260). The blend of vehement anti-Westernism and anti-communism is treated as if it was something completely new in the modern world (pp 330-1). But there were certain gentlemen in the 1930s running around in central Europe who spoke a very similar language. The official view seeps through Hiro's detailed account of the US embassy takeover. The real reason for the takeover is described as the desire to 'seize the documents' that proved the US was conspiring with the Shah and with the Kurdish rebels (p 136). In fact, the real reason was to undercut Bazargan's Provisional Government and, in the midst of a national crisis, ratify the highly clerical constitution that had been drafted against the wishes of the more moderate and secular cabinet ministers. Similarly, Hiro has a full chapter—some twenty-seven pages—on the hostage crisis leaving the distinct impression that in the whole incident Iran scored a major victory over the US. It is only much later, in a brief paragraph tucked away in the chapter on the Gulf War (p 173), that one discovers the final outcome of the crisis—Iran had to pay \$3.7 billion to various Western banks, place \$5.4 billion in a special account to cover claims brought by other Western companies and submit to the decisions of The Hague International Court. American corporations would be happy to see more such Third World victories. In the art of writing history from accounts of living participants it is always best to keep in mind Marx's favorite motto: *de omnibus dubitandum* (doubt everything).

What we still need is a book on the Iranian revolution that will not only ask the right questions and provide answers that are scrupulously impartial, but will also combine theory with history, social science with empirical data, political-science constructs with old-fashioned spade work in primary sources, and broad generalisations on politics, especially Third World politics, with a healthy respect for the details of the drama being played out in contemporary Iran. Maybe the next generation will produce such a book.

North-South Monitor

Abdou Diouf of Senegal, Chairman of the OAU, describing the gathering as 'the conference of the last chance', said that sanctions were the only available means of achieving change in South Africa, and preventing a conflagration in the country. The purpose of the conference, he felt, was to define procedures for the practical implementation and coordination of sanctions, in combination with increasing aid to the Frontline States (FLS) and to the Southern African liberation movements, the African National Congress (ANC) and the South West Africa People's Organisation (SWAPO). Nigeria was the first country to pledge extra aid for the FLS and the liberation movements, offering \$50m over the next five years. In a further practical move, the Nigerian Foreign Minister, Balaji Akinyemi, urged free registry states, which offer 'flags of convenience', to make it illegal for oil and shipping companies under their jurisdiction to trade in oil with South Africa.

The Commonwealth Secretary-General, Shridath Ramphal, called on the major economic powers to cease trading with South Africa, countering their well-rehearsed argument that sanctions would harm the neighbouring states and the people of South Africa most, by pointing out that the FLS had repeatedly announced their willingness to accept the consequences of those sanctions. Both he and Oliver Tambo, the President of the ANC, cited the report of the Eminent Persons' Group (EPG) which had been set up by the Commonwealth Summit in Nassau in October 1985.¹⁶ Oliver Tambo said that the failure of the EPG, fully acknowledged in its own report, proved that the Botha regime was not prepared to resolve South Africa's problems by negotiation. He explicitly condemned the US, Britain and West Germany as co-conspirators in the crime of apartheid. It was the few countries that wielded great power and exercised the veto in the UN Security Council, which had hindered the formulation of a truly global consensus on apartheid, sheltering the regime from decisive international action.

The conference adopted a declaration which said that apartheid was irreformable, that no encouragement would be given to spurious attempts to reform it, and that it must be 'totally uprooted and destroyed'. It called for mandatory economic sanctions as the most effective, peaceful means of ending apartheid, the alternative being escalating violence and bloodshed. Urging South Africa's trading partners to 'reassess their positions and cooperate in rather than hinder international action,' it said that it was important and urgent for the UN Security Council to identify the Pretoria regime as a grave threat to international security, hence making it liable for the imposition of mandatory sanctions under Article VII of the UN Charter. The Declaration noted that the movement of world opinion in favour of sanctions and in support of Southern African liberation struggles offered the opportunity for decisive international action against apartheid and for Namibian independence. It cited three prerequisites for a lasting solution in Southern Africa:

- the speedy and total elimination of apartheid;
 - the immediate and unconditional release of all political prisoners; and
 - negotiations with the 'genuine leaders of the oppressed people of South Africa'.
- Included amongst the declaration's provisions were a particular reference to the failure of the 'constructive engagement policy' espoused by the US, and concern at the consequences for international peace and security of Israel's collaboration with South Africa, particularly in the nuclear field.

The one reservation made to the declaration was by Australia, which said that it

North-South Monitor

did not support the recognition of 'the right of the people of South Africa and Namibia to choose their means of struggle'. Australia also objected to the naming of Britain and the US as obstacles to mandatory sanctions, in applying their vetoes in the Security Council. It was these vetoes, the declaration continued, which had facilitated South Africa's increasing destabilisation of the FLS. An original reference to the Commonwealth EPG report as finding the Pretoria regime responsible for the violence in South Africa was deleted in the course of the debate.¹⁷

●The absence of the US, Britain and West Germany from the conference 'is a disservice to the conference and an even greater disservice to themselves'. Shridath Ramphal, Secretary-General of the Commonwealth Secretariat. *The Times* (London) 17 June 1986.

'Current reports confirm that the governments of these countries remain determined to persist in that ignoble and dishonourable role of allies in a truly murderous regime. If those who have the power to impose sanctions fail to do so now, then history will surely judge them as co-conspirators and participants in the commission of a crime of immense dimensions.' Oliver Tambo, President of the ANC. *The Times* (London) 18 June 1986.

'The time is now well past the eleventh hour. Comprehensive mandatory sanctions are no guarantee for a less violent change in South Africa. They are, however, an historical statement that humankind did not sit idly by.' Witness Mangwende, Foreign Minister of Zimbabwe. *Financial Times* (London) 18 June 1986.

COMMODITIES

▲International Coffee Organisation (ICO)

Council Meeting

London, 28 April-2 May 1986

■In an inconclusive session, the seventy-five members of the ICO discussed the allocation amongst the fifty producer countries of new percentage shares in the global coffee market. The current export quotas, determined in 1981 and reconfirmed in 1984, expire on 30 September 1986. The quotas which replace them will, however, remain in force until the expiry of the current International Coffee Agreement (1983) in October 1989.

Disagreements centred on the criteria for determining the quota entitlements of producer countries. The ICO traditionally uses past export performance levels in deciding percentage shares of the market, but at the time of the meeting, this criterion favoured countries with small percentage shares at the expense of Brazil, with its 30 per cent share of ICO sales. Since the suspension of export quotas in February 1986¹⁸ when the poor Brazilian crop had caused prices to rise above the ceiling determined by the International Coffee Agreement, other countries had been eroding Brazil's sales, and on current performance would therefore have been entitled to higher quotas than they had received at the previous allocation. Brazil, however, resisted all suggestions that its percentage share should be reduced, taking issue with the fixing of long-term quotas on the basis of one poor year. Furthermore, while it was in Brazil's interests to settle the question of quota allocations as soon as

North-South Monitor

possible, before its sales were further eroded, no other countries seemed willing to recognise any urgency in making a decision. As supply quotas were the ICO's mechanism for regulating prices, and had been suspended when prices rose, there seemed to be no need to consider individual quotas until the coffee price fell to levels where export controls would be automatically reimposed. There was speculation that prices would only begin to near this level of \$1.35 per pound after August 1986, when the threat of frost in Brazil, and therefore of further shortages, had receded. The Council decided merely to establish two working groups, one of consumer countries and the other of producer countries, to examine possible criteria for future allocations. These groups were not scheduled to meet till the end of June 1986.

More decisively, the Council established a system for penalising ICO producers which sell at a discount to non-ICO consumer countries. It was decided that when export quotas were reimposed, countries selling their coffee more cheaply to non-members, or failing to produce documentary evidence of the arrival of sales to non-members, would suffer the sanction of a cut in their export quotas. It was apparently understood at the meeting that the US's continued membership of the ICO depended to a certain extent on the Council's agreement to institute such penalties. The US confirmed its continued membership at the session, having conducted a detailed study of the considerations involved, but the implementation of this decision depended on the approval of the US Congress, in turn sensitive to the question of abuses by producer countries within the ICO. While the decision on penalties had the approval of the majority of the ICO members, it was reported that the EEC countries were hostile to the decision, on the basis that it required more time for deliberations. A few EEC countries voted against the US proposals, while most of them abstained.¹⁹

▲ UN Conference on Natural Rubber, 1985

Second Session

Geneva, 5–23 May 1986

■ Representatives of some fifty rubber producing and consuming countries attended an inconclusive reconvened session to negotiate a new International Natural Rubber Agreement (INRA). Though the current INRA of 1979 expires on 22 October 1987, its successor agreement should ideally be concluded by October 1986, to allow time for it to be ratified by governments before the old pact expires. A first attempt at negotiating a new INRA had been made in April–May 1985, but had failed owing to disagreements over the price range which the pact would seek to defend.²⁰

There was apparently agreement between producing countries (chief among which are Malaysia, Indonesia and Thailand) and consuming countries (including the EEC, the US and Japan) on only two points: that price stabilisation should be the primary objective of a new pact; and that the pact should be 'financially viable'. There were differences, however, as to the interpretation of these parameters, and as to other features of the pact. According to the Conference Chairman, Manasapas Xuto of Thailand, there were three key outstanding areas of dispute:

- Price level and structure: at the previous session producers had suggested a

North-South Monitor

reference price (which determines when the buffer stock manager may or must buy or sell rubber to control the price) of 265 Malaysian or Singapore cents per kilogramme (against a current reference price of 201.66 cents) and this proposal apparently still stood, though its proponents implied that it was negotiable. Consuming countries had already, however, rejected such a price level as being too high, and as disregarding market trends, which they believed should be respected by any pact. They pointed out that the buffer stock, currently standing at 365,000 tonnes, had only been purchasing not selling, indicating that even the current reference price was very high. The representative of the EEC, Oswald Van Wauve, carefully distinguished between price stabilisation and price support. In contrast, the producers' spokesman, Ahmed Farouk of Malaysia, considered price stabilisation meaningless unless it proved remunerative for producers, fair to consumers and led to an expansion in developing countries' export earnings. He also argued that the higher reference price was needed to offset increasing production costs and to encourage investment, which would in turn secure future supply.

- Price adjustment mechanism: the consuming countries were satisfied with the buffer stock as the sole mechanism for controlling prices, while producers wanted to consider supplementing it with export controls.
- Financing the buffer stock: consumer countries, particularly the EEC, wanted the buffer stock financed solely by members' contributions, allowing it no commercial borrowing powers. In this regard, they were strongly influenced by the collapse of the International Tin Agreement (ITA)²¹ whose buffer stock operations had ceased in October 1985. Their reservations continued despite assurances from the Conference Chairman that INRA differs from the ITA in two important respects: the buffer stock manager has no power to trade in forward contracts or make forward purchases which he may be unable to finance; borrowing under INRA only occurs at the request of a specific government in respect of its own shares in the buffer stock, and it therefore remains liable for any debts incurred on its behalf.

Producers rejected a compromise proposal by Manaspas Xuto to retain the present reference price and adjustment mechanism in a new agreement. The session adjourned, to resume on 6–17 October 1986.²²

▲ International Tin Council (ITC) Seventeenth Ordinary Session London, 29 May–4 June 1986

■ The ITC's twenty-two producer and consumer countries met for their second session since their last failed attempt to reach a negotiated solution to the 'tin crisis'. The price of tin was currently at a ten-year low of £3,500 per tonne, and at the previous ITC session in March 1986, all export controls on tin had been suspended.²³

The market intervention provisions of the sixth International Tin Agreement (ITA) had been suspended indefinitely since 24 October 1985, when the Council defaulted on net debts of £900m with no remaining resources to finance them. Since that time, numerous abortive attempts to resolve the crisis had been made.²⁴ A few creditors had had their claims partially met out of court, but the only remaining means of the creditor banks and brokers securing compensation was by suing the

North-South Monitor

ITC's member-governments, which disclaimed responsibility for the Council's debts, on the basis of their sovereign immunity. A final attempt by eleven creditor banks just prior to the meeting to settle the problem by negotiation rather than litigation failed to elicit a positive response. A letter from the banks to the member-governments, sent through the ITC Chairman, Peter Lai, and suggesting discussions on the outstanding claims, was merely acknowledged in the Council session, with no suggestion of acceptance.

No decision on the future of the ITA was taken at the meeting, but there was apparently a consensus that the current agreement would be the last. It was virtually decided that there would be no renewed attempt at international cooperation to regulate tin supplies and prices after the sixth agreement expired at the end of June 1987. A suggestion that the ITC could be transformed into a study group for collecting and disseminating information and statistics was also rejected. Member-governments appeared to wish to distance themselves from the ITC, partly in embarrassment at its conspicuous failure, and partly because any continuity could make them more liable to be pursued into court by ITC creditors. It seemed likely, however, that an entirely new body, established under the auspices of the UN Conference on Trade and Development (UNCTAD) could assume the role of a study group for tin.

The next session of the ITC was scheduled for 1-3 October 1986, in London.²⁵

DISARMAMENT

▲ Soviet Union-United States

Arms Control Negotiations: Fifth Round

Geneva, 8 May-26 June 1986

■ Soviet and US negotiators met for their fifth round of nuclear and space talks in an atmosphere of mutual recrimination. They accused each other of having failed to meet the obligation, assumed at the superpower summit in November 1985,²⁶ to accelerate their progress towards an agreement. Viktor Karpov, the chief Soviet negotiator, charged the US with having escalated tensions and heightened the military threat through its actions against Libya. The chief US negotiator, Max Kampelman, countered by attacking the Soviet Union's presence in Afghanistan, and its supplying of weapons to Colonel Ghadafi. He further accused the Soviet Union of being more concerned with propaganda and splitting the Western alliance than with serious arms control.²⁷

The negotiations were further complicated by Soviet suggestions that the convening of a second superpower summit depended on their achieving specific results, particularly in the fields of intermediate-range nuclear forces (INF) and nuclear test banning. A preparatory meeting for the summit had been cancelled by the Soviet Union in April 1986 in protest at the US raid on Libya, and a subsequent letter from the Soviet leader, Mikhail Gorbachev, to the British Prime Minister, Margaret Thatcher, while more conciliatory about the prospect of a second summit, had failed to suggest new proposals to break the deadlock in the Geneva talks.

North-South Monitor

On arrival at Geneva, both sides affirmed that they were bringing no new proposals to the table, but expected responses to their standing offers.²⁸ Notwithstanding these assertions, and an agreement of confidentiality on the substance of the talks, details of new proposals emerged. The US suggested improved means of verifying the INF cuts which it had proposed in the previous round. It advocated a joint standing commission to investigate alleged violations, and continual on-site inspection to ensure the destruction of existing medium-range weapons and the absence of new weapons on residual sites. Renewed US emphasis had been placed on the verification of arms control measures, in apparent response to the paucity of information surrounding the accident at the Chernobyl nuclear reactor on 26 April 1986. The relevance of Chernobyl to arms control was, however, staunchly denied by Viktor Karpov, who moreover rejected the US's INF proposals as a basis for negotiation. The Soviet Union, for its part, introduced a draft treaty on INF on 15 May 1986. It was acknowledged by the US to have been presented without the customary surrounding publicity, but was alleged to constitute only a formal codification of previous statements. It therefore failed to meet the US requirements on at least two counts: it covered medium-range missiles in Europe without restricting Soviet mobile missiles in Asia, and it repeated demands for a freeze on the British and French independent nuclear forces.

The main new proposal of the fifth round hailed from the Soviet side. On 29 May 1986, the Soviet negotiators tabled a proposal for mutual cuts in strategic forces to the level of 8,000 nuclear charges each, as an interim measure towards the achievement of a 50 per cent cut in strategic weapons. These cuts were, however, to be linked to a strengthening of the Anti-Ballistic Missile (ABM) Treaty. This treaty of 1972 restricting defensive weapons systems, allowed each party to withdraw from it following six months' notice, on the grounds that the treaty 'jeopardised its supreme interest'. The Soviet Union now proposed a commitment that neither side would withdraw from the pact for at least ten to fifteen years.

On space weapons, the proposal suggested a division into three categories:

- defensive weapons for intercepting and destroying enemy missiles;
- offensive weapons for destroying enemy satellites;
- offensive space-to-earth weapons, a possible new development, for destroying enemy forces.

The Soviet Union proposed to link restrictions on defensive space weapons, as well as on strategic forces, to the strengthening of the ABM Treaty. In a concession from its previous position, where the ending of space weapons research was a precondition for strategic cuts, there was to be no restriction on basic research, though no new laboratory research beyond the basic threshold already reached in the US was to be permitted. There was to be a ban on building prototype defensive weapons. There could also be separate agreements to liquidate existing anti-satellite weapons and prohibit the development of new ones, or of space-to-earth weapons, as partial measures towards a comprehensive accord on space weaponry.

On INF, the Soviet Union proposed the interim elimination of all US and Soviet medium-range missiles in Europe, and a freeze on the numbers of British and French weapons, though they would be exempt from initial cuts. A letter from Mikhail Gorbachev to President Reagan on 22 June 1986, was reported to have hinted at a possible compromise on INF which would allow the Soviet Union to

North-South Monitor

retain some medium-range missiles in Europe and Asia, with corresponding US retentions in Europe and elsewhere.

The informal US response, as signalled by conciliatory remarks by President Reagan,²⁹ was cautiously positive. The initial impression appeared to be that concessions had been made but that the proposal required further negotiation. The plan reverted to the definition of 'strategic', contained in the Strategic Arms Limitation Treaty (SALT), as 'long-range', rather than the Soviet Union's insisting on classifying as strategic all missiles capable of striking Soviet territory, including, therefore, US medium-range missiles in Europe. It also made the concession of excluding from cuts US forward-based systems (such as fighter bombers in Europe and on aircraft carriers), though it did require their levels to be frozen. It permitted long-range (more than 600km) sea-launched cruise missiles on submarines (where the Soviet Union positioned most of its own) while banning them from surface vessels (where the US stationed them).

A further Soviet suggestion at Geneva covered verification of long-range mobile missiles, apparently as a challenge to the US contention that their activity was unverifiable and therefore merited a total ban. Rather than being a detailed proposal, the Soviet plan indicated possible means of verification, such as monitoring missiles as they leave the factories, and restricting them to certain specified areas in order to facilitate detection. It was reported that the Soviet suggestions mirrored previous US verification proposals, and in that sense, too, constituted a challenge to the US to accept the implications of their own stated position.

The chief Soviet proposal of the fifth round came after President Reagan had made a major announcement on the impending implementation of a US 'proportionate response' to alleged Soviet violations of SALT II. On 27 March 1986 President Reagan had proclaimed his intention to breach SALT II by continuing to equip US B-52 bombers with cruise missiles, beyond the 130 bombers stipulated by SALT II, unless the Soviet Union curbed its alleged violations of the treaty. He said that the Soviet Union had developed a second land-based intercontinental ballistic missile (ICBM), the SS-25, and the illicit encoding of missile test data, in contravention of SALT II. He cited two further conditions for US observation of the treaty as the reversal of the Soviet Union's unprecedented arms build-up, and its allowing progress at the Geneva arms talks. In the meantime, the US would remain within the technical bounds of the treaty by dismantling two obsolete Poseidon submarines as sea trials began on a new Trident submarine, the *Nevada*.³⁰ The Soviet Union's Geneva proposal was, however, understood to have been formulated before Reagan's announcement, and not to constitute a reply to it. The Soviet response, contained in a statement on 31 May 1986, was to condemn the US attitude to SALT II as a threat to arms control in general, to deny the alleged violations, and to declare its intention to increase its own forces if the US exceeded the limits of the treaty.³¹

At the end of the fifth round, Max Kampelman expressed a cautious optimism over the main Soviet proposal, a tone which Viktor Karpov resolutely refused to echo. The talks were set to resume on 18 September 1986, by which time the US had undertaken to prepare its formal response.³²

● I have determined that in the future, the United States must base decisions

North-South Monitor

regarding its strategic force structure on the nature and magnitude of the threats posed by Soviet strategic forces and not on standards contained in the SALT structure which have been undermined by Soviet non-compliance, and especially in flawed SALT II Treaty which was never ratified, would have expired if it had been ratified, and has been violated by the Soviet Union.' US President Ronald Reagan announcing the US decision no longer to consider itself bound by SALT I *International Herald Tribune* (Paris) 28 May 1986.

'The situation at the Geneva talks on nuclear and space weapons has clearly been aggravated . . . The grave doubts we had even earlier about the real wish of the American side to have new agreements have now been forcefully supported by Anatoli Dobrynin, senior foreign policy adviser to the Soviet leader, Mikhail Gorbachev. *International Herald Tribune* (Paris) 21-22 June 1986.

NORTH ATLANTIC TREATY ORGANISATION (NATO)

▲ Defence Planning Committee (DPC)

Brussels, 22-23 May 1986

■ The spring session of the biannual DPC was attended by defence ministers from NATO's sixteen member-countries. France was not represented, as it does not participate in strictly military discussions within the alliance. The ministers were, however, considering within the routine framework of the DPC, a US proposal to recommence the manufacture of chemical weapons after a lull of seventeen years, probably the most significant NATO decision since the deployment of Cruise and Pershing missiles in Europe.

The proposal was being presented to the committee by US Defense Secretary Caspar Weinberger, as a 'force goal' or a suggested NATO objective which had been approved at previous stages by NATO's permanent ambassadors,³³ and only awaited the formality of a ministerial 'rubber stamp', duly accorded to most force goals. The proposal was the result of a decision by the US Congress in December 1985 to authorise the manufacture of chemical weapons (ended by President Nixon in 1968 on certain conditions: first, that the approval of the North Atlantic Council, NATO's highest decision-making body was secured; and second, that contingency plans for the deployment of chemical weapons were agreed with NATO members. On this basis of these conditions, an initial \$167m would be released to start production of chemical weapons on 1 October 1986, but their actual assembly would only begin on 1 October 1987 on condition that no international treaty banning chemical weapons had been agreed, and subject to various guarantees on the safety of handling and storage.

The weapons under consideration were 155mm artillery shells containing mustard nerve gas, and 'big-eye' binary chemical bombs, containing two non-toxic substances which combined to produce lethal VX nerve gas. The reasons cited for manufacturing such weapons were an alleged Soviet build-up of chemical weapons estimated by the US to reach between 200,000 and 700,000 tons; the obsolescence of the existing NATO chemical arms deployed exclusively in West Germany; the enhanced safety in storing binary weapons; and the need to negotiate a ban on chemical weaponry with the Soviet Union from a position of strength.

North-South Monitor

Prior to the meeting, West Germany and Britain had both given their approval of the US's force goal on the basis of certain understandings. An agreement reached during the Tokyo Summit in early May 1986, between President Reagan and Chancellor Kohl of West Germany specified that, unlike the existing weapons, the new arms would be stored in the US until a crisis period of war or transition to war necessitated their transfer to Europe; the old stockpile would be withdrawn from West Germany by the end of 1992; the consent of the West German government would be a prerequisite of their deployment there; and there would be no 'singularity' of deployment, or in other words, West Germany would not be the only NATO country asked to station them. Britain, too, gave its approval on the basis that no binary weapons would be stored in Europe in 'peacetime' (however defined) and none would be deployed in Europe without prior consultations.

The DPC 'took note' as requested of the ambassadors' decision to approve the US force goal. Six members, however, Denmark, Greece, Iceland, Luxembourg, the Netherlands and Norway expressed doubt that such a decision could be taken without unanimity being required, and registered their deep reservations. Only Britain, Canada and West Germany gave their full support, other countries such as Belgium and Italy expressing grave doubts about allowing chemical weapons to be deployed on their own territory even in time of crisis. After the meeting, Caspar Weinberger said that contingency plans for the deployment of binary weapons were now in the process of being formulated. It was not certain, however, whether the US Congress would accept the decision in the DPC as a fulfilment of their original condition, or as indicative of the degree of NATO support which it had been seeking.³⁴

● 'It is the Soviet Union which is at fault in making and stockpiling chemical weapons. It is they who should be asked to stop,' Margaret Thatcher, the British Prime Minister, defending the US decision to recommence the manufacture of chemical weapons. *Financial Times* (London) 24 May 1986.

A NATO decision to approve chemical weapons would send a 'wrong signal at the wrong time' to the Soviet Union. Jaap de Hoop Scheffer, NATO ambassador for the Netherlands, denying that the decision would have a salutary effect on the negotiations for a treaty banning chemical weapons. *The Guardian* (London) 17 May 1986.

'There is a kind of collective memory in Europe about World War I. Gas is considered more of a threat than nuclear weapons,' Johan Jorgen Holst, Defence Minister of Norway, explaining Norway's reservations about the decision. *International Herald Tribune* (Paris) 23 May 1986.

▲ Ministerial Council Meeting Halifax, Nova Scotia, 29-30 May 1986

■ Foreign ministers from NATO's member-countries attended a meeting of the North Atlantic Council dominated by the issues of East-West arms control. Chief among these was the announcement made by US President Reagan on 27 March 1986 concerning the Strategic Arms Limitation Treaty (SALT II) of 1979, which had

North-South Monitor

never been ratified by the US Senate, but to which both sides ostensibly adhered. Alleging Soviet violation of the treaty, President Reagan had said that unless the Soviet Union rectified its transgressions, the US would no longer consider itself bound by it beyond the autumn of 1986. In the meantime, the US proposed to keep within its confines by dismantling two obsolete Poseidon submarines while beginning sea trials on a new Trident submarine, the *Nevada*.

US Secretary of State, George Shultz, defended Reagan's statement during the Council meeting, depicting SALT II as deeply flawed, in that it was obsolete restricting delivery missiles rather than warheads was unrati ed by the US and violated by the Soviet Union. Shultz particularly cited the creation of the Soviet SS-25 missile and the development of a system of coding data emitted by missiles in flight, thereby making them more difficult to track. The US position was apparently however, vociferously criticised by other NATO members, led by Canada, Britain West Germany and France. They were reported to have urged that SALT II be respected until a new arms agreement was concluded, on the basis that even a flawed treaty was better than none. They considered, moreover, that the gesture jeopardised progress in the Geneva arms talks (see above) and in arms control in general. While Shultz acknowledged the considerable criticism levelled against the US position, and his complete isolation amongst the other ministers, there was no apparent move in the US stance. He did, however, reaffirm US support for East-West arms control, and urged the Soviet Union to negotiate 'radical reductions' to replace the flawed SALT II.

The Council agreed to establish a high-level task force on conventional force reductions. Its object was to be the formulation of comprehensive though unspecified proposals for the Mutual and Balanced Force Reduction talks (MBFR) in Vienna, and for the Conference on Confidence- and Security-Building Measures and Disarmament in Europe (CDE) in Stockholm. Its aim was to accelerate both sets of talks, with the object of reaching an agreement in Stockholm by the beginning of September 1986. Its interim report would be presented to the NATO Council in October 1986 and a final report prepared for the December 1986 ministerial meeting in Brussels.³⁵

● SALT II is 'an important component in the process of arms control and we don't want that process to come unravell ed'. Sir Geoffrey Howe, British Foreign Secretary, questioning the US position on the treaty. *International Herald Tribune* (Paris) 31 May - 1 June 1986.

If the US breaks SALT II, 'that would not be endorsed by NATO and certainly not by the government of Canada'. Brian Mulroney, Prime Minister of Canada, before the meeting in Halifax. *The Guardian* (London) 30 May 1986.

WARSAW PACT

▲ Political Consultative Committee Meeting
Budapest, 10-11 June 1986

■ The summit was attended by the leaders of the Warsaw Pact's seven member-

North-South Monitor

countries: Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania and the Soviet Union. The main concern in the final communiqué was with disarmament, in both nuclear and chemical weapons. The summit also issued a statement to NATO member-states and all European countries, proposing a programme of conventional force reductions in Europe.³⁶

The communiqué contained the following proposals with regard to disarmament:

- a mutual US and Soviet moratorium on nuclear testing, and the negotiation of a test ban;
- liquidation of Soviet and US medium-range missiles in Europe, and a freeze on the nuclear arsenals of France and Britain;
- agreements at the bilateral Geneva talks on nuclear and space arms, and continued US observation of the Strategic Arms Limitation Treaty (SALT II);
- elimination of chemical weapons by the year 2000;
- conventional arms and armed forces reductions in Europe and globally;
- effective verification at all stages and in all fields.

In its address to NATO, the summit repeated a proposal first made by the Soviet leader, Mikhail Gorbachev, at the East German Communist Party Congress on 18 April 1986.³⁷ Gorbachev had proposed the enlargement of the zone included in the Vienna talks on Mutual and Balanced Force Reductions (MBFR) to encompass all territory 'from the Atlantic to the Urals'. He had also suggested including tactical nuclear weapons as well as conventional ones, in the purview of the talks. There was some speculation that the proposals for conventional arms reductions were designed to dispel European fears that cuts in the superpowers' nuclear weapons would leave Western Europe exposed to the threat of Soviet conventional military might. There were also proposals for verification, which had traditionally been one of the main obstacles to agreement at the Vienna talks.

The summit proposals included the following:

- NATO and the Warsaw Pact would each withdraw 100,000 to 150,000 troops from Europe over one or two years. The units would be disbanded and their armaments and equipment dismantled;
- The Warsaw Pact would be prepared to reduce its land and tactical air forces in Europe by 25 per cent by 1990 if NATO would do the same. This would entail cuts of around 500,000 men each;
- there should be accompanying cuts in tactical nuclear weapons (of a range of up to 1000 kilometres) stored in Europe. Their warheads would be destroyed;
- an international forum on conventional force cuts, involving European countries, the US and Canada, would be convened, and the MBFR framework broadened to encompass the larger regional area, and all European countries;
- discussion of the initiative could take place at the second stage of the Stockholm Conference on Security- and Confidence-Building Measures and Disarmament in Europe (CDE);
- verification of cuts would be by national technical means and international procedures, including on-site inspection.

Other issues mentioned in the final communiqué were: the forthcoming UN International Conference on Disarmament and Development, which was welcomed; making the Mediterranean a zone of peace; creating an international regime for the safe development of nuclear power, including the creation of a mechanism for

North-South Monitor

prompt warning and supply of information; and enhancing the role of the International Atomic Energy Agency (IAEA).³⁸

● 'I may be wrong, but I think that until now the Americans have been using verification as a bluff . . . It increasingly appears that the United States and some other NATO members no longer have any interest in disarmament agreements.' Vladimir Petrovsky, Soviet Deputy Foreign Minister, present at the meeting. *The Guardian* (London) 12 June 1986.

IMF/WORLD BANK

▲ Intergovernmental Group of 24 (G24)
Special Ministerial Meeting
Buenos Aires, 6 March 1986

■ Finance and economic ministers of the Group of 24 developing countries met for the first time outside their usual schedule of meetings, which are normally immediately before the spring and autumn meetings of the IMF and World Bank. They were meeting at the suggestion of Juan Sourrouille, Argentina's Economic Minister, to assess the 'Baker Plan' on international debt, put forward by US Treasury Secretary, James Baker in Seoul in October 1986,³⁹ and review developments in preparation for the forthcoming spring meetings (see below).

President Raúl Alfonsín, who opened the meeting, said that notwithstanding strenuous adjustment efforts on the part of indebted developing countries, adjustment remained asymmetrical, in the absence of efforts by industrialised countries to coordinate their own policies. The ministers agreed on their criticism of the current *ad hoc* short-term adjustment approach to debt, as inappropriate to the severity of the crisis. While welcoming the Baker Plan, the ministers followed the Cartagena Group of Latin American debtors in qualifying their support.⁴⁰ Though the industrialised countries had recognised the political nature of the debt problem, and the need for growth, the ministers found the initiative insufficient in the face of debtor countries' current problems with declining oil prices and commodity export revenues. They stressed that the capacity to service debts would only improve if the transfer of resources to developing countries were increased and credit flows maintained. In particular, they advocated:

- increased multilateral lending;
- the creation of a new credit facility, or the expansion of the existing compensatory financing facility to alleviate the debt service burden due to historically high real interest rates, and including compensation for short-falls in oil export revenues;
- the reduction of interest rates on existing loans to the large debtor countries, thus endorsing a proposal by Argentina, first made at a Cartagena Group meeting in Punta del Este, Uruguay, in February 1986;⁴¹
- equal status between developed and developing countries within multilateral agencies.

The G24 also proposed that a subcommittee within the IMF and World Bank be established to prepare for an international monetary conference, which would have

North-South Monitor

three basic themes: debt; capital transfers; and monetary reform. On specific means of improving concessionary flows to developing countries, they called for:

- an allocation of Special Drawing Rights (SDRs) of \$25bn–\$30bn in the next year, and a further allocation the following year;
- the terms and conditions of Trust Fund reflows to be the same as those of the original IMF Trust Fund;
- a minimum annual increase in World Bank lending of 6.2 per cent, necessitating a general capital increase for the World Bank;
- a substantial replenishment for the International Development Association (IDA), with no tightening of the conditions of its loans;
- a continued role for regional development banks;
- increased Overseas Development Assistance (ODA) from donor countries.

Regarding earlier reports of the Group of 10 (G10) and the Group of 24 on monetary reform, the ministers expressed disappointment that little progress had been made towards formulating specific proposals.⁴² The G24 suggested that a representative committee of ministers from developed and developing countries be established to follow up the reports. They stressed that it should take decisions by consensus, rather than on the basis of weighted voting.

The G24 was scheduled to meet again in April 1986 in New York (see below).⁴³

● The debt crisis does not result primarily from the domestic policies of debtor countries but from the impact of discriminatory and inflationary policies pursued by a majority of industrial countries on the balance of payments position of developing countries.' President Raúl Alfonsín of Argentina, opening the meeting. *IMF Survey* (Washington DC) 17 March 1986.

'Effective reform of the international monetary system should be discussed in the context of a conference in which debt and the flow of funds to developing nations must be included.' Washington DC

■ The dominant issues at the mid-year meetings of the IMF and World Bank policy-making committees were debt and international economic coordination.

1

North-South Monitor

no agreement could be reached on a new allocation of Special Drawing Rights (SDRs). Both committees, however, endorsed the IMF's creation on 27 March 1986 of a Structural Adjustment Facility (SAF) to provide balance-of-payments assistance to countries eligible for loans from the International Development Association (IDA). The \$3bn facility was formed from IMF Trust Fund reflows, and was to be backed by World Bank funding through IDA. India and China had agreed to refrain from using the facility, despite being eligible to do so on the grounds of their low per capita incomes.⁴⁸

In its own deliberations, the Development Committee⁴⁹ endorsed a major expansion in the size and scope of the World Bank's lending programme, urging the Bank to support growth-oriented adjustment programmes as well as investment projects. The Committee repeated its earlier view that the Bank 'should not be constrained by lack of capital or borrowing authority in meeting future demand', and most members favoured an immediate capital increase for the Bank, though the US remained unenthusiastic. The Development Committee also heard a progress report on the negotiations for the eighth replenishment of the International Development Association (IDA VIII). These negotiations had begun in Paris in January 1986 and continued on 7-8 April 1986 in Washington.⁵⁰ While a majority in the Development Committee favoured a sum of \$12bn for the World Bank's soft loan arm in the period 1987-90, difficulties in the IDA negotiations suggested that the replenishment might be in jeopardy. Japan, currently contributing 18.7 per cent of IDA's funds (compared with 5.19 per cent of the World Bank's capital) was threatening to make its contribution dependent on an increased shareholding in the World Bank, and on consequent increased voting power. It was not known whether such an increase would be forthcoming, but it seemed unlikely that the goal of \$12bn for IDA could be reached if Japan reduced its contribution.⁵¹

THE NORTH

▲ Group of Five (G5)

Meeting of Finance Ministers
Washington DC, 8 April 1986

■ Finance ministers and central bank governors from the Group of Five industrialised countries (Britain, France, Japan, West Germany and the US) held a closed session in the margins of the spring International Monetary Fund and World Bank meetings (see above).

The main subject of the discussions was reported to have been a tentative proposal by the US Treasury Secretary, James Baker, for the increased coordination of economic policies, beyond cooperation on exchange and interest rates, between the members of the group. The proposal was understood to entail the determining of medium-term objectives for each of the industrial economies, in such areas as growth, inflation and external balances, using 'objective indicators' to ascertain the compatibility of these goals, and their consistency with balanced world growth. The US was apparently in favour of the proposal not least as a means of reducing the US's

North-South Monitor

record trade deficit. In this connection, James Baker was also reported to have emphasised the need for Japan and West Germany, with their large trade surpluses, to accelerate domestic growth, if the present pattern of exchange rates was to succeed in redressing global trade imbalances. Japan was equally under pressure from the other governments to allow the yen to appreciate further, and to ease its fiscal policy, as a means of increasing its imports and thus diminishing its trade surplus. While some support was reportedly lent to Baker's suggestion for increased economic policy coordination, notably by the British finance minister, Nigel Lawson, it was uncertain as to how governments could be prevailed upon to alter their policies if they were found to be incompatible. Japan and West Germany were notably sceptical of the proposal.

G5 also seemed likely to initiate another round of concerted cuts in short-term interest rates, though no definite time was suggested for such a round.⁵²

▲ Organisation for Economic Cooperation and Development (OECD)
Thirty-fifth Ministerial Council Meeting
Paris, 17-18 April 1986

■ Finance, foreign and trade ministers from the OECD's twenty-four member countries were presented at their annual meeting with an optimistic forecast for the world economy, following the decline in oil prices. They were unable, however, to resolve deep differences among themselves on two principal issues: economic strategies for Japan and Western Europe; and international trade, particularly in agriculture.

In a major speech to the meeting, US Treasury Secretary James Baker reassessed the prospects for a reduction in the US's record trade deficit. He first recalled the need to stem protectionist pressure within the US by redressing the country's external trade imbalance, as the rationale behind the 'Plaza Pact' of September 1985 on lowering the value of the dollar.⁵³ At the dollar's current rate of value, he continued, the US deficit could not be reduced to what he termed a 'sustainable' level without faster growth in Japan and Western Europe. He therefore urged the adoption of policies in these regions which would contribute to faster expansion of output, in preference to the alternative course of action, further depressing the dollar's value. Baker made clear that he was not advocating an increase in spending as a means of boosting output, but rather a relaxing of restrictive fiscal and monetary policies, including a lowering of taxes and interest rates, as a means of increasing investment, employment and consumer demand. The regions with large trade surpluses, Europe and Japan, however, resisted Baker's pressure to commit themselves to closing what he termed their 'growth gap' with the US. The final OECD communiqué⁵⁴ merely stated their agreement to take account of favourable trends in the world economy to promote stronger growth over the medium term while avoiding the re-kindling of inflation. The ministers did, however, agree to seek to intensify cooperation in eliminating current account imbalances between the principal economies, having promoted exchange rate stability at levels 'better reflecting' economic fundamentals.

North-South Monitor

The Council met amidst growing tensions between the US and the EEC, triggered by the imposition by Spain and Portugal of EEC agricultural tariffs on 1 March 1986, as a condition of entry into the EEC on 1 January 1986. The US estimated that the cost of these tariffs in terms of US farm exports amounted to an annual sum of \$580m. It had consequently threatened to increase its tariffs and introduce quotas on EEC farm exports to the US, unless it was granted compensation, or the measures were removed. On 9 March 1986, the EEC had countered by threatening to retaliate against US farm exports to the EEC. While neither side indicated a softening of position at the meeting, the OECD communiqué acknowledged the shortcomings of domestic agricultural subsidies and protectionism, as inhibiting adjustment, and creating global over-supply. The ministers accepted the urgent need for strenuous efforts to reorient such agricultural policies.

On the subject of a new round of multilateral trade negotiations under the General Agreement on Tariffs and Trade (GATT), the ministers agreed:

- to support the launching of a new round, but without acceding to US requests to specify the date as September 1986;
- to accept, tacitly, the inclusion of agricultural trade on the agenda (though there was no mention of the issue in the final communiqué);
- to seek maximum liberalisation in renegotiating the Multi-Fibre Arrangement (MFA), but without consenting to the inclusion of textiles in a new GATT round. Only a few governments acknowledged the goal of negotiation to be the full application of GATT rules to trade in textiles;
- to seek inclusion of 'trade-related aspects' of foreign direct investment and the protection of intellectual property. This wording was a compromise between the US, which wanted investment and patents and copyrights included unprovisionally under GATT, and the EEC, which warned against overloading the agenda of the new round.

Moves to make mixed credits in export financing more expensive and 'transparent' met with overwhelming opposition, particularly from Japan, and were abandoned.

In a section in the communiqué on relations with developing countries, the ministers emphasised the need for growth-oriented structural adjustment and expanding trade as means of resolving the problem of international debt. Welcoming the 'Baker Plan' on international debt, as a growth-oriented strategy on a case-by-case basis, they referred to the need to improve financing in the developing countries by mobilising domestic savings, stemming capital flight and attracting bank credits and foreign direct investment, which 'should play a more prominent role in future capital flows'. The ministers also recognised a need for the OECD countries to make the external environment more favourable for developing countries, by improving their own growth and adjustment; ensuring freer access to their markets; resuming export-credit cover to countries adopting effective adjustment policies; encouraging new investment in developing countries, and providing adequate financial flows on concessional terms. The plight of sub-Saharan Africa was particularly noted, with recommendations of growth-oriented policy reform, structural adjustment measures and more OECD aid through bilateral and multilateral channels.⁵⁵

● 'What we want to start with the [European] Community is a long-term process to negotiate not only our barriers but our reforms planned for agriculture . . . We

North-South Monitor

desperately need to find a way to resolve the farm dispute before it erupts into some form of open warfare.' James Baker, US Treasury Secretary, at a press conference before the meeting. *International Herald Tribune* (Paris) 18 April 1986.

▲Twelfth Western Economic Summit

Tokyo, 4-6 May 1986

Leaders of the seven major industrialised countries (Britain, Canada, France, Italy, West Germany and the US) held their annual meeting in Tokyo.⁵⁶ They were joined by two EEC representatives: Jacques Delors, of the European Community Commission, and Ruud Lubbers, Prime Minister of the Netherlands, in his capacity as President of the European Council. Meeting in the wake of the US raid on Libya on 14 April 1986 and the accident at the Soviet Union's Chernobyl nuclear reactor on 25 April 1986, their discussions centred initially on political issues, and resulted in two statements and a political declaration. In international economic matters, though the summit was hailed by the US Treasury Secretary, James Baker, as marking the most significant development since the adoption of floating exchange rates in 1973, the leaders left fundamental disagreements unresolved in their final seventeen-point economic declaration.

The summit's joint statement on international terrorism incorporated six measures to be used against states sponsoring terrorist activities.⁵⁷ Of the summit countries, Britain alone had supported the US in its raid on Tripoli, though the EEC had belatedly imposed mild diplomatic sanctions against Libya on 21 April 1986. Despite strong reservations on the part of France and particularly Japan, the US and British leaders were able to secure consensus around a strongly worded declaration which explicitly named Libya as an offending state. The declaration confirmed the leader's condemnation of international terrorism, and deplored the increase in its levels since their last summit in Bonn in 1985.⁵⁸ The leaders pledged to make maximum efforts to combat it, combining national measures with international cooperation, particularly through such organisations as the UN, the International Civil Aviation Organisation (ICAO) and the International Maritime Organisation (IMO). They agreed to intensify their exchange of information on preventing terrorist activities, and specified voluntary measures for use by governments 'in respect of any state which is clearly involved in sponsoring or supporting international terrorism, and in particular of Libya'. These measures, to be applied within the framework of international law and national jurisdictions, were:

- a ban on arms exports;
- restrictions, reductions or closure of diplomatic and other missions;
- denial of entry to terrorist suspects excluded from other summit countries;
- improved extradition procedures;
- stricter immigration and visa controls for nationals of suspect states;
- close bilateral and multilateral cooperation between police and security organisations.

The clause on extradition was considered of particular importance by Britain, which was concerned that the US Senate ratify an Anglo-American treaty facilitating the extradition of Irish terrorist suspects. An initial US request for

North-South Monitor

economic sanctions against terrorist states was soon abandoned, and France and Japan were reported to have questioned the legal competence of the summit to prescribe even the six measures in the statement. Notwithstanding the declaration, France and Japan subsequently restated their objections to US warplanes overflying their territories while on missions similar to the Libyan raid. While the British Foreign Secretary, Sir Geoffrey Howe, voiced his trust that the concerted summit declaration would make such military operations unnecessary in the future, US President Reagan was of the opinion that the statement in no way precluded further unilateral action.⁵⁹

The summit issued a further joint statement on the implications of the Chernobyl nuclear reactor accident.⁶⁰ Extending sympathy and offers of medical and technical assistance to those affected, the leaders reaffirmed their faith in nuclear power as an expanding source of energy. They declared the maintenance of safety and security to be an international responsibility for each country, which should provide prompt and detailed information in the event of any nuclear emergency or accident, particularly with transnational consequences. They urged that an international convention committing governments to exchange information on such events be formulated quickly. While reproaching the Soviet Union for failing to provide information over Chernobyl, they welcomed Soviet willingness to begin discussions with the International Atomic Energy Agency (IAEA).

There was no evidence in the declaration that the Soviet commitment to verifiable arms control was questioned on the basis of its closed response to information on Chernobyl, a link which the British government had apparently hoped to forge. Instead, the political declaration issued at Tokyo, which largely confined itself to a series of incontestable statements of general principle, called on the Soviet Union to 'negotiate positively' at the Geneva talks on Nuclear and Space Weapons.⁶¹ There was speculation that the hardline British attitude to the Soviet Union on arms control issues had been temporarily softened by a letter from the Soviet leader, Mikhail Gorbachev, to Margaret Thatcher, confirming his intention to participate in a second summit with President Reagan. The Soviet Union had previously cancelled a preparatory meeting for the superpower summit, in protest at the US raid on Libya, but the latest message was duly conveyed to President Reagan at the Tokyo summit.

The Tokyo Economic Declaration⁶² included an optimistic assessment of the past economic achievements of the industrialised countries, and of future prospects, given lower inflation and interest rates and the decline in oil prices. Listing continuing problems, however, it advocated the strengthening of 'procedures for effective coordination of international economic policy' with the explicit purposes of promoting non-inflationary growth, market-oriented employment incentives, freer trading and investment, and greater stability in exchange rates. The leaders reaffirmed the need to strengthen international surveillance of the major industrial economies, in cooperation with the International Monetary Fund (IMF). They agreed to review their policy goals and forecasts to determine their compatibility, on the basis of ten 'indicators': GNP growth rates; inflation rates; interest rates; unemployment rates; fiscal deficit ratios; current account balances; trade balances; monetary growth rates; reserves; and exchange rates. These indicators theoretically broadened the scope of international coordination far beyond the initial fields of cooperation in exchange and interest rates, and reinforced tentative agreements

North-South Monitor

towards enhanced coordination and surveillance reached at the spring 1986 World Bank and IMF meetings in Washington DC and the Organisation for Economic Cooperation and Development (OECD) ministerial meeting in April 1986 in Paris (see above). The weakness, however, of the provisions for consequent action suggested differences between the leaders as to the real extent of the coordination they envisaged. The declaration invited the 'Finance Ministers and Central Bankers in conducting multilateral surveillance to make the best efforts to reach an understanding on appropriate remedial measures wherever there are significant deviations from an intended course'. While James Baker, the chief advocate of the scheme, was in favour of the formal international coordination of these aspects of national policy, Britain, West Germany and Japan were understood not to consider themselves bound in their national policies by international targets.

The chief disagreements occurred over exchange rates, and marked the virtual collapse of the consensus on exchange market intervention which had existed since the 'Plaza Pact' on lowering the value of the dollar in September 1985.⁶³ The US, backed by Britain, refused a Japanese plea to support the value of the dollar against the yen, made on the basis that the fall in the dollar had progressed far enough, and now risked pricing Japanese exports out of world markets as the yen rose. West Germany publicly supported the Japanese call for a halt in the slide of the dollar, affirming the belief that the Deutschemark and the yen were currently too high in value, and the two countries' export economies were consequently being damaged. The US interest, on the other hand, was in using the dollar-yen exchange rate as a tool for adjusting the trade imbalance between the US and Japan. The Reagan Administration advocated stimulating the export-oriented economies of Japan and West Germany, to make them more dependent on domestic demand for growth, and more receptive to US exports, thus reducing their trade surpluses and the US record trade deficit. Unable to reach agreement on whether to support or depress the dollar, the leaders merely reaffirmed the commitment made at the Williamsburg Summit in 1983, to intervene in exchange markets 'when to do so would be helpful'. The British finance minister, Nigel Lawson, apparently insisted on the deletion from the declaration of a reference to the desirability of 'predictable' exchange rates.

The summit agreed to the creation of a new 'Group of Seven' (G7) which would include Italy and Canada, the members of the summit resentful of their exclusion from the Group of Five (G5). France, Britain and the EEC were vigorously opposed to the move, for various reasons: the enlargement of the group might make it unwieldy, and decisions would increasingly be taken by the US, West Germany and Japan alone; the EEC's importance would be decreased in international currency talks because the G7 from which it was to be excluded would be taking important monetary decisions; and the division of responsibility between G5, G7 and the Group of Ten (G10) would be uncertain, particularly since G7, unlike G5, comprised only finance ministers not central bank governors and its powers in relation to some countries were therefore dubious. The compromise reached in the Tokyo declaration determined that the G7 would meet in the periods between annual summits and collectively monitor each others' economies with reference to the specified indicators, at least once a year. The G5 would continue as a group, including Canada and Italy when international economic and financial matters affecting them were being discussed.

North-South Monitor

The leaders expressed the belief that their policies would help developing countries in so far as they strengthened the world economy in various ways. They also, however, encouraged those countries to adopt structural adjustment policies themselves, involving measures to mobilise domestic savings, encourage the repatriation of capital, invite foreign investment and promote free trade. The summit agreed specifically to support efforts to diversify the economies of developing countries and increase the amount of product processing in countries heavily dependent on primary product exports. It also endorsed the emphasis placed on private financial flows by the 'Baker Plan' on international debt.⁶⁴ It affirmed the importance of an early and substantial replenishment of the International Development Association (IDA); of a general capital increase for the World Bank (though without reference to its size, and merely 'when appropriate'); of the case-by-case approach to debtor countries, and of closer cooperation between the International Monetary Fund and the World Bank. Offering continued assistance to Africa, the summit stressed the importance of the special facility for sub-Saharan Africa and advocated the early use of the IMF Structural Adjustment Facility (SAF).

The declaration contained a commitment to halt and reverse protectionism and specifically advocated the inclusion in a new round of multilateral trade talks, under the General Agreement on Tariffs and Trade (GATT), of trade in services, intellectual property and foreign direct investment. Concern was expressed for redressing global agricultural surpluses, resulting partly from heavy domestic subsidies, but a move to include agriculture as a desirable issue in a new GATT round was reportedly vetoed by France. Agreement was reached, however, on encouraging studies of farm subsidies by the Organisation for Economic Cooperation and Development (OECD).⁶⁵

The next Western Economic Summit was scheduled for Italy in 1987.

● 'The dollar has fallen by 40 per cent against the yen and by 32 per cent against the D-mark since September. That is enough.' Gerhard Stoltenberg, West Germany's Finance Minister, backing the Japanese call for a halt to the slide in the dollar. *Financial Times* (London) 6 May 1986.

'We prefer to concentrate on ways to enhance international economic cooperation and coordination, rather than talking about intervention.' James Baker, US Treasury Secretary, opposing intervention to alter the value of the dollar. *International Herald Tribune* (Paris) 5 May 1986.

'We can take whatever action is necessary to curb, to stop and punish, if they are successful in a terrorist attempt, those who practise terrorism and the states who back and support it.' US President, Ronald Reagan, affirming after the summit the US right to take unilateral action against those it suspects of international terrorism. *Financial Times* (London) 8 May 1986.

'Verification is absolutely critical to the whole arms control process, and means that verification must be detailed and practicable. The difficulties we have on a civil accident have highlighted that particular point.' Margaret Thatcher, British Prime Minister, urging a link between Chernobyl and East-West arms control which was not taken up in the joint statement on the nuclear accident. *Financial Times* (London) 7 May 1986.

▲ ASEAN (Association of Southeast Asian Nations)

Ministerial Meeting

Nusa Dua, Bali, Indonesia, 29 April 1986

ASEAN-US Meeting

Nusa Dua, Bali, 1 May 1986

■ US President Ronald Reagan, on his way to the Western Economic Summit in Tokyo (see above), held brief talks with foreign ministers from the six ASEAN states (Brunei, Indonesia, Malaysia, Philippines, Singapore and Thailand) following a summit with the meeting's host, President Suharto of Indonesia. The talks were preceded by consultations among ASEAN's foreign ministers and, on 30 April 1986, by bilateral meetings between each of the ministers and the US Secretary of State, George Shultz.

Though intended as a means of briefing President Reagan on ASEAN's hopes for the imminent Western Economic Summit, the talks were to an extent overshadowed by the recent 'Libyan crisis'. The ASEAN states had each individually distanced themselves from the US raids on Libya on 14 April 1986. These moves, though apparently motivated to some degree by concern for ASEAN citizens working in Libya, and by recognition of the predominant Muslim influence in Indonesia, Malaysia and Brunei, had been a source of friction between the US and ASEAN countries. The US administration had explicitly rebuked Thailand for casting a decisive vote for a UN Security Council Resolution condemning the US raids, which would have been carried but for the vetoes of Britain, France and the US.⁶⁹ While none of the ministers reversed their positions in Bali, continuing to withhold their support from the US raids, they were silent on the issue, and went on to endorse Reagan's appeal to be launched in Tokyo, for international action to combat terrorism.

The US-ASEAN talks were dominated by economic and trade issues, ASEAN being the US's fifth largest trading partner, and its ministers having decided at their initial meeting together that their chief concern was with US protectionism.

North-South Monitor

Particular concern was expressed for US restrictions on Southeast Asian textile exports, and the adverse impact of the US Farm Bill subsidising US rice exports, on the economy of Thailand, the world's largest rice exporter. The Indonesian Foreign Minister, Mochtar Kusumaatmadja, suggested in an opening statement that the US should further open its markets to ASEAN products, 'in line with the professed US policy to encourage free trade', and criticised falling levels of US direct investment in Indonesia. The US response, however, was to stress the need for domestic liberalisation, urging measures to create a more favourable environment for foreign capital, the opening of ASEAN's service industries to greater international competition, and stricter enforcement of copyright laws, to prevent the widespread copying of US goods. The ASEAN ministers were understood to have tried to impress upon President Reagan the need to help to revive flagging economic growth in Southeast Asia in order to avert the threat of possible gains by communist and radical Islamic groups, themselves inimical to US interests. This concern, together with appeals on protectionism, oil and commodity price support, and investment, was apparently voiced in a memorandum to President Reagan, to be conveyed to the Tokyo Summit. While a main US theme during the meetings was the Soviet military presence in Southeast Asia and the Pacific region, some ASEAN countries were opposed to what they saw as US attempts to deflect attention from the economic needs of the region. Differences in fact emerged in the strategic perceptions of the US and ASEAN, and among ASEAN members themselves. While Singapore and Thailand were united with the US in viewing the Soviet Union and Vietnam as the greatest threats to regional stability, Indonesia and Malaysia saw these threats as exaggerated, considering China to be more dangerous.

President Reagan expressed support for ASEAN's regional peace initiatives concerning Kampuchea, and was reported to have offered to raise the issue at his next summit with the Soviet leader, Mikhail Gorbachev. He did not, however, endorse the eight-point peace proposal announced in Beijing on 17 March 1986 by the President of the tripartite Coalition Government of Democratic Kampuchea (CGDK), Prince Norodom Sihanouk. This proposal was formally endorsed by the ASEAN ministers at their meeting on 29 April 1986, and advocated a two-phase Vietnamese troop withdrawal, with talks between the CGDK and Heng Samrin, after the first phase, aimed at setting up a four-party interim government in Kampuchea.⁷⁰ The proposal had, however, already been rejected by Vietnam, on the basis that it would not talk to the CGDK, though it would to ASEAN, and the US emphasised the need for the total withdrawal of Vietnamese forces, and for free, UN-supervised Kampuchean elections. Shultz also reaffirmed support for the CGDK, while denouncing the Khmer Rouge, despite ASEAN objections that indulging in such criticism merely played into the hands of Vietnam, increasing the likelihood of its continued presence in Kampuchea.

While predictably little public attention was directed by the US at the host country's human rights record, the Indonesian government's treatment of the foreign press inevitably provoked some comment on its restrictions of human rights and of press freedom. Two Australian journalists travelling with the White House party had first been detained and then deported, in retaliation for the printing of an article in the *Sydney Morning Herald* on 10 April 1986, alleging corruption by Suharto and his relatives. The US raised the issue of human rights violations in East

North-South Monitor

Timor, and addressed a few words of criticism at the Indonesian government, for certain of its restrictive practices. Shultz, however, went on to praise the country's economic record, and relayed assurances from President Suharto that more resources would be spent on the development of East Timor.

In another bilateral meeting, the US reacted coldly to demands for US aid for the Philippines far beyond the \$150m so far promised. Salvador Laurel, the new Philippine Vice-President and Foreign Minister, also called for personal assurances of support from President Reagan, whose commitment to the new regime led by Corazon Aquino he called into question. Shultz, while professing US support for the regime, objected that the US did not have the capacity to fulfil the apparently 'infinite' needs of the Philippine government, and suggested that its first move should be to enact appropriate domestic reforms.⁷¹

The ASEAN ministers decided to hold their third summit in Manila, in July 1987.⁷²

● 'The chances of Muslim fundamentalist groups increasing their support must be taken as a natural consequence of slower growth and less employment,' Lee Kuan Yew, Prime Minister of Singapore, warning of the need to revive economic growth in the region. *International Herald Tribune* (Paris) 26-27 April 1986.

'Communism never came to us in big ships. Big bases and big war ships are manifestations of big power rivalry, whether communist or not. How can you condone Subic and deny Cam Ranh? I feel no threat from either,' Mochtar Kusumaatmadja, Foreign Minister of Indonesia, taking issue with the US emphasis on the Soviet military presence in Southeast Asia, and comparing the US military base in the Philippines with that of the Soviet Union in Vietnam. *International Herald Tribune* (Paris) 30 April 1986.

'When President Suharto came into office there was a great deal of starvation in Indonesia. They're now self-sufficient in rice and I think that's basically a great victory for human rights,' George Shultz, US Secretary of State. *Far East Economic Review* (Hong Kong) 15 May 1986.

SOUTH-SOUTH

▲ Non-Aligned Movement (NAM)

Coordinating Bureau: Ministerial Meeting
New Delhi, 16-20 April 1986

■ The final NAM ministerial meeting before the Non-Aligned summit in Harare in August 1986 was attended by foreign ministers from 100 countries. Also present at the meeting, which issued a political and an economic declaration, were twelve observers and twenty guests.

The meeting was overshadowed by the US raid on Libya on 14 April 1986. A communiqué issued after an emergency session on 15 April 1986 condemned the raid as a 'dastardly, blatant and unprovoked act of aggression', and denounced Britain for its support and collaboration. Declaring its full support for Libya, the session called on the UN Security Council to support the NAM's stance on the raid, and to ensure

North-South Monitor

'full and prompt compensation' for Libya. It also despatched a six-member delegation to Tripoli, to convey the NAM's solidarity with the Libyan people. The conference went on to condemn terrorism in all its manifestations, whether perpetuated by individuals, groups or states. It called on all countries, particularly those in the West, to forbid the recruitment, use, financing, training, transit and directing of mercenaries in various parts of the world. The US was singled out for criticism for its 'immoral and illegal' funding of subversive activities in Nicaragua. At the same time, the declaration pointed out that 'the legitimate struggles by people under colonial and racist regimes and other forms of foreign domination and occupation and of their national liberation movements against their oppressors' could not be equated with terrorism. Specifically mentioned in this context were the liberation movements of South Africa, Namibia and Palestine.

In their economic declaration, the NAM ministers condemned the use of economic measures by some developed countries as a means of exerting political pressure on developing countries. These trade restrictions, blockades, embargoes and sanctions, or the threat of sanctions, were incompatible with the UN Charter, they said. They reaffirmed their commitment to resist such threats. Concern was expressed about widening economic disparities between developed and developing countries, and particularly about the situation in Africa. The ministers agreed in principle to establish a standing ministerial committee of the NAM and other developing countries, to promote and coordinate the North-South economic dialogue, and prepare a common position for the forthcoming ministerial meeting of the GATT in Uruguay in September 1986. The committee was expected to be set up at the NAM summit in Harare. The declaration also advocated the establishment of an international monetary system which would ensure stable exchange rates.

No statement could be agreed on the Gulf War, though a renewed appeal was made to both sides to end the conflict. Even this appeal provoked the Iranian Foreign Minister, Ali Akbar Velayti, to walk out of the meeting, protesting that the appeal had equated the two antagonists, failing to condemn Iraq as the aggressor, and for its use of chemical weapons. He was reported to have said that while Iran would remain an active member of the NAM, the organisation's unity was threatened by its policy of taking decisions by consensus.

In addition, the conference accepted a statement by Argentina that the nuclear non-proliferation regime should not be made a pretext for preventing states from developing peaceful uses of nuclear energy; criticised Western countries for using their financial power in an attempt to weaken the role of the UN; reiterated their urgent call for a political settlement in Afghanistan based on the withdrawal of foreign troops; reaffirmed their belief that the sovereignty of the Falklands/Malvinas lay with Argentina and not Britain; welcomed the Soviet Union's comprehensive proposals for nuclear disarmament, whose objectives and priorities were thought to accord with those of the NAM;⁷³ reaffirmed the principle of outer space as a common heritage of mankind, to be used only for peaceful purposes; and reaffirmed their resolve that Antarctica should not become the object of international disputes, but should remain accessible to all countries.⁷⁴

The conference took note of Nicaragua's request to host the NAM summit in 1989.⁷⁵

has taken the law into its own hands.' Rajiv Gandhi, Prime Minister of India and Chairman of the NAM, commenting on the US raid on Libya. *Financial Times* (London) 16 April 1986.

▲ Arab League

Ministerial Meeting

Fez, Morocco, 30 April–1 May 1986

■ Seventeen foreign ministers from the Arab League's twenty-one member-states attended a meeting at the invitation of King Hassan II of Morocco, to discuss the convening of a summit following the US raids on Libya on 14 April 1986. The four absent members were Bahrain, Lebanon, North Yemen and Syria.

Disagreements occurred over the prospective agenda of the summit. A group of states led by Libya and Syria, and including Algeria, South Yemen and Sudan, wanted the summit to confine itself exclusively to discussion of the US raids. A majority of states, however, including Iraq, Jordan, Morocco and Saudi Arabia, as well as the representative of the Palestine Liberation Organisation (PLO), wished to include 'all aggressions against the Arab nation'. Many of these more 'conservative' Arab states had made no audible response to the US raids. They wished to include on the agenda of the summit a focus on the Gulf War, in which they supported the Arab League member Iraq, as well as consideration of the Palestinian problem and Lebanon's predicament, particularly the fact of continued Israeli control through proxy forces on the southern border. The 'radical' states, supporters of Iran in the Gulf War, were, however, adamantly opposed to its inclusion on the summit agenda, and to the consequent diminution of the importance of the US raids.

The meeting broke up in deadlock, with a brief final communique postponing the convening of a summit until after Ramadan. The attempt to achieve a consensus had apparently not been helped by a Libyan proposal to host the meeting at the oasis of Sabha, rather than its being held in Morocco. It was reported that a majority of Arab League member-countries were still prepared to participate in a summit, but that King Hassan had cancelled his plans to host the meeting. He was said to be unwilling to hold it in the absence of at least minimal consensus among the member-states. There was also speculation that, as a US ally, he would be reluctant to host a meeting in which the key issue on the agenda was likely to be vociferous condemnation of US actions against Libya.⁷⁶

● 'One can say there is general consensus on holding a summit. The only problem is to fix the agenda for that summit.' Abdellatif Filali, Foreign Minister of Morocco, summing up the outcome of the meeting. *International Herald Tribune* (Paris) 3–4 May 1986.

North-South Monitor

▲ Organisation of Petroleum Exporting Countries (OPEC) Reconvened Extraordinary Ministerial Conference Geneva, 15–21 April 1986

■ The seventy-seventh conference of OPEC's thirteen oil ministers reconvened after its session in March 1986⁷⁷ to reconsider the level of OPEC's overall production, and its members' percentage shares. The initial sessions were, however, dominated by discussion of the US raid on Libya on 14 April 1986. A proposal by the Libyan oil minister, Fauzi Shakshouki, for the imposition of an OPEC oil embargo against the US was apparently rejected as an item on the agenda. The majority issued a statement, however, which condemned the attack against an OPEC member-country, and, extending condolences to Libya, expressed concern for the US actions 'which are against international law'.⁷⁸ Ecuador, Gabon, Indonesia, Nigeria and Venezuela while not voting against the statement, abstained on the grounds that a decision would require prior consultations with their governments.

The extraordinary conference had been adjourned for three weeks ostensibly to allow ministers to consult their governments on a proposal by the Indonesian Minister of Mines and Energy, Dr Subroto. The proposal was for an average OPEC output ceiling of 16m barrels per day (b/d) in 1986, reduced to 14.5m b/d in the second quarter. In practice, however, this proposal had already failed to gain support at the March 1986 meeting, and new proposals for output ceilings varied widely from 13m b/d to 18m b/d. The differences reflected the continuation of deep divisions within the organisation. The consensus forming among a majority of ministers was that rather than attempting to fix a low seasonal ceiling for the second quarter of 1986, for which sales commitments had already been made, OPEC should determine a realistic annual level which would be high enough to accommodate the individual quota demands of its members. This view was strongly promoted by Saudi Arabia, Kuwait and the United Arab Emirates (UAE). In their case it signified a continuing commitment to the OPEC decision of December 1985⁷⁹ to concentrate on recapturing a 'fair share' of the global oil market, rather than on restraining OPEC production in order to maintain high oil prices. At the time of the conference, OPEC's output was estimated at 17m–17.5m b/d, in contrast to the official ceiling of 16m b/d, left in abeyance by the new strategy. Crude oil prices, meanwhile, had fallen by over 50 per cent. The proponents of the new approach hoped that the fall in prices as a result of OPEC abandoning its role as residual supplier, would induce non-OPEC producers to restrain their own output in the interests of market stability, thereby creating a 'fairer' distribution of the world oil market.

Poorer and more populous states, however, were proving less patient in the face of the steep decline in prices, and correspondingly in their revenues. The three 'radical' members, Algeria, Iran and Libya, which had all had reservations about the original decision to re-order OPEC's priorities, were now calling for an immediate defence of OPEC's official price of \$28 per barrel, through a sharp reduction in OPEC's output. Iran's proposal was for a ceiling of 13m b/d.

Unable to reach unanimous agreement, the conference decided by a majority of ten to three in favour of increasing OPEC's official production ceiling to 16.7m b/d. In the third quarter of 1986 it would be 16.3m b/d and in the fourth quarter, 17.3m b/d. The majority agreed that actual production would gradually be cut back to these levels, with effect from 1 July 1986. Meanwhile, a ministerial group was to be

North-South Monitor

formed, consisting of Indonesia, Kuwait, Nigeria, Saudi Arabia and Venezuela, to make contact with non-OPEC oil producers, and assess their possible cooperation in restoring the stability of the market. They would then report to the next conference in June 1986 in Brioni. The dissenting countries, Algeria, Iran and Libya, suggested their own alternative ceilings of 14m b/d in the second quarter, 14.5m b/d in the third and 16.8m b/d in the fourth. Dismissing the decision as signifying a continuation of the oil price war, the Iranian oil minister, together with the other dissenting countries, objected that only unanimous OPEC decisions would be considered binding. It was understood, however, that the implementation of the new production limit depended on the agreeing of individual members' quotas, and a decision on that vexed issue was postponed until the Brioni conference.⁸⁰

● 'Great damage has been done to the North Sea's prospects. OPEC's worries about the North Sea may be smaller than they were in the past.' Sheikh al-Khalifa al-Sabah, Kuwait's Oil Minister, expressing confidence in the potential for OPEC/non-OPEC cooperation. *The Guardian* (London) 22 April 1986.

'We are dissociating ourselves from these proposals because these proposals mean the continuation of a price war.' Gholamreza Aghazadeh, Iran's Oil Minister. *The Guardian* (London) 22 April 1986.

'We have sacrificed tremendously . . . I don't think we can go on much longer.' Javier Espinosa Teran, Ecuador's Oil Minister, pointing to the costs of the OPEC 'fair share' strategy. *The Times* (London) 23 April 1986.

▲ OPEC

Meetings of Five OPEC Oil Ministers

Taif, Saudi Arabia 23–25 May 1986

Brioni, 23 June 1986

Seventy-eighth Ministerial Conference

Brioni, Yugoslavia, 25–30 June 1986

■ Oil ministers at OPEC's ordinary conference deliberated on three main issues: price strategy; overall production levels in view of an unexpected increase in demand for OPEC crude and an OPEC production surge in early June 1986 to 18.5m–19m barrels per day (b/d); and individual members' output quotas. Observers attended from Angola, Egypt, Malaysia, Mexico, Norway and Oman.

The conference was presented with a report by a group of five oil ministers from Indonesia, Kuwait, Nigeria, Saudi Arabia and Venezuela, with the addition of the UAE. This group had been formed by OPEC's extraordinary conference in April 1986 (see above) to assess the potential for cooperation with non-OPEC oil producers and to consider OPEC's options accordingly. The group concluded that its contacts with Brunei, Egypt, Guyana, Malaysia, Mexico and Oman suggested a willingness on the part of these non-OPEC countries to cooperate in restraining their production, provided that OPEC did the same by maintaining its output in the fourth quarter of 1986, at around 17.5m b/d. Malaysia had specifically offered to cut its production by 10 per cent if accompanied by OPEC controls, and Norway, in an important development since the last meeting, had suggested that it too would be prepared to cooperate with OPEC to stabilise the market if OPEC adopted a more

North-South Monitor

realistic production policy.⁸¹ This move effectively left Britain, the other key North Sea producer, isolated in its refusal to control production, a fact for which it was sternly criticised at the conference. The group recommended a target price of \$17–\$19 per barrel in an immediate effort to stabilise the market, with the ultimate goal of a return to the official OPEC price of \$28 per barrel only in the 1990s probably after 1995. The group seemed to agree that lower OPEC prices had boosted demand for OPEC oil and restricted the output of non-OPEC competitors more rapidly than had been foreseen. In view of this fact, they thought that the increase in demand for OPEC oil over the next few years would be sufficient to accommodate the quota needs of OPEC's members.⁸²

The conference at Brioni elected a new President, the Nigerian Oil Minister Rilwanu Lukman, to replace Arturo Hernández Grisanti, Venezuela's Oil Minister. A majority of OPEC's thirteen ministers tentatively accepted a target price range of \$17–\$20 per barrel for late 1986, and nine members agreed that the desirable OPEC production ceiling would be 17.4m b/d in the third quarter and 17.9m b/d in the fourth, making an annual average of 17.6m b/d. In view of the increase in demand and possible voluntary cuts by non-OPEC exporters of between 500,000 and 700,000 b/d, they felt that this level would be compatible both with global consumption and the achievement of the target price range by the end of 1986. The members dissenting from this opinion included Algeria, Iran, Libya and also Gabon. They abstained rather than voting against the proposals, however, leading to speculation about a more concessionary posture on the part of the three 'radicals'.

The main problems arose when the conference moved on to consider individual quotas. Algeria and Gabon, which had dissented from the earlier decisions, summarily refused to discuss quotas. Iraq and UAE renewed their demands for huge increases in their own output levels, and Iran repeated its threat to produce two extra barrels for every barrel granted Iraq over its existing quota. In sum, the members' quota demands totalled 20–21m b/d, far beyond the overall output ceiling agreed by the majority. Unable to reach agreement on quotas, the ministers adjourned to consult their respective governments on a confidential proposal by the Indonesian Minister of Mines and Energy, Dr Subroto, for sharing an average OPEC production level of 17.6m b/d. Despite a tentative agreement to restrain production until the next conference, on 28 July 1986 in Geneva, several ministers said that they would limit their output only if others did. The final communiqué announced the revival of a ministerial committee on long-term strategy, consisting of the oil ministers of Algeria, Iraq, Iran, Saudi Arabia and Venezuela, with the addition of Indonesia and Nigeria. It was to consider further means of achieving OPEC's stated goal of retrieving a 'fair' market share.⁸³

● If OPEC nations reach agreement on measures which can stabilise oil prices at a reasonable level, the government will contribute to such price stability, which in turn can ensure secure oil and gas supplies in the future.' Gro Harlem Brundtland, Prime Minister of Norway, to the Norwegian Parliament. *International Herald Tribune* (Paris) 14 May 1986.

'Britain must realise that it is in the same boat as OPEC. It needs high prices.' Rilwanu Lukman, Nigeria's Oil Minister, and newly elected President of OPEC, on the need for Britain to follow Norway in cooperating with OPEC to limit production and maintain high prices. *The Times* (London) 30 June 1986.

North-South Monitor

'If there is a one in a hundred chance to put an end to the extremely visible degradation of OPEC, we will do everything necessary.' Belkacem Nabi, Algeria's Energy Minister, recognising the need to secure agreement within OPEC. *The Guardian* (London) 25 June 1986.

▲ Organisation of Arab Petroleum Exporting Countries (OAPEC)

Thirty-sixth Ministerial Council Meeting

Kuwait, 6 May 1986

■ OAPEC's regular session was attended by four ministers (from Iraq, Kuwait, Saudi Arabia and Syria) and senior oil officials from six countries (Algeria, Bahrain, Libya, Qatar, Tunisia and UAE). It was dominated by financial problems arising as a result of declining oil revenues and consequent budgetary cut-backs.

The major issue at the meeting was the notification of withdrawal from OAPEC, submitted by Tunisia in early February 1986. The reasons cited were Tunisia's inability to meet its financial obligations towards the organisation, and the declining role played by oil in the economy of the country. After discussions before the meeting, however, Tunisia was prevailed upon to withdraw its request, with further consultations planned before the next OAPEC ministerial meeting.

The subject of the persistent failure of Tunisia, Syria and Iraq to maintain their contributions to the organisation was also raised at the meeting, as was non-payment by five other OAPEC states for the current year. This issue, together with a Syrian proposal for drastic cuts in OAPEC's future budgetary allocations, was to be raised at the autumn session of OAPEC. This was to be held in Kuwait on 3 December 1986.⁸⁴

▲ Contadora Group-Lima Support Group-Central American Countries

Meeting of Foreign Ministers

Panama City, 5-7 April 1986

Contadora Group-Central American Countries

Meeting of Deputy Foreign Ministers and Plenipotentiary Representatives

Panama City, 17-18 May 1986

■ Foreign ministers from the Contadora Group (Colombia, Mexico, Panama, Venezuela), its Support Group (Argentina, Brazil, Peru, Uruguay) and the five Central American countries (Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua) were unable to agree a common statement of commitment to negotiations for a Central American Peace and Cooperation Treaty. Their meeting in April 1986, extended for a day in an attempt to resolve deep disagreements, collapsed amid mutual recriminations.

Negotiations for a Central American peace treaty had been suspended in December 1985, until May 1986, to await the outcome of forthcoming elections in Honduras, Guatemala and Costa Rica. At the time of their suspension, the negotiations had failed to resolve two contentious issues: military manoeuvres and

North-South Monitor

arms control.⁸⁵ The meeting in Panama City in April 1986 was convened by the Contadora Group, in a climate of rising hostility within the region, with the intention of breaking the deadlock on those issues before the negotiations resumed.

It became apparent in Panama City, however, that the differences between the positions of Nicaragua and the other four, relatively pro-US Central American countries would persist. Nicaragua's Foreign Minister, Father Miguel d'Escoto Brockman, presented the Nicaraguan case for refusing to sign a treaty to disarm without simultaneous assurances from the US that it would cease to support the anti-Sandinist 'contra' guerrilla war in Nicaragua. He was reported to have said that for Nicaragua to sign a pledge of demilitarisation in the absence of a similar pledge from the US would be suicide. The only peace agreement possible, he said, would be in the 'spirit and framework of the Caraballeda Document'. This document, produced at an earlier Contadora meeting and endorsed by all Central American governments, called for an end to foreign support for irregular forces in the region as an essential part of an integrated peace programme.⁸⁶ Moreover, the Nicaraguan government rejected the US contention that the draft treaty's provisions for 'national reconciliation' necessitated talks between the Sandinist government and the US-backed 'contra' guerrillas. Instead, it called for direct negotiations between Managua and Washington.

The response of the other Central American countries appears to have been to deny the linkage of regional demilitarisation with the cessation of aid to the 'contras', and to claim that Nicaragua's demands fell outside the framework of the Contadora negotiations.⁸⁷ The Contadora countries themselves were, however, unanimous in their opposition to US aid for destabilising forces in the region, and attempted to impress upon three US Democratic Congressmen, present at the meeting, the need to postpone an impending Congressional decision on the granting of \$100m in aid to the 'contras'.⁸⁸ Meanwhile, the Contadora and Support Groups presented the Central American countries with a document supporting intensive negotiations with a view to achieving the signing of the treaty by 6 June 1986. The 'Panama Commitment' was signed by twelve of the ministers present, and not by Nicaragua, which rejected the deadline set unless further concessions were made. The Central American governments were also requested to confirm within eight days their willingness to sign the treaty on 6 June 1986 by which time all had done so, with the exception of Nicaragua.⁸⁹

A first round of resumed negotiations took place in Panama City in May 1986, following a preliminary meeting of Contadora deputy foreign ministers on 2-3 May 1986, which prepared a timetable and strategy for the talks. Attending the negotiations were the Contadora Group's deputy foreign ministers, and plenipotentiary representatives from the Central American countries. Victor Hugo Tinoco, Nicaragua's Deputy Foreign Minister, presented official new proposals on the issues of military manoeuvres and arms control. They included suggestions that:

- the performance of national military exercises should be at least 30km away from the borders of other states' territories, and corresponding notification should be given at least thirty days in advance.
- International military exercises, including those with troops belonging to countries outside the region, must be suspended completely, and no later than thirty days after the signing of the treaty if currently under way.

North-South Monitor

- Limits and controls on the number of offensive weapons should be negotiated to establish a reasonable balance of forces in the area, defined as the size of the offensive military force needed by each state to defend its national territory against an external aggression.
- The purchase of all weapons deemed to be offensive in nature should be suspended for 180 days, except for replacements, ammunition and spare parts for existing equipment.
- Each country would simultaneously give their current inventories of offensive arms to the verification and control commission 30 days after signing the treaty.

The proposals entailed a distinction between offensive and defensive weapons, the latter being free from restrictions, just as the Sandinist militia would be excluded from troop reductions.

These proposals were not formally replied to at the meeting, though they were received with scepticism.⁹⁰

● 'We will not sign anything, we won't hand in one rifle, we will not disarm while the US abundance and shameless assistance to the counter-revolutionaries persists.' Father Miguel d'Escoto Brockman, Foreign Minister of Nicaragua. *The Times* (London) 9 April 1986.

'Nicaragua rejected everything that was presented to it. There is nothing left to talk about.' Rodolfo Castillo Claramount, Vice-President and Foreign Minister of El Salvador. *International Herald Tribune* (Paris) 8 April 1986.

▲ Latin American Summit

San José, Costa Rica, 8-9 May 1986

■ The Latin American Summit was attended by the Presidents of ten countries: Argentina, Colombia, Costa Rica, Ecuador, El Salvador, Guatemala, Honduras, Panama, Peru and Uruguay. Nine heads of state were in San José attending the inauguration on 8 May 1986 of the President-elect of Costa Rica, Oscar Arias Sanchez. Though President Daniel Ortega Saavedra of Nicaragua had been invited, he did not attend, possibly in order to avoid the threat of disturbances by anti-Sandinist Nicaraguans in Costa Rica.

The presidents signed a document covering peace in Central America, and Latin American external debt. It urged the Central American governments to sign the Contadora treaty on 6 June 1986, and advocated the withdrawal of all foreign military forces from the region as soon as possible. On debt, the presidents stated that:

- Latin America and the Caribbean need better conditions in renegotiating their foreign debts;
- international organisations should make their collection procedures more flexible;
- Latin America and the Caribbean must not allow their people's development to be affected by coercive measures.

It was reported that attempts by the Contadora Group to secure guarantees of the principle of non-intervention, in order to encourage the signing of the peace treaty in

North-South Monitor

June 1986, had been frustrated by the Central American countries present. The summit was generally regarded as having failed to lend impetus to the regional peace process.⁹¹

▲ Central American Summit

Esquipulas, Guatemala, 24–25 May 1986

■ Central American presidents met at the invitation of the Guatemalan leader, for their first summit since the Sandinist government came to power in Nicaragua in 1979. Those attending were Oscar Arias Sanchez of Costa Rica, José Napoleón Duarte of El Salvador, Marco Vinicio Cerezo of Guatemala, José Azcona Hoyo of Honduras and Daniel Ortega Saavedra of Nicaragua.

The main achievement of the summit was a formal agreement to create permanent Central American Parliament. According to the 'Declaration of Esquipulas',⁹² signed at the summit, the members of the regional parliament were to be freely elected by direct universal suffrage, within a system of political pluralism. The vice-presidents were to propose within thirty days the creation of a commission which would in turn draft the details of the parliament within ninety days.

The summit's success with regard to the Contadora peace process, to which it was intended to give a fillip, was not so marked. While the presidents recorded their desire to sign the peace treaty, they acknowledged that issues remained to be resolved, including those of military exercises, arms control and verification. The declaration also omitted to mention the Contadora deadline for the signing of the treaty, of 6 June 1986, in tacit recognition of the fact that in view of the impossibility of fulfilling the deadline, postponement would be preferable to jeopardising the entire Contadora process, through showing it to be ignored.

It was reported that the summit contained much discussion on the nature of 'pluralist democracy', with differences being registered on the subject between President Ortega and the other leaders. A phrase referring to the attending presidents as 'freely elected by the will of the majority' was apparently deleted from the draft communiqué at the insistence of Costa Rica, on the basis that the Nicaraguan elections had been dubiously democratic. The change occurred despite the phrase having been approved during a preparatory meeting of the Central American vice-presidents on 5 May 1986 in Guatemala City, leading to speculation that the Costa Rican objection had been prompted by the interim application of US pressure.⁹³

● 'We reject the notion that we should be the field of battle to resolve differences in other parts of the world.' President Vinicio Cerezo of Guatemala, protesting against outside intervention in Central America. *The Times* (London) 26 May 1986

North-South Monitor

▲ Contadora Group-Central American Countries

Meeting of Deputy Foreign Ministers and Plenipotentiary Representatives
Panama City, 27-29 May 1986

Contadora Group-Lima Support Group-Central American Countries

Meeting of Foreign Ministers
Panama City, 6-7 June 1986

■ The thirteen foreign ministers of the Contadora and Support Groups and the Central American countries convened in June 1986 following a second, inconclusive round of negotiations in May 1986. The Contadora countries and the Support Group presented the five Central American foreign ministers with a revised draft treaty on peace and cooperation in Central America, and with the 'Declaration of Panama', containing a series of recommendations on future approaches to the region's problems.⁹⁴

The draft treaty contained an account of the Contadora negotiations over the previous two years, and recorded the residual disagreements over arms control, military exercises and verification. It contained some new proposals, construed as compromises between the positions of Nicaragua on the one hand, and the other Central American countries on the other. It proposed that no country should be disarmed while under military threat, and proposed limiting military strength not equally for all countries, but according to national security needs, size, population, geographical characteristics and military spending relative to Gross National Product (GNP).

The Declaration of Panama included the observations that:

- the latest draft treaty proffered by the Contadora Group would be the last;
- the Contadora Group would wait to be convoked in future by the Central Americans themselves, rather than acting as an independent mediator;
- Central America was now obliged to exercise its own political will in order to adopt decisions regarding the region.

The Contadora Declaration also recommended:

- the departure from the region of foreign forces, and an end to the support of groups seeking to overthrow governments in the region;
- an end to the use of territory in the region as a base for aggression against other countries;
- the prohibition of membership of military or political alliances that threaten peace and security in the region.

The Contadora Group's draft peace treaty was rejected by Costa Rica and El Salvador, whose foreign ministers cited its inadequate verification measures as the reason for dismissing it. Honduras, too, voiced its opposition to the draft. Subsequently, on 21 June 1986, the Nicaraguan government declared its support for the document as a basis for peace in Central America, together with its readiness to sign it.⁹⁵

● The draft treaty 'has no mechanism for verification and control in relation to agreements in the military, political and arms control area'. Madriga Nieto, Foreign Minister of Costa Rica, rejecting the draft. *International Herald Tribune* (Paris) 13 June 1986.

North-South Monitor

'We're going to leave aside the fraternal tutelage of friendly nations that committed themselves to this effort.' Rodolpho Castillo Claramount, Foreign Minister of El Salvador, rejecting the draft treaty, and hinting at the possible abandonment of the Contadora process itself. *The Guardian* (London) 13 June 1986.

▲ Organisation of African Unity (OAU)

Council of Ministers: Fifteenth Extraordinary Session

Addis Ababa, 30-31 March 1986

■ A special session of the OAU Ministerial Council examined and approved a document to be submitted to the Special Session of the UN General Assembly on Africa's Economic and Social Crisis, in May 1986. The document,⁹⁶ formulated by the OAU and the UN Economic Commission for Africa (ECA), contained an analysis of the critical situation in Africa, with a summary of the conclusions and proposals; an analysis of the African Priority Programme for Economic Recovery 1986-1990 (APPER), first adopted at the OAU Summit in Addis Ababa in July 1985;⁹⁷ and synoptic country profiles. (For details of the report and the UN session on Africa, see above.)

Adopting the document, the ministers emphasised the need for concerted efforts to disseminate its contents as widely as possible. Such efforts would help to ensure that it would be understood and accepted at the forthcoming UN Session. Arrangements were made for it to be presented to the meeting of the Non-Aligned Movement (NAM) in New Delhi in April 1986 and to the Western Economic Summit in Tokyo in May 1986. (See above.)

Morocco's position was noted, as it objected to all references in the document to the Saharan Arab Democratic Republic (SADR), on the basis that SADR was not a member of the ECA. OAU representatives stressed, however, that the document was an OAU submission rather than an ECA document.⁹⁸

▲ Communauté Economique de l'Afrique de l'Ouest (CEAO)

Eleventh Summit

Ouagadougou, Burkina Faso, 26-27 March 1986

■ The summit of the francophone Economic Community of West Africa was attended by the heads of state and government of its seven member-states: Benin, Burkina Faso, Ivory Coast, Mali, Mauritania, Niger and Senegal. Also present were the President of Guinea and the Foreign Minister of Togo, as observers.

The eleventh summit had been deferred several times in what was manifestly a turbulent period of CEAO's existence. At the previous summit in Bamako in October 1984, three prominent CEAO officials, Mohamed Diawara, Moussa N'Gom and Moussa Diakite, had been arrested for embezzling a total of CFA Fr6.5bn from FOSIDEC, CEAO's Solidarity and Intervention Fund for the Development of the Community. The course of their trial by a People's

North-South Monitor

Revolutionary Tribunal (PRT) in Burkina Faso coincided with the eleventh summit.⁹⁹ In October 1985, the CEAO was further disrupted by the declaration of its Secretary-General, Driss Keita, as *persona non grata* in Burkina Faso, following his alleged criticism of the revolution there, and his being forced to leave the country where the CEAO secretariat is located. Furthermore, a border dispute between Burkina Faso and Mali had led to the 'Christmas War' in December 1985. The CEAO had, however, managed to effect a cease-fire and to police it with an observer force, through one of its organs, the Non-Aggression and Defence Aid Agreement (ANAD).¹⁰⁰

The summit was presented with a report commissioned by the tenth summit in Bamako, on the management of the CEAO, in the wake of the financial scandal. A team of experts heavily criticised the organisation for its dangerously centralised secretariat, the excessive power associated with some of its posts, the lack of a system of financial controls and the absence of viable management procedures. It was also understood that the Committee's investigation had been obstructed at high levels within the organisation. Though the report was not formally accepted by the summit, the CEAO's outgoing President, Captain Thomas Sankara of Burkina Faso, said that it would be conveyed 'in its essence' to the next summit after further observations and investigations had been made.

According to a final communiqué,¹⁰¹ the summit expressed satisfaction at the course of the trial of the three alleged embezzlers of FOSIDEC funds. It also reviewed various of the CEAO's community projects, agreed to set up a Regional Centre for Commercial Information and Documentation (CRIC) and adopted a protocol, to be annexed to the treaty establishing CEAO, on cooperation in the field of computer science.¹⁰²

Mouïya Did'ahmed Ould Taya, President of Mauritania, became the new CEAO Chairman, and the Mali Minister of Transport and Public Works, Mamadou Haidara, its Secretary-General. The twelfth summit is to be held in Nouakchott, Mauritania, in October 1986.

● 'Our organisation was very sick even if had the deceptive appearance of good health . . . We are now in the post-operation stage . . . still in a fragile convalescence.' Captain Thomas Sankara, President of Burkina Faso and outgoing Chairman of CEAO, commenting on the troubled phase in CEAO's existence. *West Africa* (London) 7 April 1986.

▲ Lusophone African Countries

Sixth Summit

Luanda, Angola, 28–29 April 1986

■ Leaders of the five Portuguese-speaking African countries (Angola, Cape Verde, Guinea-Bissau, Mozambique and São Tomé and Príncipe) concluded their summit by issuing the Luanda Declaration on the situation in Southern Africa, together with a separate final communiqué.

The Luanda Declaration identified the main cause of tension in Southern Africa, characterised by armed violence against Angola and Mozambique, as the Pretoria

North-South Monitor

regime. It referred, in particular, to recent South African sabotage attempts against the Malongo oil installation in Angola, and the attack at Gorongosa in Mozambique, where captured documents provided evidence of South African involvement. These events, the declaration noted, had marked the final demise of the compromise between South Africa on the one hand and Angola and Mozambique on the other, represented by the Nkomati and Lusaka accords of 1984.

The leaders rejected US aspirations to play a mediating role in Namibian independence, on the basis of its support for the Angolan rebel group, UNITA, its attempt to link Cuban troop withdrawal from Angola to Namibian independence, and its having welcomed the UNITA leader, Jonas Savimbi, to Washington DC. They suggested instead, a mediating role for the UN, but awaited with anticipation South Africa's implementation of its recent pledge to fulfil UN Security Council Resolution 435 of 1978, on 1 August 1986.

The summit communiqué described areas in which the leaders wished to intensify cooperation, including the fields of trade, economics, finance, information and health. It also stressed the growing importance of political and diplomatic cooperation and advocated the adoption of Portuguese as a working language of the OAU. The leaders condemned the US raids on Tripoli and Benghazi, affirming their support for Libya, and went on to denounce terrorism, particularly the irresponsibility of states which support and promote it as an instrument of their policies. They also condemned US intervention in Nicaragua, and the rest of Central America. The leaders also affirmed their solidarity with the Polisario Front in Western Sahara, with FRETILIN, the Revolutionary Front for East Timor's Independence, and the Palestine Liberation Organisation (PLO).

The next Lusophone summit was to be held in Maputo, Mozambique in 1987.¹⁰³

▲ Southern African Frontline States (FLS) Summit

Luanda, Angola, 8 April 1986

■ The FLS summit was attended by the Presidents of Angola, Botswana, Mozambique, Tanzania and Zambia and by the Prime Minister of Zimbabwe. Also present were Tom Nkobi, National Treasurer of the African National Congress (ANC) and Sam Nujoma, President of the South West Africa People's Organisation (SWAPO).

The leaders reviewed developments in South Africa and its destabilisation of the neighbouring states. In the light of the recently reported delivery of US Stinger anti-aircraft missiles to Angola's UNITA rebels, they explicitly condemned the US for assisting the South African-backed group. In a communiqué,¹⁰⁴ They said that 'in supporting the apartheid regime and the appendage forces grouped in the so-called UNITA, the American government has lost its credibility as a broker, compromising its role in the process of negotiations leading to the rapid implementation of the UN Security Council Resolution 435/78'. Denouncing the actions of the Reagan Administration as 'gross and inadmissible interference' in Angola's internal affairs which was retarding efforts to achieve peace in the region, they repeated their

North-South Monitor

condemnation of the welcome afforded to the UNITA rebel leader, Jonas Savimbi, in Washington. Resisting the US attempt to place the conflict 'within the framework of East-West confrontation', they reiterated their rejection of any attempt at establishing a 'linkage' between the withdrawal of Cuban troops from Angola, and Namibian independence. Though they noted Pretoria's avowed intent to begin implementing UN Security Council Resolution 435 of 1978, on Namibian independence, on 1 August 1986, they repeated their calls for comprehensive and compulsory economic sanctions against South Africa, as the only means of forcing the regime to conform with international law.¹⁰⁵

▲ Southern African FLS Ministerial Meeting Harare, 20 May 1986

■ Foreign ministers of the FLS met in an emergency session following South Africa's military attacks on the member-states, Botswana, Zambia and Zimbabwe, in May 1986.

Condemning the raids, in which three people were killed, as 'dastardly acts of unprovoked and unwarranted aggression', the ministers made a renewed appeal for mandatory and comprehensive international economic sanctions against Pretoria. The raids, they said, constituted a direct attack on all the FLS, and demonstrated that the South African government had embarked on a 'suicidal path of destruction, violence and death'.¹⁰⁶

▲ Mozambique-Tanzania Summit Maputo, 2-4 May 1986

■ The official visit of President Ali Hassan Mwinyi of Tanzania to Mozambique was his first to any country since he succeeded Julius Nyerere in 1985. According to a final communiqué, President Samora Machel of Mozambique described to the Tanzanian leader Mozambique's efforts to combat the destabilising forces in the country, which he referred to as 'a tool of the Pretoria regime'. The leaders also condemned South Africa for its flagrant violation of the obligations of the Nkomati Accord on Non-Aggression of March 1984. President Mwinyi pledged Tanzania's total and unconditional support for Mozambique in its struggle against the South African-backed rebels.¹⁰⁷

North-South Monitor

▲ Mozambique-Zimbabwe

Summit

Harare, 19 June 1986

■ In a communiqué issued after a meeting between President Samora Machel of Mozambique and Prime Minister Robert Mugabe of Zimbabwe, the African leaders affirmed the need for increased economic and military cooperation between the two countries. They expressed satisfaction with progress made by the Southern African Development Coordination Conference (SADCC) towards the goal of economic independence from South Africa, while agreeing on the importance of further efforts to implement SADCC projects, and in particular to rehabilitate the Limpopo railway line linking southern Zimbabwe with the port of Maputo.¹⁰⁸

North-South Monitor

On the Caraballeda Message for Peace, Security and Democracy in Central America, see **TWQ** 8(3) July 1986, pp 1058-60.

The position on US aid to the 'contras' was made uncertain by the ambivalence of foreign policy signals from the US. In mid-April 1986 a letter to the US Congress from Philip Habib, the US Special Envoy to Central America, understood US commitments entailed by the Contadora Treaty to require 'a cessation of support to irregular forces and/or insurrectional movements from the date of signature', though he added that the US would not feel itself bound to the treaty if Nicaragua were contravening it. But, according to a subsequent White House 'clarification', the ending of aid to the 'contras' would date not from signature of the treaty, but from its implementation, and evidence of its being complied with. **Econ** 31 May 1986; **IHT** 21, 24-5 May 1986.

President Reagan's request for \$100m in military and humanitarian aid to the 'contras' was rejected by the US House of Representatives in March 1986 (though approved by the US Senate on 27 March 1986). While Reagan refused to postpone it, it was subjected to Congressional delaying tactics, and was to be reconsidered in June 1986. **Econ** 19 April 1986; **IHT** 7, 8, 9 April 1986; **G** 7, 8 April 1986; **T** 7, 8, 9 April 1986; **FT** 9 April 1986; **Econ** 12 April 1986; **SWB** ME/8225/iii of 5 April 1986, /8229/iii of 10 April 1986, /8230/D/2 of 11 April 1986, /8231/D/1-2 of 12 April 1986.

Third World Foundation News

South-South II: charting the way forward

The Second Summit of Third World Scholars and Statesmen,
5-8 May 1986, Kuala Lumpur, Malaysia

Cooperation between developing nations could now be entering an exciting new phase after this meeting, sponsored by the Third World Foundation and the Institute of Strategic and International Studies in Malaysia.

World attention was fixed firmly on the Tokyo Summit of leading industrialised nations, which took place at the same time and partly explains the near-total lack of media coverage given to this conference. Meeting at a time of deepening economic crisis and uncertainty for the Third World, the one hundred delegates from twenty-three countries were determined to go far beyond mere rhetoric.

They agreed on concrete measures, including the creation of an Independent Commission to explore the possibilities for the expansion of economic ties between the developing world. The preparatory work to establish the Commission was entrusted to a Steering Group under the chairmanship of YAB Dato' Seri Dr Mahathir Mohamed, Prime Minister of Malaysia.

South Africa was a subject of great concern. The possibility that the Commonwealth Eminent Persons' Group (CEPG) might suggest a framework for negotiations between the leaders of the black majority and the apartheid regime was not discounted. However, the consensus was that Pretoria would spurn all efforts to obtain reasonable settlement through dialogue.

Oliver Tambo, President of the African National Congress (ANC), received the Third World Prize on behalf of Nelson and Winnie Mandela on the first day of the summit.

The South Commission

By far the most important decision taken at the meeting was the establishment of an Independent Commission of the South on Development Issues, whose key objectives are:

- to assess the problems facing the 120 or so developing countries;
- to find solutions and suggest ways of increasing cooperation within the South;
- to strengthen organisations already working for greater cooperation, and to consider the creation of a South Secretariat;
- to raise awareness in developing countries about their circumstances and the challenges facing them.

The terms of reference for the Commission would be established by the Steering Group, but the conference recommended that the Commission should comprise no more than twenty eminent persons of the Third World. These

individuals should serve in their personal capacity, and not as representatives of their governments or institutions. A small Secretariat would service and give administrative support to the Commission.

Delegates were cautiously optimistic about the Commission's chances. Mindful of the failure of similar efforts in the past—especially the Caracas Programme of Action adopted at the Group of 77 meeting in 1981, and the statement on self-reliance issued by the Non-Aligned Movement (NAM) in New Delhi in 1983—no one expected immediate success. There was an awareness that each country had specific and often different concerns, and governments tended to pursue their own national interests to the detriment of the Third World as a whole. Key speakers, including the Commonwealth Secretary-General Shridath Ramphal, believed that the present world crisis should encourage governments to adopt a more sensible and long-term approach. They argued that the collapse of commodity prices, deteriorating terms of trade, rising indebtedness, the threat of increased protectionism by industrialised nations, high interest rates, and volatile exchange rates would galvanise the developing world.

Conference members argued that initial progress might come from greater cooperation at a regional, even sub-regional, level, reflecting both realism and an awareness of the obstacles facing the Commission, but they believed that the unity of the developing countries was not an impossible goal. 'Concerted efforts have to be made to expand inter-regional flows of trade, finance, technology and investment, as well as to strengthen schemes of regional or sub-regional integration and cooperation', read the final statement.

Several matters required urgent attention, including regional preferential trading schemes, payments and credit arrangements, the setting up of a Third World Bank, producer cooperation in central selling agencies, counter-trade, the harmonisation of banking laws, the flow of information, and research training and consultancy. These are among the issues which the Commission will be studying.

The first real test of the initiative was expected to come at the September 1986 meeting of the NAM in Harare. Dr Mahathir hoped to complete a report by this time, outlining the findings of the Steering Group. Only then will it be possible to assess the true significance of the main Kuala Lumpur proposal.

The Third World Prize

Following in the footsteps of Dr Raúl Prebisch, Dr Julius Nyerere and Will Brandt is an unenviable task. But Nelson and Winnie Mandela, the winners of the 1985 Prize, can justifiably claim to have contributed at least as much to the Third World as those distinguished individuals who have also received the \$100,000 award in previous years.

The Prize is funded by an independent endowment and administered by the

Third World Foundation, the prize winner being nominated annually by an independent international selection committee. The Prize recognises outstanding efforts by individuals and groups to Third World development.

ANC leader, Nelson Mandela, a towering figure in the struggle against apartheid, has been serving a life sentence since June 1964, having already been sentenced to five years of hard labour in 1962 for strike incitement. Winnie Mandela, who has battled courageously for many years, had had her passport confiscated and was unable to travel abroad. Oliver Tambo, Mandela's close personal friend and former law colleague, accepted the Prize on the couple's behalf and then delivered the 1986 Third World Lecture, which was published in the July 1986 issue of the *Third World Quarterly*.

Conference papers

The main points of the major contributions to the conference proceedings can be summarised as follows:

1) *For the South, a time to think*, by Shridath Ramphal, which stressed the need for swift action to overcome current problems. Ramphal pointed to the lack of North-South dialogue, and the increasingly uncooperative line taken by industrialised countries. 'Recent American acts of war in the Mediterranean were a dramatic example of this retreat from internationalism and world order', he noted.

2) *South-South cooperation: problems and obstacles*, by Tengku Razaleigh Hamzah, Trade and Industry Minister of Malaysia. Tengku Razaleigh argued for cooperation between regions and sub-regions, which he referred to as 'cellular development', within the existing economic system. He found the ideas of a Third World Bank impractical. 'We still believe and strongly so, that money, market and management of the industrialised North are required for the development of the South, . . . the North-South dialogue, and the old notion of "interdependence" are still valid.'

3) *South-South cooperation: challenge to the political process*, by Michael Manley, former Prime Minister of Jamaica. Manley maintained that cooperation has been held back by dependent and malformed economies, the acceptance of the economic models and theories of developed countries, and divisions left over by colonialism. After listing the advantages of cooperation, he added: 'Success will demand political will; the identification of cadres capable of the necessary planning; the determination to keep the cadres on the job as long as it takes; and public patience during the time which all this takes to implement.'

For Manley, a South Commission should 'develop a new framework of analysis in which costs and benefits are set in a deeper framework of strategic purpose. Of particular importance is the matter of mechanisms through which projects can be identified, feasibilities determined and resources indicated.'

4) *Obstacles to South-South cooperation*, by Dr Gamani Corea, former Secretary-General of UNCTAD. According to Dr Corea, the Third World's problems have been caused by a lack of industrialisation on a global scale, which cannot be solved regionally. He urged that the South must develop by their own initiative and not rely on 'trickle-down' development from the North. 'There is less commitment in the North to the goals of cooperation for development than in the past. The South cannot get a response to its needs by generalised exhortations and resolutions passed in international forums.'

5) *South-South trade and economic cooperation: some notes on future strategy*, by Alister McIntyre, Deputy Secretary-General of UNCTAD. In the light of the GATT talks in 1987, McIntyre emphasised the need for greater financing of trade and investment among developing nations.

He was disappointed at the lack of communication between organisations such as the Group of 77 and other regional bodies. 'The days are probably over for across-the-board schemes of almost universal membership. Each country has to find its own place within the network of cooperation arrangements.'

6) *Opportunities for South-South cooperation*, by Ambassador Farooq Sobhan, High Commissioner of Bangladesh to Malaysia and a former Chairman of the Group of 77. Outlining the difficulties lying ahead for developing countries, Farooq Sobhan warned: 'They may instead prefer to increase their dependency relationships with countries in the North and settle for bilateral arrangements which may provide temporary relief but which in the long run will only increase their vulnerability.'

He blamed governments for the past failures: 'If there is a feeling among governments that South-South cooperation has moved slowly then these same governments should recognise that it is because of their own inactivity and failure to be more responsive to South-South programmes.'

7) *South-South cooperation: challenges and opportunities*, by Dragoslav Avramovic, Economic Adviser to the Bank of Credit and Commerce SA, Luxembourg. Avramovic argued for the continuation of negotiations for a global system of trade preferences, concessions in trade talks with developed nations, central selling organisations, greater mutual trade in primary products, an increased flow of information on investment and trade, wider membership of the recently formed Association of State Trading Organisations of Developing Countries, and preparatory work for a possible World Monetary and Financial Conference.

Conclusion

When the first South-South Conference ended in Beijing in April 1983, it was decided that the three years before the second meeting should be used to examine specific regional issues and problems. This work was done at the conference held in Cartagena (1984) and Harare (1985), and its usefulness

could be seen by the recommendations made at Kuala Lumpur. Real and effective steps were taken towards the development of the Third World.

But the daunting task of establishing the Commission still has to be faced. In the words of the Malaysian *New Straits Times* (9 May 1986): 'Well-meaning efforts have often been grounded on the rocky shores of reality. But, perhaps paradoxically, it is hard reality itself that may be the best guarantor of better chances of success.'

H E Dato Seri Dr Mahathir Mohamad, Prime Minister of Malaysia, delivering the inaugural address. A JOURNAL OF WORLD POLICY

A Publication of the World Policy Institute and the Centre for the Study of Developing Societies

Edited by

Saul H. Mendlovitz (World Policy Institute and Rutgers University Law School) and
Rajni Kothari (Centre for the Study of Developing Societies, Delhi)

ALTERNATIVES provides policy relevant analyses of major global issues and presents paradigms, processes, and strategies for confronting current social problems. Embodying a world order value approach, this quarterly offers an opportunity for far-reaching debate on humane governance at all levels of social organization. Robert Jay Lifton says "ALTERNATIVES has become a valuable tool for forging the global identity our epoch needs." Elise Boulding commends the journal for "encouraging speculative and imaginative thinking about the future, yet staying grounded in present reality and traditional scholarship."

Articles of enduring interest already published on:

LOCAL POLITICS, GLOBAL IMPLICATIONS • Richard Falk explores prospects for democratic governance at the state level • R.B.J. Walker examines some dilemmas of international political theory • Chadwick F. Alger and Saul Mendlovitz report on global implications of grass-roots activism in the United States

MILITARISM • Robert C. Johansen examines policies contributing to a new international security order • Marek Trec outlines U.S. and Soviet military trends • Tamas Szentes on the economic effects of militarism.

DEVELOPMENT THEORY • Soedjatmoko outlines an alternative theory of development • Ivan Illich on delinking peace and development • F.H. Cardoso explores new approaches to social policy in Latin America.

WORLD ORDER • Silvia Brucan calls for a new world authority • Ali A. Mazrui examines the hidden cultural agenda in world order problems • Christine Sylvester compares world order and world system approaches to international relations.

GLOBAL RELATIONS • Johan Galtung explores the effects of Western civilization on Eastern traditions • Garret Hardin offers his view of the human predicament.

PEACE STUDIES • Louis René Beres shows how U.S. nuclear strategy degrades U.S. security • B. Welling Hall evaluates the effectiveness of the antinuclear peace movement.

Published quarterly Founded 1974.

Subscription rates: Individuals \$18/yr, \$28/2 yr, \$40/3 yr, Institutions \$30/yr, \$60/2 yr, \$90/3 yr. Domestic first class add \$6/yr. Outside the USA add \$10/yr airmail. Single copies (Min. order \$10): \$5/individuals, \$10/institutions. ISSN 0304-3754

The Third World in Perspective

H A Reitsma and J M G Kleinpenning

Assen, Netherlands: Van Gorcum. 1985. 446pp. Dfl75

There is no gap so wide as that between those who seek to change the Third World, and those who seek merely to understand it. The search for understanding is a hesitant one, the seekers aware of the variety and complexity of the societies that confront them, still more aware of the range of concepts that previous travellers along the same trail have developed for the purpose, and of how inadequate so many of these have proved. Looking back along the trail, it is easy enough to see where we have gone wrong, much harder to conclude that our mid-1980s perspective represents more than the latest attempt to capture an elusive world in a shifting set of paradigms. The proponents of change, on the other hand, can afford no such hesitation. Doubts about their rightness do not trouble them. Their convictions are clear, their prescriptions incontrovertible, their opponents merely obstructive. The

suspicion that these convictions and prescriptions may be derived from academic models now generally abandoned, or even from the vested interests of their proponents, is not permitted to obtrude.

Two of these books—readily identified by subtitles which counterpoise ‘crisis’ on the one hand to ‘cooperation’ or ‘development’ on the other—are dedicated to change, the other three to understanding. *Global Challenge* is a product of the familiar Brandt stable, though published under the auspices of the Socialist International (a grouping of Western and Third World social democratic parties), rather than the Brandt Commission, and written by SI’s London-based secretariat. Heavily exhortatory in tone, it exemplifies what McKinlay and Little have called the ‘compensatory liberal’ approach to global problems.¹ While liberals of all descriptions share the belief that collaboration between the South and the Western capitalist economies is essential to Third World development, those of the Brandt persuasion insist that constant governmental and intergovernmental regulation is essential to compensate for the injustices of the unregulated market. Accordingly, though the arguments in this book are directed largely against conservative policies in the North, with constant sniping at monetarism, the IMF, and especially the Reagan Administration, it shares many of its opponents’ assumptions about the structure of the global economy. In each case, solutions to the economic problems of the South are to be found by resolving those of the North; but in place of the much criticised ‘trickle-down’ strategy of the market economists, *Global Challenge* proposes what one might call a ‘hand down’ strategy, in which intergovernmental aid replaces transnational investment. The argument between ‘pure’ (or market) and compensatory liberals is then basically a domestic Northern one about how best the industrial capitalist economies should be managed; and, stripped to crude essentials, this volume thus sees the solution to the problems of the South as lying primarily in the election of social democratic governments in the North.

The convenience of this doctrine to its Northern proponents is obvious enough, though their Southern partners would be unwise to assume that social democratic parties in power, faced by inevitable pressures from their domestic constituents, would actually devote the \$100bn a year to global development which they propose. It is no less convenient to Third World leaders who wish both to control their own domestic economies and to benefit from the inflow of aid from the West; and indeed the volume constantly emphasises the need for links between ‘like-minded’ Southern governments and their social democratic Northern mentors. However, the main problem in assessing *Global Challenge*—from any other viewpoint than that of the political interests of its proponents—is that it is not primarily concerned with the Third World at all. Produced by First World writers for First World readers about the policies of

¹ R D McKinlay and R Little, *Global Problems and World Order*, London: Pinter, 1986.

First World states, it reduces the Third World to little more than a walk-on role.

The easiest response might then be simply to welcome it as a contribution to arousing Western sympathies towards the South, while looking elsewhere for both analysis and prescription. Almost by default, however, it assumes a paradigm of Third World development which has come under increasing challenge from both left and right: a paradigm which sees the Third World state and its rulers as the benevolent intermediaries between its own people and the global economy. National (ie, government) control over the economy is assumed to be for the benefit of the people as a whole (in sharp contrast to the exploitative activities of the transnational corporation), and the approach thus favours (p 152) 'a high degree of economic sovereignty'. And since economic sovereignty presupposes all the other apparatus of government, even the obligatory demand for disarmament continues to stress (p 197) 'the rights of sovereign states to defend themselves'.

Yet these assumptions, readily enough accepted twenty or thirty years ago, now have to contend with alternative paradigms which see the Third World state, not as the solution to the problem of underdevelopment, but as a major part of the problem itself: as the means by which Southern governing elites extract resources from the productive sector of their economies (and especially the peasantry) in order to maintain a large, inefficient and often repressive bureaucracy. *Global Challenge* does not merely ignore such alternative paradigms; it positively shirks them. In the discussion of African famine, for example, it rightly points out (p 147) that 'only a fraction of the value of key commodities accrues to producers or farm workers in developing countries', but goes on to blame this on 'the transnational corporations which control their distribution on world markets'. The idea that the state might be to blame is more than it can face, though in fact African produce marketing is overwhelmingly in the hands of governments, which use it to extract a hefty surplus from their peasantries; nor is there any evidence to suggest that socialist regimes are any less extortionate than capitalist ones—on the whole, the opposite is true. Nor can aid, and especially official aid, be regarded in the uncritical light that it receives here; while the promised \$100 billion sounds generous enough from the donors' end, it would be all too likely (in the improbable event of its materialising) to create more problems than it solved for the recipients. Though this volume claims (p 11) to mark 'important new ground in the thinking of the democratic Left, in response to the crisis of the eighties', it is little more than an uncritical revamping of tired ideas, derived from outdated assumptions.

Third World: Development or Crisis? is the outcome of a conference in Penang, bringing together Third World journalists and academics, and—in a booklet of eighty-four pages—can scarcely do more than summarise the consensus of its participants' opinions. Its interest, indeed, lies in its

presentation of the received wisdom of a section of the Third World intelligentsia, and it is contrast with the Eurocentric view presented in *Global Challenge*. While the tone is no less didactic, the emphasis is heavily on dissociation from the North, rather than on cooperation with it; and though transnational companies make equally attractive villains in both volumes there is no assumption here that the governments in power in Northern (and especially Western) states would make any difference. It is, too, much readier than the Brandt volume to recognise the oppression of Third World peoples by their own governments, and more forthright about the need for those people to take action themselves, rather than await the benevolence of the West. Many of its specific proposals would evidently be beneficial—especially heartfelt being those which seek to restore the moral and cultural autonomy of the Third World, and to end such degrading abuses as sexual tourism in Southeast Asia. There is nonetheless a gaping void at the core of the volume arising from a total failure to analyse the bases of underdevelopment, or to propose any strategy to overcome them—a void all too candidly revealed by the proposal (p 77) that 'An appropriate model of development that liberates the Third World from the First World must be evolved.' There is no attempt ever to draw on that range of development strategies—from North Korea on the one hand, to Taiwan on the other—which eastern Asia so tellingly illuminates. Tricky questions are swept firmly under the mat in the interests of group consensus, and blaming the North serves as an easy substitute for any serious attempt to tackle the problems of underdevelopment.

The three remaining books are written, in essence, for students in the First World seeking to understand the Third. Shortest and least ambitious of the three, *Political Change and Underdevelopment* describes and assesses the attempts by (largely Western) academics over the last thirty years to construct theoretical frameworks appropriate to Third World politics. The five core chapters each take a group of theories, in roughly chronological order: the early attempts at conceptualising 'modernisation' and 'development' (how infinitely distant do Almond and Rustow seem now); the adaptation of these concepts to the complexity of actual social interactions in works like the Rudolphs' classic study of caste in India; the 'politics of order' school represented by Huntington and Jose Nun; the dependency approach, here represented mainly by Frank and Wallerstein; and the renewed emphasis on social and political structures within the Third World, notably class formation and the state, which brings the survey to the present day. Clear, competent and unpretentious, this is a model of what such an introductory text should be. Randall and Theobald's assessments are balanced and fair, and although they have no space to go into detail—especially into the different formulations of dependency theories—they can at least indicate where the areas of contention lie. The one thing which they do not provide is the 'introduction to Third World politics' suggested by the subtitle. In writing a brief introduction of this kind.

authors have to choose between an approach based on theories (which of course are only of any value if they can be applied to facts), or one based on facts (which can likewise only be interpreted by drawing on theories). In opting unambiguously for a theoretical approach, Randall and Theobald use occasional case-studies to show how these theories have been applied; but their secondary goal of trying 'to convey something of what Third World politics are actually like' (p viii) necessarily goes by the board.

Both Braveboy-Wagner and Reitsma and Kleinpenning offer thick introductory textbooks on the Third World, the first from the viewpoint of the political scientist, the second from that of the geographer. Put simply, the second is much the better book. *Interpreting the Third World* suffers especially from weaknesses in organisation, which in turn reflect a lack of analytical focus. The two main sections, on 'The Aftermath of Colonialism' and 'Modernisation and Development', serve as little more than ragbag categories, under which to discuss a collection of inadequately related topics. Aspects of domestic politics, for example, crop up under 'the one-party system' in Chapter 2, 'political factors' in Chapter 7 and 'administrative problems' in Chapter 8; bits on international relations are similarly scattered through Chapters 3, 4, 9 and 10. The book is clearly and simply written, with a lot of useful empirical data, and balanced assessments of issues such as the Cuban intervention in the Third World, or the role of foreign aid. But there is no theme or integrating viewpoint, through which the reader can attempt to make sense of the mass of data, and in its absence the presentation tends to fall into a set of discrete chunks, with little idea of how these fit together.

The Third World in Perspective almost entirely ignores the formal political organisation of the Third World. But in concentrating primarily on the division between city and countryside, and secondarily on that between core and periphery, it provides an overview of the Third World which would be valuable to social science students of all disciplines, and not just the geographers for whom it is primarily written. Its conceptual framework is derived from a reasoned critique of the dependency theorists, and its central argument that dependence is due more to inequalities of power than to anything inherent in capitalism as such, is persuasively made. It approaches this argument, moreover, through a solid analysis of the material basis of production, especially in agriculture, which many more explicitly Marxist analyses would so well to emulate. Four case studies of Ethiopia, India, Cuba and Taiwan, provide intriguing slants on the general discussion (the use of Taiwan as a counter to dependency theories is especially interesting) and do much to remind students of the vast diversity which the 'Third World' encompasses. In contrast to much of the current literature, it largely ignores the role of the Third World state itself as a contributory factor to underdevelopment, and also takes a 'traditionalist' approach to the peasantry, seeing peasant attitudes (notably in India and Ethiopia) as frequently obstructive to development, rather than as

embodying the highly rational reaction to local productive circumstances which the currently conventional wisdom would suggest. Specialists will find conclusions to disagree with in their own areas—the statement that ‘since the 1974 coup, not much has changed’ in Ethiopia (p 285), for example, is mind-boggling; but as a general introduction, marked by coherent presentation and reasoned concern, it is admirable.

Interpreting disaster relief

Randolph Kent

International Humanitarian Assistance: Disaster Relief Actions in International Law and Organisation

P Macalister-Smith

Dordrecht, Netherlands: Martinus Nijhoff. 1985. 244pp. £33.00

Imposing Aid: Emergency Assistance to Refugees

Barbara E Harrell-Bond

Oxford: Oxford University Press. 1986. 440pp. £15.00

The world of disaster relief has always had its cyclical fads. A major disaster unleashes popular demonstrations by concerned people anxious to help the afflicted. Journalists stand poised, pens in hand, ready to expose the ostensible strengths and weaknesses of the relief system. Wise commentators propound on the underlying causes of the disaster and the inadvertent consequences of intervention.

And then it all seems to die away. The disaster and the relief response are over. The attentions of the public, the media and the experts are spent. There seems little more to say until the next disaster grips the consciousness of all those various components that comprise the disaster relief community.

Often unnoticed in the ebb and flow of such dramas is the growing number of specialists focusing upon disaster and disaster relief as an unfortunate but nevertheless enduring feature of this planet. More and more, below the surface of the fad, is a bedrock of concerned analysts attempting to explore the nature of disasters and essential prerequisites for effective relief.

This expanding bedrock is evidenced in a variety of ways. An increased number of academic institutions are incorporating disaster topics into political science and development curricula. Research institutes are delving into disaster-related topics which focus upon the problems not only in the developing but also in the developed world. A burgeoning literature ranges

over a widening spectrum of relevant topics, from the micro-dimensions of famine indicators to the macro-dimensions of international responses to relief.

Such trends are important. They reflect the growing realisation that instant sympathy is not in and of itself a solution to the plight of disaster-afflicted peoples. They suggest that disaster myths need to be challenged, that social as well as hard sciences must be part of the professional's kit. Ultimately, they demonstrate an increased awareness that professionalism must replace the random, faddish and haphazard approaches which too often have marked traditional responses to disasters.

If one had any inclination to join this growing band of professionals, there is the inevitable question of what route to take. Of course, one entry point would be through particular areas of expertise. Medicine, nutrition, engineering all offer relevant paths to enter into the world of disasters and disaster relief. However, what few such specialists have as they hone their particular skills to deal with disasters is an understanding of the structures and dynamics of the relief system.

Too often even the most conscientious amongst the emerging bands of relief specialists apply their trades without any sense of the context in which they are working. They are unfamiliar with 'Who's Who' in the relief world; they are uncertain about the entitlements—the internationally recognised legal rights of disaster victims—or the mandates and capabilities of those institutions that proffer relief. Yet, even more fundamental, they frequently reveal a basic lack of understanding about the social and psychological problems created by disasters . . . and disaster relief as well!

Both Macalister-Smith and Harrell-Bond go a long way towards filling the gaps in knowledge which even experts too frequently reveal. Given such gaps even amongst the growing numbers of professionals, how might one fill them? Here is where the two books under review are of particular importance. Macalister-Smith's *International Humanitarian Assistance* provides a sound overview of international laws and institutions relevant in times of disasters. *Imposing Aid* by Barbara Harrell-Bond gives an intensive submersion into the social, psychological and institutional contexts of emergency relief.

In *International Humanitarian Assistance*, Macalister-Smith has been able to incorporate all the major international laws and institutions relevant to disaster relief in one single and relatively short volume—no mean feat in and of itself. For anyone who might despair at the seemingly inadequate international relief network of the 1980s, it is very instructive to be reminded that internationally accepted laws and specialised institutions pertaining to relief are relatively new. While Macalister-Smith rightly points out that humanitarian assistance in one form or another dates back to earliest recorded civilisation, legal frameworks and institution building are little more than a century old. In fact, as the author's excellent 'historical perspective' suggests, the major impetus

really is a phenomenon of the post-World War II period, a phenomenon that intensified from the mid-1960s through the 1970s.

Given such a relatively short gestation period, it is rather impressive to see the full panoply of actors throughout the world that can be regarded as part of the relief network. Here, Macalister-Smith's work is particularly strong. He wends his way through the major international institutions, providing useful descriptions of the work of each, their histories, their responsibilities and the limitations of their mandates. He focuses upon relatively new actors, eg, the European Economic Community, and reminds us of those old-established institutions which most observers overlook, eg, the Sovereign Order of Malta. His analysis of the roles of non-governmental organisations and bilateral donors are insightful, though too succinct. He could well have added to his catalogue the emergence of others such as the Liaison Committee of Voluntary Agencies in Brussels.

Furthermore, the addition of available statistics on bilateral assistance to afflicted nations would have provided a more than useful perspective to the author's rather bland statement: 'The most important contributions to relief operations are frequently made bilaterally.' (p 124) Donor governments' increasing inclinations to provide disaster relief through bilateral channels are not necessarily a happy trend. Humanitarian aid and politics have always been a peculiar though understandable admix. The fact that the balance might be more and more weighted in favour of the political component is perhaps the sort of consideration towards which Macalister-Smith should have alerted the reader.

Despite this comment, the author's cataloguing of relief institutions is well done; so, too, is his overview of the legal framework governing international humanitarian assistance. He has covered a tremendous amount of ground without lapsing into too many 'legalisms'.

Nevertheless, his strength is in compilation rather than analysis, and this leaves open certain areas of frustration. There is no attempt by the author to explain why the present body of international humanitarian law has so many gaps. Institution-building seems to have raced well ahead of international law, and the reasons for this might be apparent to some, but deserve more comment than the author appears willing to provide. In important areas, such as the Doctrine of Humanitarian Intervention, the author could well have offered clearer indications about how this highly contentious issue might and should be handled by the international community.

In his compendium of law, there are other areas which Macalister-Smith could have developed more fully. For example, in discussing the rights of refugees and the obligations of host countries, the Organisation of African Unity's 1969 Convention which goes beyond the restrictive interpretations of the 1951 United Nations Convention should have been explored. There are gaps, too, eg, the 1984 Draft Inter-American Convention to facilitate disaster

assistance. Yet, to point to such gaps or areas which could have been explored more fully is not to condemn this portion of Macalister-Smith's work. The overview of humanitarian law as well as the catalogue of relief institutions are both valuable additions to the literature.

Macalister-Smith's efforts to evaluate the legal and institutional relief system are not as good as his descriptions of either. The evaluation sections which follow at the end of most chapters generally do not broach some of the more fundamental problems that affect the workings of the components of the international relief network. There is little mention, for example, of the 'grey areas'—those overlaps of responsibilities—which more and more find the League of Red Cross Societies and the International Committee of the Red Cross at loggerheads. There is little insight into the organisational issues that complicate the relief process for various institutions: the uncertain mandates, the pressures from donors, the territorial assumptions of relief workers. Nor, except for a fairly standard assessment of the problems which haunted the birth and development of the United Nations Disaster Relief Organisation, are there really any profound points made to explain why inter-agency rivalries amongst the components of the relief system appear to be so prevalent. Without answers to these sorts of questions, Macalister-Smith's hope for more effective coordination of relief and a more progressive international legal framework will never see the light of day.

This said, *International Humanitarian Assistance* is still an important work. While its analysis might never touch the basic issues which hamper the relief network, its description of humanitarian laws and institutions offers a much needed guide—a route map—through the complex relief network.

It is very important for those involved in disaster relief to understand the laws and institutions which frame the relief process. However, without an appreciation of what the relief process does and should achieve, the relevance of such frameworks lacks context. Only too often those involved in providing disaster relief are preoccupied with applying their own particular skills, fulfilling the mandates of their own institutions and protecting institutional interests. Too little time is spent on assessing the impact of assistance upon the only people that ultimately matter—the victims of disasters. Disaster victims—and their social and psychological as well as economic needs—frequently are ignored in the rush to apply what one analyst has called 'natural science-technological fixes'.¹

Preoccupation with technological fixes and with institutional territoriality leads one not only to ignore the real needs of the disaster afflicted but also to perpetuate myths about the causes and attitudes of victims. *Imposing Aid* by Barbara Harrell-Bond offers a powerful demonstration of these very weaknesses in the relief aid system.

¹ Kenneth Hewitt (ed) *Interpretations of Calamity* (Boston: Allen & Unwin 1983), p. 8.

In a carefully researched work, the author has brought the full weight of sociological analysis to bear on the way that the relief process affects refugees. In so doing, she has revealed the potential destructiveness of relief aid itself. 'The fault [of the relief process], writes Harrell-Bond, 'lies with the ideology of compassion, the unconscious paternalism, superiority, the monopoly of moral virtue which is built into it.' (p 363) After spending two six-month periods in the field observing the emergency operations undertaken to assist refugees entering southern Sudan from Uganda, the author clearly can substantiate this all too fundamental failing.

What is most startling about Harrell-Bond's observations is the seeming disinclination of outside relief agencies to communicate with refugees and with local peoples in the host country. Time and time again, relief agencies go about their tasks without really attempting to establish a dialogue with those whom they are supposed to assist. They act as if they are dealing with a species that was functionally different from that of human beings. The skills, the administrative and academic qualifications of so many of the Ugandan refugees in the Sudan typically were ignored as relief workers sought to impose what they felt best for hapless and helpless 'victims' and not necessarily fellow human beings. Similarly, this same condescension was reflected in the ways relief workers dealt with indigenous peoples in the area. Local peoples in so many instances had shown extraordinary generosity in assisting the Ugandan refugees, but only too often relief workers ignored local customs and courtesies as they went about organising relief programmes.

In failing to work with the refugees and local peoples, the well-intentioned efforts of both inter-governmental organisations, ie, the United Nations High Commission for Refugees, and private voluntary agencies, led to what the author describes as 'institutional destruction' on a variety of levels. Refugees with teaching backgrounds, for example, who had volunteered to teach in settlement schools were replaced by fee-paid 'professionals'. Hence, in even this activity as in so many others, self-help was undermined in one fell swoop. Ugandans who had been highly qualified administrators and agricultural experts in their own country were for all intents and purposes brushed aside as agencies put in outside 'experts' who had very limited experience. Once again, relief aid undermined very basic ways to generate a sense of community amongst the refugees.

On both national and international levels, the aid agencies—in proffering their assistance—persistently sought to undercut the very agency which should have been a major participant in the overall refugee emergency programme, viz., the Sudanese Commission for Refugees. 'Instead of recognising the positive role outside organisations could play in strengthening the hand of COMREF in [bureaucratic] "battles", the humanitarians only added another dimension to the problem and took . . . quick advantage of any weakness of the office in its relations with the government.' (p 71)

The institutional destruction which Harrell-Bond ably describes was not necessarily motivated by any inherently evil intentions. To a very significant degree, it reflected some of the myths about refugees and disaster victims that continue to be inculcated in the world of relief aid. Anyone who has been exposed to refugee work in Africa will be only too familiar with the 'pull factor' argument. The pull factor suggests that African refugees are 'pulled' across borders by hand-outs.

However, if one talks to refugees, if one carefully analyses their reasons for fleeing their homes, then the paucity of such paternalistic assumptions becomes readily apparent. The author, basing her research on very intensive surveys, has compiled sufficient evidence to challenge the myth very effectively.

A related myth is that refugees naturally seek to congregate in established refugee settlements. Here, again, Harrell-Bond—by establishing a dialogue with refugees—provides more than adequate evidence that settlements are regarded as the last resort. Only when self-settled refugees finally have no other recourse do they turn to the settlements provided by agencies of goodwill.

The inefficiency of local institutions is but another myth that is perpetuated by too many within the relief establishment. Indeed there are areas of administrative and managerial weaknesses in local institutions such as the Sudanese Commission for Refugees. However, by persistently by-passing or undermining such institutions, the humanitarian instincts and the tremendous potential which such institutions have are never allowed to develop.

What is perhaps most distressing in Harrell-Bond's analysis of the refugee emergency operations in the Sudan is the very simplistic ways that the relief process ignores the very human needs of refugees. More specifically, the psychological paralysis of the refugee is so rarely addressed by ostensibly concerned outsiders. Medicines, food and clothing may all be necessary components of relief, but without sensitivity to the stresses which refugees suffer, humanitarian assistance often compounds the psychological problems of the refugee.

Imposing Aid is a rich and impressive work. The lessons learned, the myths challenged, the perspectives proffered cannot all be included in a single review. The author's analysis of the bureaucratic procedures, the inter-organisational rivalries, the definition of roles amongst the various components of the relief network deserve a much more extensive treatment. One might argue that *Imposing Aid* lacks a certain balance. It is generally very critical of relief agencies, though the criticisms of them are well documented and justifiable. However, perhaps there should be a companion volume in which emergency relief is viewed from the perspective of the relief agencies themselves. Such a volume would most likely not absolve the agencies of the failings to which Harrell-Bond points, but at least it would give greater understanding about why such failings occur.

Even this 'gap' does not fundamentally alter the general conclusion that *Imposing Aid* stands out as a landmark in the growing literature on disasters and disaster relief. It does no less than challenge the very core of the ways that humanitarian assistance is viewed and provided. Ultimately, it reminds us that with all our goodwill and good intentions, we too often forget that we are dealing with human beings. This is the basic message that all who venture into the increasingly professional world of disaster relief must bear in mind.

The politics of Latin America

Peter Calvert

Politics, Policies and Economic Development in Latin America

Edited by Robert Wesson

Stanford, California: Hoover Institution Press, 1984. 262pp. n/p

John A Peeler's *Latin American Democracies* is a genuinely original work that breaks new ground in the study of democracy in Latin America. Some previous writers have largely overlooked the strength of the democratic tradition in Latin America. Others have been inclined to dismiss much of what passes for democracy in Latin America as mere window-dressing. But those previous writers who have sought to examine the reasons for the existence of democracy in the region have made some interesting contributions to the literature. Among these, which may well be less familiar to specialists in other areas of the Third World than they are to Latin Americanists, Peeler notes Samuel P

Huntington, who was influential in rejecting the notion that economic development would of itself in due course lead to stable, liberal democracy; Guillermo O'Donnell, who explained the collapse of democracy and the distinctive emergence of 'bureaucratic-authoritarian regimes' in the Southern Cone in the 1960s and 1970s by the exhaustion of import substitution as a developmental strategy; and Göran Therborn, who in an article in *New Left Review* in 1979 used 'a particularly narrow and formal definition of democracy which has the puzzling effect of excluding both Chile and Costa Rica as full democracies, while including Colombia in that category' (p. 38). Therborn, who regards Costa Rica only as an example of what he terms 'stable non-despotic rule', correctly notes that in no country in Latin America does a combination of international circumstances and local conditions appear to have laid what are generally considered to be the necessary economic conditions for stable democracy. Why then does it exist?

Peeler's research strategy has been to go back to the theoretical literature on liberal democracy and with it as guide to make a case study of the three regimes most widely held to exemplify liberal democracy in present day Latin America: Colombia, Costa Rica and Venezuela. All three regimes have long since outlasted the single presidential term with which they began; all have now facilitated the transfer of political power by popular election from one political party to another and back again, each on several occasions. He finds, firstly, that nothing in the nineteenth-century history of each of these countries serves to distinguish these countries economically from other Latin American states. In each case the emergence of liberal democracy occurred after a transitional period of 'masked hegemony', after which the elites made a significant accommodation with one another to avert chaos and civil war, at a time at which the armed forces were either unable or unwilling to assume the mantle of power.

This emphasis on the agreement to constitute liberal democracy is congruent with the findings of such investigators as Almond *et al.* (1973), Linz and Stepan (1978), and Nordlinger (1981), who insist on the relative autonomy of actors in the political process in determining political outcomes. There is, in sum, little evidence that economic and social conditions have determined the emergence of liberal democracy in these cases, and considerable evidence pointing to the importance of particular political actions (p. 93).

In considering the equally important question of the maintenance of such regimes, Peeler agrees that legitimacy results in part from the successful masking of hegemony in 'pluralist, competitive, strongly centrist political processes'. But it also results from performance: the liberal democracies have performed significantly better than other Latin American regimes. They are less corrupt, inefficient and violent, they have done better in distribution of material benefits to the population, and they have 'also been characterised by considerably more personal security against political violence than is the norm

in Latin America' (p 127). Significantly, however, the elite accommodations arrived at in each of these three cases conform to the norms laid down by the United States. This is but one of a number of factors that lead Peeler to assert that 'there are no sure and easy paths to the further democratisation of liberal democracy' (p 162). He recognises that the maintenance of liberal democracy—however advantageous to the majority of the population—may well be endangered by radicals who believe that by the intensification of contradictions they can achieve a full-blooded social revolution. Yet in his conclusion he suggests that the goal of eliminating possessive individualism and strengthening participatory democracy; in short, the way of life advocated by C. B. Macpherson in his *The Life and Times of Liberal Democracy* (1957) 'is emphatically more democratic than liberal democracy, and comes much closer than liberal democracy to congruence with Iberian traditions' (p 167). What then can be done to achieve this?

Measures that he recommends are: in the economic sphere, the breakup of large corporations, the banning of transnationals, and participatory management; and in the political, 'popular corporatism based in the decentralised and participatory economic system' (p 169). It is hard to see why, given his own clear, succinct and compelling argument for the relative autonomy of the political sphere, the author should at the last succumb to the temptation to underpin participatory democracy by economic measures. Worse still, unfortunately, by the experience of both Mexico (which Peeler does not even recognise as a liberal democracy) and Peru, the cost of such measures in economic terms may be so high as to rule them out of court and the political costs incurred so great as to preclude the long-term survival of the government that implements them. But this is none the less an interesting readable and provocative book which deserves wide readership and careful consideration by all those interested in the future of liberal democracy in the Third World.

Those who wish to go further in their study of Latin America will no doubt wish to have at their elbow a substantial textbook on Latin American politics. The rapidly changing pattern of ideology and conflict, and the historical instability of Latin American regimes, makes it very difficult indeed to produce such a text. In the past two main approaches have been used as alternatives: comparative study of the principal processes and structures across the whole range of Latin American states, and a compendium of country-by-country studies written to a common format. In the first edition of their *Latin American Politics and Development*, published by Houghton Mifflin in 1979, Howard J. Wiarda and Harvey F. Kline combined these two formats, and this revised and updated edition does the same in a substantial but quite manageable hardcover library edition. It is a good introduction and useful (but extremely expensive) reference work, and the editors have drawn on many of the most interesting scholars in the field for the country studies.

Modern publishing techniques certainly make it possible to produce worthwhile books at reasonable prices. *New Social Movements and the State in Latin America* is a collection of articles from a workshop held in October 1983 by the Centrum voor Studie en Documentatie van Latijns Amerika, bringing together the expertise of Western European social scientists in this area.

The papers are broadly grouped under four headings: 'Theoretical departures and delineations', 'Social movements and the city', 'Regions, social conflict and the state' and 'Revolutionary change, popular hegemony and the role of the women's movement'. As will be seen, it interprets the term 'new' somewhat broadly to form a 'highly diverse and multi-faceted list of social movements' reaching beyond the feminist movement, the ecology movement, the peace movement and the anti-nuclear movement, to include a range of cultural phenomena which many might not normally think of as political. As the editor makes clear, this is not accidental. In the post-Marxist context what is being called for is nothing less than a redefinition of the political.

What David Slater sees as different about the new movements can be expressed in three sentences. They constitute, he argues, 'new forms of struggle in relation to new forms of subordination and oppression in late capitalist society'. They reject the 'representation of interests model' and break with the notion of the primacy of the economic. And they stress high levels of participation in decision-making. These theoretical premises are amplified and extended by Ernesto Laclau in a characteristically challenging article on 'New social movements and the plurality of the social', in which he rejects both the position of the social agent in relation to a definable group (i.e. class analysis) and the notion of stages as being relevant to the concept of 'unequal and combined development'.

In the Alice in Wonderland world of developmental theory the flamingoes of the Right are curling up and the hedgehogs of the Left uncurling—and both seem to be changing places. The Left is now urging the primacy of the political; the Right, the primacy of the economic. But the collection of essays edited by Robert Wesson shows how the attempt to keep track of what is going on can lead to unaccountable oddities. The intention is good: to investigate the 'gap between a few rich nations and the many poor to very poor ones' by commissioning a series of essays linking politics, policies, and economic development in several selected Western Hemisphere countries. The authors are distinguished, and a list that comprises Paul E Sigmund on Chile, Gary W Wynia on Argentina, Martin Weinstein on Uruguay, Werner Baer on Brazil, David Scott Palmer on Peru, William Glade on Mexico, Bruce Bagley on Colombia, John D Martz on Venezuela, W Raymond Duncan on Jamaica and the editor himself on Costa Rica is bound to produce much that is interesting and worthwhile. Some of the individual studies are very good indeed.

But where is Cuba? Where indeed? '... Cuba, although unequivocally Latin American, has been omitted because it is too variant to offer useful

comparisons with the other countries.' In what respects? 'It is not a member, for all practical purposes, of the hemispheric trading community; 70 per cent of its foreign trade being with the Soviet Union.' Seventy per cent of Mexico's trade in 1980 was with the United States and that country is included; might the comparison not be instructive? 'The Cuban economy is as politicised as the leadership can make it'—what Latin American economy is not?—'and it is constrained not only by internal planning but by the requirements of the Council for Mutual Economic Assistance, the Soviet bloc economic agency', i.e. they get a stabilised commodity price for their sugar crop. 'The chief pillar of the Cuban economy is the Soviet subsidy equivalent to \$4-5 billion per year'—would this not be an interesting dimension to explore, given the widespread belief in the virtues of economic aid? But no—'The Cuban experience consequently seemed irrelevant for the purposes of this volume.'

Back, then, to the purposes of this volume. The editor takes a moderate position: he believes in democracy, both for its own sake and as the most efficient way of responding to wants and needs. He follows Dumont in disillusion with state-led development in the Third World, but accepts that the arguments for state-led development are 'strong, or at least very persuasive' (Introduction, p xv). So he seeks to investigate alternative models of economic development. But why leave out the one system that is different from all the others? As it is, he has to conclude, rather disappointingly:

The most obvious conclusion to be drawn from the preceding studies is that it is difficult to draw any firm conclusion. The interrelationships of politics and economics even in the relatively limited ambit of Latin America are enormously complex and dependent on numerous factors, internal and external, many of them poorly knowable or unpredictable.

As he rightly says, if the book had been written in 1978 the judgements would have been very different. But there is another moral. Comparison with David Slater's book reveals it: in the field of developmental studies there is a compelling need not simply for country-by-country analysis, nor simply for broad theoretical overview, but for a combination of both. This book is, like the others, a serious and well-founded academic enterprise, and it undoubtedly will be of interest to others concerned with and about the economic development of the Third World. But it could have been more interesting. A Cuba which has voluntarily submitted to an economic regime more severe than anything the IMF has ever dreamt of, which has come to hold up dependence on monoculture as a model to be admired rather than rejected, which has recently urged Nicaragua not to provoke the United States by excessive radicalism and which has, while urging other Latin American states not to do so, quickly come to an accommodation with its own creditors, seems to have something to teach others, even if it is not precisely the lesson that either Left or Right might have thought likely a decade ago.

Nationalisation—A Road to Socialism?

Dianne Bolton

London: Zed Books, 1985. 178pp. £6.50pb

Dianne Bolton's book concentrates on the effects of nationalisation in Tanzania. It shows the different reasons under which nationalisation can occur without any connection to the objective of socialist transformation. Dianne Bolton considers case studies of nationalised sisal estates, partly nationalised estates and those which have remained under private control in the Tanzanian sisal industry.

Dianne Bolton begins chapter one by examining the ideological claim that nationalisation in Tanzania was undertaken as part of a socialist strategy and in the interests of workers and peasants. She explores various theoretical underpinnings of nationalisation. She situates the nationalisation process in Tanzania in a post-colonial setting with regard to the sisal industry. In chapter two she focuses on the actions of politicians, investors, management and labour resulting from nationalisation. But, she first outlines the historical factors relevant for policy formulation with regard to the nationalisation strategy. Chapter three takes up the issue of economic factors which have influenced nationalisation in the sisal industry. She explores the inter-relationships between the problems experienced by the sisal industry due to world market conditions and the structural changes in the sisal industry brought about by nationalisation policies undertaken as a result of Tanzania's ideological commitment to socialism in 1967. Chapters four and five deal with more specific aspects of political change within the sisal industry and consequent economic effects. Dianne Bolton shows how management attitudes and policies can affect the necessity for state subsidy within the industry and describes circumstances under which resources are being dissipated in some estates. Chapter six analyses state labour policy during the post-Arusha period. This chapter documents in a historical setting the stages in the development of worker consciousness and organisation—but Dianne Bolton does not analyse the class character of political ideology but the contradictions arising from questions of participation and control. Chapter seven concludes the book with a note on the transition to socialism.

This is a very important contribution in international labour studies. It is written at a time when the sisal plantations in Tanzania are faced with labour shortages and when previously nationalised firms are being returned to private ownership. Dianne Bolton has argued that nationalisation in Tanzania was undertaken in order that the government might easily remedy the structural imbalances inherited from the colonial period, and that party ideology stressed the importance of counteracting traditional sources of indignity inherent within the management/labour relationship. I agree that Mwongozo Party Guidelines of 1971 was issued as a directive on worker participation in public enterprises but other than the reasons given, I think it was badly interpreted. It was a well intentioned directive, but it never worked to the expectations of the bureaucracy. It created an eroding effect on the minimum level of worker discipline needed for the efficient performance of the public sector. The interaction of Mwongozo in different places of work, particularly in industry, created a permanent conflict between labour and management, thus contradicting the express objective of an efficient management system. Dianne Bolton has argued that nationalisation led to the employment of new management with little experience of the industry. She argues that

this has led to a certain level of inefficiency. This flow of argument tends to take us back in the late 1960s and early 1970s when nationalisation had just been undertaken. It should be noted that some managers are as old as the Arusha Declaration in their current positions. But decisions are often slow and government directives are not implemented as required. Their inefficiency must therefore be explained in terms of their rent-seeking behaviour.

However, the book is quite interesting. The chapters are fairly even with respect to the quality of scholarship and content and the writing style is clear.

Nevertheless the book is quite interesting and on the whole there is much I can agree with Dr Dianne Bolton. The book, distributed by Zed Press in the UK at a price of £6.50 paperback is a justifiable outlay.

The Gulf and the Search for Strategic Stability: Saudi Arabia, the Military Balance in the Gulf, and Trends in the Arab-Israeli Military Balance

Anthony H Cordesman

London: Mansell. 1984. 1041pp. £23.00

Gulf Security into the 1980s: Perceptual and Strategic Dimensions

Edited by Robert B Darius, John W Amos II and Ralph H Magnus

Stanford, California: Hoover Institution Press. 1984. 134pp. £21.50. £8.75pb

US Policy in the Gulf 1968-77: Aftermath of British Withdrawal

Hussein Sirriyeh

London: Ithaca Press. 1984. 297pp. £14.20

These three books are some of the recent additions to the corpus of growing literature on the Gulf area and are mainly concerned with the problem of security. All three examine the issue from a Western perspective and within the context of internal, regional and superpower rivalry.

The Gulf and the Search for Strategic Stability is by far the most comprehensive study published on the security of the Gulf. The author, a US defence adviser with wide experience in the region, is well informed on the multifaceted character of the states and provides a thorough and balanced analysis of the events, supporting this by an impressive wealth of statistics on various aspects of military development in the region. Its subtitle reflects the main contents of the book. The main theme of Cordesman's argument is that the West's security is linked to the security in the Middle East in general and the Gulf in particular. His prescription for the West is, therefore, to establish strategic stability in the area. This is possible through improving its relations with the conservative Gulf states, building up its military capabilities *vis-à-vis* an Islamic revolutionary threat from Iran or an invasion by the Soviet Union, and pressing on for

the resolution of the 'Palestinian problem' as a first step to secure peace between Arabs and the Israelis. These recommendations are sound and may even be supported openly by the local governments. However, this is no guarantee that at 'non-state' level they would be accepted and implemented.

Gulf Security into the 1980s is also a valuable book. The best chapter is that written by Amos. He has successfully applied a theory of conflict to analyse the Gulf war and the broader political problems in the Middle East. Such a theoretical approach has often been absent from the literature. Magnus' chapter on Afghanistan is a welcome addition to the book since that area is usually ignored by other writers. The author illustrates how the Soviet invasion of Afghanistan was related to the political upheavals in the Gulf, namely the overthrow of the Shah in Iran and disturbances in Pakistan following Bhutto's arrest. The chapter on 'US Policy and Gulf Security' is also quite informative. Charles G MacDonald examines the change of 'two pillar' policy after the 1979 Revolution in Iran, and the new challenges for the US in the region.

In contrast, the chapters on 'The Gulf Cooperation Council (GCC) by John Duke Anthony and 'Khomeini's policy in the Middle East' by Robert G Darius are weak in terms of research and analysis. Darius has made little use of primary sources (ie Persian and Arabic materials) while John D Anthony is rather optimistic about the success of the council and tends to ignore its many potential weaknesses. He merely concentrates on the intentions of these states to achieve a degree of security through the GCC. But he mentions neither their political vulnerability nor their practical problems (eg military coordination, compatibility, and interoperability) that such an alliance would present.

US Policy in the Gulf 1968-77 is a brave attempt to produce a book from a PhD thesis and there lies its main weakness. The reader is treated to masses of details which tend to cloud the analysis, and the author's anxiety to document every assertion in the book leads to a situation whereby he is often reduced to a mere narrator. There is no doubt that the topic is well researched, although the author does not offer a new theory or approach in the analysis. According to Dr Sirriyeh, the four major factors which influenced the US policy in the Gulf were: 'maintaining local stability', 'securing access to the Gulf oil', 'superpower rivalry in the Gulf and Indian Ocean', and 'promoting US economic ties with the Gulf.' Iran and Saudi Arabia provided the backbone of security in the area, although, as the author rightly points out, the arms sales to Iran both in terms of quality and quantity far exceeded the ones to Saudi Arabia and other littoral states. In general, Dr Sirriyeh has been successful in relating the US 'two pillar' security concept to those massive arms sales. There are some errors, eg p 15 'Soviet poliev' [Russian policy] and 'Anglo-Russian invasion of Iran in 1941' [Anglo-Soviet]; p 3 and 269, 'Soviet military intervention in Afghanistan in the autumn of 1979' [December 1979]; p 20 'Khorens Abad' [Koram Abad].

To sum up: despite its weaknesses, Sirriyeh's book should not be ignored by the specialists. *Gulf Security into the 1980s* is an important contribution and would benefit students of the Middle Eastern affairs. *The Gulf and the Search for Strategic Stability*, however, is the most scholarly work on the security of the Gulf. It is highly recommended as indispensable reading for all those interested in the area.

Coffee and the Growth of Agrarian Capitalism in Nineteenth Century Puerto Rico

Laird W Bergad

Princeton, New Jersey: Princeton University Press. 1983. 242pp. £23.90. £12.60pb

The twin concepts of 'underdevelopment' and 'dependency', widely employed to explain recent Third World economic history, have, perhaps, enjoyed more theoretical discussion than empirical treatment. This case study of Caribbean development, which traces a familiar story of the integration of a commodity into the world economy, revealing Puerto Rico's shared experience with Latin America, helps to fill the gap. Coffee's slow early progress compared to the more flourishing sugar industry yielded to accelerating development in the 1850s before a bonanza in the last two decades brought impressive growth, land speculation and, for some, great wealth. As usual, the villains in this brief boom were foreign capitalists. Collapsing prices, the American invasion in 1898 and a disastrous hurricane left coffee growers bankrupt, fields untended and *jornaleros* unemployed. The undoubted prosperity of the *edad de oro* barely touched Puerto Rico as Mallorcan merchants, who preferred retirement in Europe to reinvesting profits locally, neither diversified the island's monocultural economy nor provided tangible long-term benefits.

The book's appeal lies also in its use of municipal records which reveal the contrasting roles of *criollo* and immigrant businessmen, the process of capital accumulation, the transformation of the social structure and the pattern of land ownership. Filled with careful research upon local business dynasties, the book skilfully demonstrates familiarity with detail without obscuring its main objectives. The uneven relationship between merchants, with access to credit and information, and up-country farmers is well known but the author revises notions that *hacendados* are unmoved by profit objectives and that a rural proletariat cannot emerge from a traditional society dominated by the *hacienda* and supported by slavery.

Literate and scholarly like all Princeton studies, the book contains helpful maps, clear graphs and enough quantification to satisfy the numerate. Gaps exist, as the author admits, in political analysis and the impact of the disasters of the 1890s. Nor do his conclusions challenge the received wisdom about underdevelopment, dependency and economic dualism. But those seeking evidence in the history of a major commodity from a lesser-known Caribbean island have much to admire in an impressive study which happily avoids polemic in combining macro-judgements with micro-detail.

The Disappeared: Voices From a Secret War

John Simpson and Jana Bennett

London: Robson Books. 1985. 416pp. £12.95

Ruled by three successive military juntas between 1976 and 1983, the Argentine people suffered one of the worst cases of repression in recent history. Organisations such a

BOOK REVIEWS

Amnesty International and the OAS have reported this at length. They were followed by fragmented—usually autobiographical—accounts.

Simpson and Bennett have produced a synthesis which blends the comprehensive view with personal experiences. The book is carefully researched, touching on usually unexplored issues such as the cooperation between paramilitary squads of different Southern Cone countries in the fight against what they considered a widespread subversive conspiracy. Descriptions of cosmopolitan Buenos Aires or the languid provincial towns are very vivid, and the authors have captured the melancholy and yearning for the past which are so quintessentially Argentine.

The book begins with the military coup of March 1976 and ends with the inauguration of Alfonsín in December 1983. As such, it is more a history of the Process of National Reorganisation than a book about 'the disappeared'. Whole chapters are devoted to each of the following: the history of coups in Argentina since 1930, Perón's return to Argentina in 1973, the exploits of Finance Minister Martínez de Hoz and Brigadier Cacciatore, Mayor of Buenos Aires, during the PNR period, the 1983 elections, and the war in the South Atlantic. These might or might not be related to the subject of the book, but the authors fail, with the exception of the 1982 war, to point out the relevance.

Simpson's and Bennett's discussion of the fate of those who were victims of repression is not as thorough as it could have been. By emphasising that few detainees survived, they fail to convey the full irrationality of this evil. A discussion of cases in which people were tortured, eventually released and even allowed to leave the country, or of the different fates suffered by equally innocent husbands and wives, would have shown how ludicrous the whole process was, even from the military's point of view.

Little attention is paid to Massera's demented ESMA project, in which dozens of prominent Montonero cadres were 'recuperated' and put to work as the Admiral's political advisers. The zest with which some of these ex-guerrillas applied themselves to their new tasks, the ensuing marriages between torturers and tortured, and the friendships typical of what has been called the 'Stockholm syndrome,' point to a darker side of human nature which the book misses. According to the authors, 'this book is something of a study in political pathology' (p 9). It is indeed.

Church and Politics in Chile: Challenges to Modern Catholicism

Brian H Smith

Princeton, New Jersey: Princeton University Press. 1983. 383pp. £25.95. £8.50pb

The *Vicaria de Solidaridad* (Vicariate of Solidarity), the human rights agency of the Archdiocese of Santiago is the best-known institution of the Chilean church. It is frequently taken as symbolic of the whole church's opposition to the military government of General Pinochet and its commitment to human rights. The Vicaria is officially limited to Santiago but, like the capital itself, with over 4 million of Chile's 11 million inhabitants, is national in its influence, and is resented by the minority of conservative provincial bishops. It owes its existence to the personal initiative of Cardinal Raul Silva Henríquez who in December 1975 closed down the even more

controversial Peace Committee, an ecumenical agency set up immediately after the military takeover of 11 September 1973 to provide legal assistance to the victims of human rights violations.

Church and Politics in Chile traces the development of the social and political attitudes in the church and among Catholics from 1920 to the present and explains why the setting up of the Vicaria can be seen as a natural development in the Chilean church. The Vicaria was, and still is, a unique institution in Latin America. This uniqueness, however, is the result of the political culture which made Chilean democracy an exception in Latin America up to the military coup. While the attitudes of individual bishops and priests may vary, reflecting a range of political preferences, in general the social attitudes and thinking of the church have paralleled developments in the society as a whole, enabling it through declarations and pastoral letters of the Bishops' Conference to make contemporary and pertinent comments on national issues. Smith uses survey data from Eduardo Hamuy's *Centro de Opinion Publica* from 1958 to 1973 which themselves speak volumes about the confident political pluralism of the capital. The surveys undertaken by religious research institutions are evidence of the concern of the hierarchy to adapt the church to changes in Chilean politics and social life.

Brian Smith makes clear that the Chileans have been fortunate in their bishops. Many bishops present at the Second Vatican Conference, summoned by Pope John XXIII in 1962, remarked on the preparation and teamwork of the Chilean bishops, that gave them an influence out of proportion to their numbers. It is in their willingness to embrace and initiate change, as shown in their welcome for the recommendations of Vatican II and their adaptation to changes in Chilean politics, that the Chilean bishops are remarkable. This reflects a generally easy relationship with their own priests, religious and the laity which is not found in more authoritarian political cultures. The consequence is a church with traditional authority structures, still very priest-centred, but where authority has to be exercised with flexibility and a range of options tolerated within the church.

These changes were facilitated by the emergence in the 1940s and rise to power in the 1960s of the Christian Democrat party (PDC) which influenced and was influenced by the social thinking of the church. The Chilean Christian Democrat party was reformist and technocratic in its approach. Its founders were members of the Conservative party who rejected its reactionary stance on all social issues, especially land reform. There is a marked streak of anti-communism in the party and among its supporters, especially the middle class for whom it has a strong appeal. With the failure of the Frei administration (1964-70) in its latter years to revitalise Chile's flagging economy and its unwillingness to extend or deepen its reforms, there was growing political polarisation. The right, which had supported Frei in 1964 in order to prevent an Allende victory, reorganised, merging the Liberal and Conservative parties, to form the National Party. The PDC itself split, with a minority faction, including most of the youth, forming a left-wing movement which became a member of Popular Unity. The bishops retreated from their close association with the PDC while maintaining their support for reforms, preparing the way for a relationship of cordial neutrality with the Allende government.

In the last months of the Allende administration, a time of permanent crisis, the bishops continued to press for a constitutional civilian solution, in spite of private doubts about its viability. Smith's survey data show that a majority of all bishops, priests and nuns thought that a coup was inevitable. The bishops acknowledged that, apart from an

educational reform (*Escuela Nacional Unificada*—ENU), there was no threat to religious freedom under the Allende government, though there were fears about what might happen in the future, when the transition to socialism was fully realised. These fears were expressed in a pastoral letter published in September 1975 in which the bishops thanked the military for 'freeing' Chile 'from a Marxist dictatorship which appeared inevitable and would have been irreversible', a judgement for which, as Smith points out, there is no factual basis. The inclusion of this statement was the product of pressure from conservative bishops. Nevertheless it also corresponds to the beliefs of the leading Christian Democrat figures who had been ministers in the Frei government, though by that time the hopes that the military would remove Allende and the Marxist threat and then hand over power to a constitutional—and Christian Democrat—government, had long been demolished by Pinochet.

The years of dictatorship have brought about a rapprochement between the church and the Christian Democrats, as the latter have established themselves as the largest party waiting in the wings to take over from the Pinochet government. The left, still led by people active in politics before the coup, is deeply divided about the lessons which should be drawn from the failure of Popular Unity and the compromises that should, or should not, be made in order to achieve an orderly transition to democracy. Cardinal Fresno, who took over from Cardinal Silva as Archbishop of Santiago in 1983, was responsible for drawing party leaders together in 1985 to seek agreement on a democratic alternative. The result was the National Accord, published in September 1985, in which the Christian Democrats, together with smaller centre-left and right-wing groups, played a major part.

There will be further declarations and initiatives by the Chilean bishops before the military dictatorship gives way to a democratic and civilian government. An overwhelming majority of Chileans want a return to democracy and we can expect their bishops and priests, all of whom were brought up in the vigorous pluralist culture that prevailed before the coup, actively to encourage such change, while at the same time preaching the reconciliation which has been a constant theme in their pastoral letters since 1970. The church has earned the respect of all but determined supporters of the military government through its defence of human rights and its practical solidarity with the poor. There is still great nervousness about Marxism and its adherents, which has increased in Santiago-based church institutions since Cardinal Fresno took over from Cardinal Silva. The church institutions which have provided a shelter for critical thought, human rights work, grass-roots organisation and simple survival—the *Academia de Humanismo Cristiano*, *Vicaria de Solidaridad*, *Vicaria de Pastoral Obrera* and the workshops and soup-kitchens dependent on the zonal vicariates, remain timidly pluralist, but there is an anxiety on the part of the hierarchy that civil society should find a way of organising itself outside church premises. The beneficiaries often reciprocate these feelings but are only too well aware of the dangers and difficulties of independent organisation.

GEORGE GELBER

Catholic Institute of International Relations

Institutional Reform and Economic Development in the Chinese Countryside

Edited by Keith Griffin

London: Macmillan, 1984. 336pp. £25.00. £8.95pb

This group of papers is the product of a field study in China in Summer 1982, and participants have provided a great deal of useful and rare information and data, particular case studies of rural units down to sub-village level. However, they come work on China not as China specialists, but as a group of very experienced development economists, and this brings out one of the problems of the book: it is never quite introductory enough for general readers, but nor is it as sharply focused on dispute about rural economic systems as would benefit a discussion of the recent upsets in the Chinese system. It is a pity the disputes between the participants, which surface at times are not made much more explicit. The value of market forces and financial incentives opposed to attempts at collectivisation are part of crucial debates about China's new policies and their relevance (or not) for the rest of the Third World. Bringing the conflicts much more to the forefront of these authors' reactions to China would probably have made the book of more lasting value, given the perpetual problem of studying China—things happening so quickly that information is soon out of date.

Two of the most telling aspects of this are i) the rapid virtual privatisation of major rural industrial and service enterprises in the years since their visit (though the trend ought to have been noticed and commented on even then), and ii) the much more widespread development of rural wage-labour. These two factors alone are sufficient to undermine much of the wishful thinking about the new responsibility system presented in Griffin's analysis (jointly with Kimberly Griffin in the crucial chapter 2), which suggests (in contrast with the Chinese government's own desire!) that the responsibility system is likely to be more egalitarian than the work-points earned in the communes before they were abolished in 1982. As soon as rural entrepreneurs enter the Griffins' idealised scene, and even farmers begin employing wage-labour, the official desire to see 'some get rich first' should be sounding loud alarms. In fact Khan (p 110) does dispute important aspects of the Griffins' views, and at one point suggests that data carefully analysed by them (concerning distributed collective income) are meaningless.

Some of the information provided is of restricted value for another reason: the field studies were conducted in a few localities in two provinces. One in the south-west, Yunnan—is an area peopled by a significant number of non-Han 'national minorities' whose rural economy is hardly representative of the major Han regions. This is not to dismiss its value as information—such studies are hard to come by. The other, Sichuan—is mainly Han and much more representative of key aspects of the dominant economy, and a much better choice. It is useful too in that its provincial government experimented with the 'reforms' before other parts of the country, so it is indicative of what has developed elsewhere.

While much of the book deals in one way or another with the post-1967 introduction of the responsibility system in agriculture (in which practically all land and major enterprises have been contracted out to individuals or families who now operate on their own), there is a division of labour between the contributors (based on their individual expertise) which tends to create divisions in the treatment of agriculture on the one hand and (rural industrial) enterprises on the other. Lee is best at avoiding this in his use

and less opinionated chapter on employment and incomes. Enos provides data and assessment of pricing and planning policies in regard to rural industry, but does not link these issues to the income distribution and employment questions.

It is curious that Griffin's analysis (given his sensitivities to the exploitation of Third World peasants) is not better keyed in to the trends in China's economy towards commoditisation and market mechanisms, especially since these have also created personal control of very significant segments of the rural means of production (and hence individual/family expropriation of surplus). As well as Khan, we find that Ghose (on rural strategies) and Saith (on the one child family population policy) are more critical than Griffin of the social inequalities inherent in the reforms. Perhaps the crucial question is not whether the new policies are egalitarian, but whether China's new and rapid economic growth is going to produce net increases in economic (and social) welfare from all inhabitants in the not too distant future, despite current increasing inequalities.

Refugees and Development

Edited by Ernest E Boesch and Armin M F Goldschmidt

Baden-Baden: Nomos Verlagsgesellschaft. 1983. 140pp. np.

Tradition and Dynamism among Afghan Refugees: A Report on Income-generating Activities for Afghan Refugees in Pakistan

Geneva: International Labour Office. 1983. 174pp. £5.70pb

These two books, whilst written from different points of view, on two different levels, are indications of the fact that in this century the dramatic social phenomenon of forced migration has given rise to a totally new field of academic and non-academic research—refugee studies. Development of scholarly interest in this multi-disciplinary field is something that should be encouraged, not only in the interest of refugees, but also in the interest of the host countries which tend to be some of the poorest in the world. Today, these Third World countries are affected by flows of refugees which add further problems to those already existing and which still await solution.

The first publication attempts to discuss the problem from the more general theoretical view, leaving aside individual cases: it was the outcome of an international conference organised by the Development Policy Forum of the German Foundation for International Development (DSE) in consultation with the United Nations High Commissioner for Refugees (UNHCR), held in West Berlin, 13–17 September 1982. The conference brought together—for the first time—senior officials from African and Asian host countries to exchange experiences and discuss problems and solutions.

The most valuable chapters are concerned with proposing a programme for future research and give the final conclusions of the conference. We learn among other things that to prevent refugee studies from becoming over-academic and without relevance to practical refugee work, the planning and implementing agencies should be closely involved in these studies.

The second book is much more specific. It focuses on the case of the Afghans who constitute the biggest refugee problem in the world. The report shows us how theory could become practice. It was written by the participants of a mission organised by the International Labour Office (ILO) in Geneva in response to a request received from the UNHCR in consultation with the Government of Pakistan. The major objective of the mission was to make suggestions regarding long-term solutions for the Afghan refugees in Baluchistan and the North West Frontier Province. The mission gives some clear-cut conclusions and recommendations on income-generating activities which are considered a very important instrument in furthering greater self-reliance. The design of the proposed project rightly take into account the predominant social, cultural and economical features of this highly heterogenous population. It points out that the training programme should be designed to upgrade the basic traditional skills of the refugees as well as to introduce some new modern skills on which the refugees themselves lay much emphasis and which would be useful to them not only now, in and around the camps, but also on return to their country. A totally innovative feature of the proposed training programme seems to be the use of mobile training units to reach the more remote and outlying refugee areas as well as to ensure maximum flexibility in terms of the content and duration of courses.

I also recommend that the reader pays attention to the annex on conversations with refugees. These excerpts give a valuable insight into Afghan refugees' camp life.

The major fault of the study is the very short period of time which the mission devoted to field visits (only three weeks) and the statement 'at least two hours were spent in each village'. Also the number and selection of Afghan refugee villages as 'representative' is unsatisfactory since the deciding criteria was that of relatively easy access to them.

'What should we do?' is an unwritten question which emerges from the pages of both books.

Oxford*

The Church in Brazil—The Politics of Religion

Thomas C Bruneau

Austin, Texas: University of Texas Press, 1982. 235pp. £22.95

In his book *The Church in Brazil*, Professor Thomas C Bruneau presents a fascinating case study of the history and recent development of the church in a country where 90 per cent of the population of 120 million are said to be Roman Catholic.

The author has undertaken the daunting task of attempting to integrate an analysis of the Church as institution with an investigation into religious beliefs and practices, whilst at the same time examining the Church at both national and diocesan levels. Most importantly the book also looks at the growth and development of Basic Christian Communities (BCCs) in Brazil. This grass-roots movement is seen by many people as one of the most significant developments in the modern Catholic Church.

A brief historical review outlines the way in which the Church has always played an important role in Brazilian society. Beginning with discovery and colonisation, which is

described 'as a joint endeavour of the Portuguese Crown and the Catholic Church', the author goes on to explain the integration of church with state and society at all levels. Bruneau contends that despite the assumption that as a result the Church 'enjoyed a monopoly over religious belief and practice', in fact a situation was established whereby the institution has had little influence over 'a dispersed population in a huge country.' A consequence of this is that even though adherence to Catholicism was obligatory 'religion for most of the population evolved independently of the church'. This, in part, explains the variety of popular religious practices and beliefs, including, for example the various flourishing spiritist movements and cults. It also helps to explain why recently Protestant sects have been able to take root relatively easily.

At the same time, the type of popular religiosity which was promoted by the Church acted as a 'pacifying agent' and this coupled with the historical integration of Church and State has 'fostered tremendous stability and continuity in Brazilian society and politics'.

The book goes on to trace the later history of the Church through Republicanism and disestablishment and analyses the way in which the Brazilian Church gradually forged closer links with the Vatican, developing, at the same time, a Western European orientation which was inappropriate for 'rural underdeveloped Brazil'. Later co-option by the Vargas regime in the 1930s and the adoption of a pastoral strategy directed towards the middle and upper classes served to reinforce a system where the rural and urban poor were largely ignored by the institutional Church. This situation was to last until after the end of World War II and the development of what Bruneau calls 'Brazil's pre-Revolution'.

During the period 1950-1964 rapid changes were taking place in Brazilian society. Increasing industrialisation and urbanisation together with rising expectations for a different kind of political system drew the Church more and more into active involvement with the promotion of structural change in Brazil. This radically different approach was articulated chiefly through the National Conference of Brazilian Bishops (CNBB), which was founded in 1952, and the very important lay movement Catholic Action. In describing the development of this new role for the Church the author argues that a major reason was the realisation for the first time, by the Brazilian bishops, of the lack of real influence of the institutional Church on the majority of the Brazilian people. Since the military coup of 1964 this new orientation of the Church has been consolidated and strengthened, albeit unevenly. As a consequence, privileges have been relentlessly withdrawn by the state and church personnel have been repressed.

Bruneau argues that current Church strategies can only be understood in relation to the nature of the state as it developed after 1964; he therefore devotes a chapter to *The Brazilian Regime 1964-1980*. He believes that as the Church's critical role became further refined, especially since the Second Vatican Council and the historic Conference of Latin American Bishops at Medellin, Colombia in 1968, 'the Church has become the primary institutional focus of dissidence in the country'. He further believes that it was the repressive nature of the regime itself which 'forced this role on the Church' and that in choosing to assist those sectors 'seeking their liberation' the church 'acts prophetically' and is in a way providing 'a counter-model' to that developed by the military. Signs of this 'prophecy' are to be found in the creation of special national church groups to deal with specific issues, eg human rights, land, Indians. Although there is not complete unanimity among the Bishops there is sufficient agreement to enable the CNBB to regularly issue important public statements, especially since the

mid 1970s. At the diocesan level, however, the Church does not implement national policy evenly and the author analyses this aspect very effectively through the findings of a survey carried out in eight dioceses, with varying degrees of commitment to the Church's new strategy. He concludes that those dioceses that 'fall in line do so for essentially the same reasons that caused the national church to change'.

The last part of the book deals with the development and growth in Brazil of Basic Christian Communities (BCCs). These communities, which are replacing old parish structures, are vigorously promoted by the CNBB. Bruneau argues that even at what is described as 'this rudimentary stage' the BCCs (or CEBs) 'hold clear implications for the nature of religion, church structures and processes and change in the larger society: for religion because they base their work on the Bible and are communally, rather than individually, oriented; for the church because they bring the institution closer to the Brazilian reality and oblige both clergy and laity to face concrete concerns; and for the larger society because they provide a model or nucleus for participation and an impetus for other groups to take root and assume roles in the larger society and polity.'

The author concludes that the church 'is not going to bring on "the revolution" singlehandedly.' However, by the promotion of change the church is assisting a 'more general process' and is 'defining a role and position for itself fully consistent with the radical roots of the Gospel message so often voiced but so seldom carried forward.'

In an epilogue to the book, the 1980 Papal visit to Brazil is described and commented on. During the visit the Pope specifically supported the CNBB, progressive bishops and the BCCs. The Pope's words and actions are interpreted by the author as providing 'unambiguous support for the progressive socio-political orientation of the Brazilian church.'

Bruneau has provided a valuable and perceptive analysis of the processes which have been taking place in the Brazilian church in recent years. Since the book was published the military have given way to a civilian regime (a fact which Bruneau believed beforehand would provide an important test of the durability of the new pastoral options of the institutional church). The controversy over the Theology of Liberation has sharpened inside the church and Rome has intervened directly in the Brazilian church with the temporary silencing of the theologian Father Leonardo Boff. The championing of Father Boff by the institutional church in the persons of Cardinals Arn and Lorscheider (who accompanied him to his investigation in Rome) and the fact that there has been no visible stepping back from the commitment to the poor encourages the belief that the process described so ably by the author is likely to continue.

The impact and consequences of these development in the largest Roman Catholic country in the world, on the universal church, are as yet not fully clear. It may be that when they are understood the results could be momentous indeed.

Transnational Corporations versus the State: The Political Economy of the Mexican Auto Industry

Edited by Douglas C Bennett and Kenneth E Sharpe

Princeton, New Jersey: Princeton University Press. 1985. 300pp. £30.20. £7.20pb

The sub-title of this book, 'The political economy of the Mexican auto industry', denotes the clear intention of the authors to provide a much broader view of the development of the Mexican auto industry than that provided by a narrow focus on bargaining between the state and multinationals. By situating bargaining relations within the context of the international economy and by broadening the bargaining perspective to include discussion of what issues the opposing sides raise or fail to raise and why, the authors hope to provide 'a historical-structural method that is neither deterministic nor voluntaristic.' (p 4)

It is not clear that the analysis in the main part of the volume can bear the weight of such pretensions. The core of the book is six chapters which analyse three successive stages of bargaining between the Mexican state and the auto multinationals (in the early 1960s, late 1960s and late 1970s), and the outcome of the agreements reached in terms of the auto industry's development. The bargaining accounts show Bennett and Sharpe at *their best*. Empirically, they provide a considerable degree of detail about the plans, proposals, compromises and consequences of each of the three stages of bargaining, starting with the original shift to local production in the early 1960s and then moving on to the redirection to export promotion in the late 1960s and also in the late 1970s. The authors clearly have considerable knowledge of both the industry's development and the way bargaining between the multinationals and the state took place. Theoretically, too, the bargaining chapters incorporate the perspectives which arose out of political science debates on power, considering not only the bargaining which actually took place, but also the items that did not reach the agenda because of agreement between the parties or an acceptance by one party or the other that the issue could not be won.

Alongside these chapters, the wider perspective of the world economy, dependency and state formation sit somewhat uneasily. The opening chapters fade into the background, and wider considerations only pop up occasionally. The impression remains that they have been grafted on to the bargaining perspective, and a lot of the more general material clearly has not received the same degree of first-hand investigative attention as the bargaining elements. The material on the international auto industry is adequate but not original, and the chapter on the Mexican state does not give enough information on capital accumulation in Mexico. In the end, one is left with a good, well-researched book on bargaining between the state and the multinationals, which makes some attempt to problematise the state as an actor and an effort to locate firm strategies within the context of the changing international auto industry. At this level, Bennett and Sharpe provide sound and comprehensive scholarship.

JOHN HUMPHREY

University of Liverpool

The Growth of Manufacturing Industry in Tanzania: An Economic History

M S Silver

Boulder, Colorado: Westview Press, 1984. 322pp. £25.00

This book outlines the various features of the development of manufacturing industry in mainland Tanzania since the colonial period up to the early 1970s. Considering its size and its poor quality of print, this book distributed in the UK by Bowker Publishing Company at a price of £25 is quite expensive. However, the book is quite useful and important for an analysis of Tanzania's future development. It is this aspect which makes the reaction of the reviewer one of sheer delight.

M Silver sets himself an important task of evaluating the manufacturing sector stage by stage since the colonial period. He does this in order to identify the constraints operating on Tanzania's potential development. His major argument in chapter one is that the manufacturing sector in Tanzania emerged almost as an appendage of colonial government emphasis on a few agricultural and mineral commodities. This is facilitated by an analysis of the development of the agricultural sector and the considerable amount of investment in infrastructure and how this in turn led to major developments in agriculture and—subsequently—to processing industries. Exports at that time were concentrated around the processing of export-oriented agricultural produce and basic food manufacturing. Silver argues correctly that this export trade which was tied to the economic infrastructure was largely instigated by the colonial government at a considerable social and economic cost to the indigenous population. Chapter two discusses the state of the economy at independence in 1961. He concludes that the economy was predominantly agricultural and the few consumer goods industries which were established during the colonial period continued to receive emphasis even after independence catering for a minority few. Chapter three forms the heart of the book. It presents the growth of production of manufacturing industry during the post-independence period up to 1972. He shows that between 1962-65 there was an increase in the number of manufacturing establishments providing consumer and industrial goods and services relative to other manufacturing establishments. But the country's economic development strategy continued to be one that presented an attractive investment climate with tax incentives and cheap labour since most major resources were to come from abroad. After 1965, there was a shift in emphasis from the manufacturing sector's reliance on food processing and cotton ginning industries to modern manufacturing such as oil refining, cement, machinery and the spinning weaving and finishing of textile goods. Chapter four identifies trends in employment and labour productivity in the manufacturing sector while chapter five examines the changes which took place in average earnings within the manufacturing sector over the period. The major focus of the chapter is that output per employee increased at an overall slower rate than earnings per employee. In other words, the potential for self-generating growth in Tanzanian manufacturing was restricted by the low growth in labour productivity relative to the growth in earnings per employee. Chapter six examines in detail how the surplus generated in industry was being used for capital formation. His main observation is that growth in capital formation was relatively low. Most surplus was generated by parastatals which were created after 1967 and financed from local sources. Chapter seven looks at the ownership of manufacturing production

BOOK REVIEWS

particularly after the nationalisation measures of 1967 following the Arusha Declaration. Chapter eight examines the question of regional distribution of manufacturing firms and income inequality, while chapter nine concludes the book.

Silver's stage-by-stage documentation of the major developments of the Tanzanian manufacturing sector since 1884 attributes the rapid growth in production and employment to the high rates of investment in a small number of relatively large establishments primarily in the parastatal sector. Bearing in mind that this book written in the 1980s when there is widespread disillusionment about parastatals in Tanzania and about import substitution industrialisation in the rest of the Third World countries with these kind of measures, one would have expected a clear analysis of the major weakness(es) of the Tanzanian industrial sector. This is important from the viewpoint of policy analysis. The book contains no policy recommendations as to the future of the manufacturing sector in Tanzania. By 1972 enormous manufacturing capacities had been created. Silver mentions quite tangentially about the foreign exchange problem facing the industrial sector for buying raw materials, spare parts and machinery. In Tanzania, it was expected that the growth of the manufacturing sector would be faster than the rest of the economy. But the manufacturing sector created in Tanzania is import-intensive and by implication, this means that the growth of the manufacturing sector means that the demand for imports has had to grow rapidly. However, the supply of foreign exchange in Tanzania is generated by the agricultural sector which has been growing more slowly. This trend of analysis would have shown that after some point, the growth in demand for imports would exceed the supply of exports leaving the manufacturing sector foreign exchange constrained. It is this type of analysis which would have formed an important part of the book's policy recommendation for any future development programmes to be undertaken in the Tanzania manufacturing sector.

Nevertheless, the book is a useful contribution to the available stock of knowledge about Tanzania's development process. Mistakes such as: 'the effects of economics and diseconomics of scale' which, I believe, should read: 'the effects of *economics* and *diseconomics* of scale' (p 169) etc. need to be corrected.

The Making of Foreign Policy in China: Structure and Process

A Doak Barnett

London: I B Tauris. 1985. 173pp. £16.95

Japan and the Developing Countries

Edited by Kazushi Ohkawa and Gustav Ranis

Oxford: Basil Blackwell. 1985. 456pp. £17.50

East Asia contains a remarkable range of states, from wealthy Japan, through the

booming newly industrialised countries to the poorest Southeast Asians such as Laos. Comparisons between patterns of development within the area, and with other developing states further afield, is an academic growth area that often brings together scholars from economic history, politics, sociology and international relations. The two books under review are examples of the best in current research.

Doak Barnett is one of America's longest serving and most sensible sinologists. His brief monograph—the first serious analysis of the making of China's foreign policy—will only reinforce his reputation. It is based on primary research, including high-level interviews in China in the summer of 1984. To a certain extent, Barnett is a captive of his sources; for example, he places great store by his interview with Premier Zhao Ziyang and the current Chinese pretence to 'free and frank' exchanges of ideas. Virtually no information is provided on the espionage and dirty tricks side of Chinese foreign policy, nor the special *ad hoc* arrangements for crisis management. Significant portions of biographical information are already out of date, and the description of bureaucracies does not help us to understand why Chinese foreign policy has shifted so wildly in the past thirty-five years.

But it would be churlish to harp on the problems in a book that clearly breaks important new ground. The detailed assessment of how the Chinese foreign policy bureaucracies run will be deeply appreciated by all students of China. They will not be surprised with Barnett's conclusions that China's foreign policy is becoming more technocratic, systematic and professional. His belief that the locus of power has shifted from the Standing Committee of the Politburo to the Secretariat and State Council is of interest, but will probably not convince the specialist. One can only hope that the 'open door' that allowed Barnett to undertake this initial survey will allow successors to follow with more complete analyses.

No such limits on sources hinder the editors and contributors to the other book under review. It is the result of a joint project by Yale University's Economic Growth Center and the International Development Centre of Japan which attempted to uncover what part of Japan's development experience was relevant to developing countries.

The detailed chapters are too complex to be adequately covered in a review, but the superb introduction by the editors covers the ground in summary. The range of issues assessed is impressive, resulting in persuasive conclusions in most cases. The most salient points include the emphasis on cultural dimensions of policy, the complex components of a sensible development strategy, and the relative unimportance of the external environment. For example, detailed analysis suggests that Japan's development was made much easier by the fact that the modernising samurai came from a class with few vested interests to lose. Also, land-saving techniques such as improved rice yields were more important than the attempt to extend cultivation into ever more marginal areas.

The contributors also make much of the need for flexible financial sectors to make the best use of saving and investment. Realistic interest rates unhindered by ceilings may hurt the ruling elite's supporters in the cities, but they do enhance growth and the interests of the people at large. The central theme is therefore the view that development essentially depends on sensible domestic politics. Export-led growth is a useful strategy for some states, but would clearly not work even if all developing states attempted it. As the editors conclude (p 16), the contemporary international economic environment 'certainly can stand considerable improvement', but it 'is not the principal

stumbling block keeping developing countries from achieving successful transition growth'.

GERALD SEGAL

University of Bristol

Pretoria's Praetorians: Civil-Military Relations in South Africa

Philip H Frankel

Cambridge: Cambridge University Press. 1984. 215pp. £25.00

The first part of this monograph is concerned with the genesis and development of armed forces that have evolved from competing civil military traditions: the British model, stressing the Defence Force's subordination to the politicians; and the *kommando* one with its emphasis on irregular guerrilla action by a nation-in-arms (Afrikanerdom) in which the distinction between the civil and the military is blurred. According to the author, since the early 1960s there has been an incremental shift away from the liberal Western ethic towards the *kommando* format where there is 'a strong coincidence in the personnel occupying elite civil and military positions' (p 25). At the very core of this nexus are the key figures of General Magnus Malan and P W Botha.

An arms boycott and the growth of a siege mentality—both products of apartheid policies and South Africa's pariah status in the world community—have brought this state of affairs into being. This has enabled the soldiers to project their national security role by stressing 'total onslaught' and its ideological counterpart 'total strategy'. For them, the threat can be tackled only through a concerted programme of long-term politico-military action. Thus, as the military supremo in Namibia, General Meiring, admitted to me in 1985, such operations (with their stress on Beaufre's 'dialectic of wills' where 'grey matter takes over from brute force') inevitably expand military influence in the public policy-making process. In Frankel's words, total strategy therefore 'engenders the psychological and institutional atmosphere conducive to the growth of a garrison state' (p 70).

It is this dynamic that lies at the heart of the Republic's militarisation: the burgeoning Defence Force) gradual incursions into scientific, educational and recreational arenas; extraordinary growth in domestic arms production; the SADF's (South African Defence Force) gradual incursions into scientific, educational and recreational arenas; extension of the conscription system and the subject races' recruitment into the security forces through the 'economic draft'; the displacement of the National Intelligence Service (previously BOSS) by the Directorate of Military Intelligence in the intelligence community hierarchy; as well as the appearance of khaki-clad figures in the top executive bodies, especially the State Security Council. These developments—which have bred a constellation of responses from groups whose opposition to militarisation ranges from the actively hostile to the mildly equivocal—are carefully catalogued in the author's central chapter.

However, for all of this, there is insufficient evidence to demonstrate that the South African military has moved into a more or less equal partnership with the Nationalist politicians (let alone into a position of *primus inter pares* or pre-eminence) which the

author's interchangeable use of the terms 'praetorianism' and 'garrison state' at the very least signifies. Instead it would seem that these military intrusions are the product, primarily, of the armed forces' co-optation by civilian state structures rather than *vice versa*.

On the other hand, this ambitious and wide-ranging study is the first comprehensive attempt to cover a subject of growing complexity and significance. Of the military's heightened influence there can be no doubt. And as Frankel so tellingly concludes, 'There is a certain irreversibility in the process. . . . each successive step into politics comes with greater ease than its predecessor' (p 181).

The Economies of the West Bank and Gaza Strip

Fawzi A Gharaibeh

Boulder, Colorado: Westview Press. 1985. 182pp. £19.50pb

Despite the great amount of literature on the Israeli-Palestinian conflict and the policies of the Israeli occupation of the West Bank and Gaza, little attention has been paid to the economies of the occupied Palestinian territories. Nor have the economic policies of the occupier received the attention which they should have received. One of the earlier attempts to correct this deficiency and fill the gap in our knowledge was the 1977 pioneering work, *Benefits and Burden: A Report on the West Bank and Gaza Strip Economies Since 1967* by Brian Van Arkadie and published by the Carnegie Endowment for International Peace. In that important study Van Arkadie analysed the extensive network of economic linkages which Israeli authorities developed soon after the 1967 occupation and which turned the territories into captive markets, sources of cheap labour and, ironically, a conduit for the transfer of Arab money to the Israeli economy through the remittances sent by Palestinians working in the oil states. As Van Arkadie pointed out, these aspects of exploitation were made possible by the fact 'that Israel has exercised complete control over the West Bank and Gaza Strip economies . . . similar to that exercised by a metropolitan power over a non-self governing territory.'

Dr Fawzi A Gharaibeh's book, written almost a decade after Van Arkadie's work, provides the reader with a wealth of statistical data on the economies of the West Bank and Gaza, their place in the context of the Jordanian economy prior to the 1967 War, their contribution to the Israeli economy, and their dependency status on Israel's economic policies on the one hand and on economic changes in the oil-producing states where hundreds of thousands of Palestinians work. In one sense one could say that Gharaibeh's fifty-six tables provide the statistical confirmation for Van Arkadie's analysis and conclusions regarding the naked exploitation of the occupied territories' labour, natural resources, and markets.

One of the puzzling aspects of the book is Dr Gharaibeh's approach to his subject. After having supplied the reader with his dazzling array of data, Dr Gharaibeh then

devotes the shortest chapter (six pages) in the volume to a description of Israeli economic policies in the West Bank and Gaza. The value of the volume would have been greatly enhanced had the author dealt with Israeli economic policies in more detailed fashion and integrated such analysis into the main body of the book. The failure to integrate the meaning and the impact of policy measures with statistical information deprives the book of much of its analytical value.

In the last chapter of the book, Dr Gharaibeh provides a good analysis of alternative economic futures for the occupied territories under three different sets of conditions: a) continuation of status quo; b) annexation by Israel; and c) transitional autonomy to be followed by either an independent Palestinian state or by an entity linked in some type of federation with Jordan. It is to his credit that the author avoids the sterile argument as to whether a state on the West Bank and Gaza will be viable in economic terms. After all, asks Gharaibeh, without a massive infusion of external funds would Jordan and Israel themselves be viable?

ABBAS ALNASRAWI

Education and Society: A Sociology of African Education

Ansu Datta

London: Macmillan. 1984. 213pp. £7.00

The book which is a study of the social bases of education in English-speaking Africa is intended to provide university students and trainee teachers with an introduction to the sociology of education.

In an overview of educational development in Africa, indigenous education and Western education in the colonial and post-colonial period are discussed. It is observed that in the early phase of colonial administration some missionaries in Africa believed that they were bringing education to an entirely uneducated people, a supposition which would have been valid if education was equated solely with literacy and formal schooling. Indigenous education which persists even now, to a limited extent, in various areas, had the main aims of preserving cultural heritage, adapting members of the new generations to their physical environment and teaching them how to control and use it and explaining to them that their own future, and that of their community, depended on the understanding and perpetuation of the institutions, laws, language and values inherited from the past. This type of education was by and large supplanted with Western schooling which stressed individualism and the tenets of the colonial capitalist system.

In the context of education and the social framework it is argued that education in Africa as elsewhere is socially determined. Traditional African societies, for example, where there was greater social homogeneity in that its members largely belonged to the same ethnic group did not demonstrate such differences in wealth, privilege and power as compared to modern industrial societies, and there was less room for social tension and conflict. Consequently, the education system was not so affected by demands of contending strata and groups. Things are said to have taken a different turn with the

advent of colonial rule in Africa. Diverse social strata and groups related to different points of productive and distributive processes came into existence. Their interests and aspirations were not always reconcilable. Thus the educational system came to be moulded by a clash of opinions with the dominant section contributing most to the pattern of development. In the early colonial periods it was the European elite which exercised supreme influence on education but the modern African elite gradually expanded and began to exert its influence especially by the end of the colonial rule.

As the book is mainly written for students of sociology of education, a detailed analysis of the social framework of education is followed by subjects which are commonly discussed in the sociology of education course programmes in educational institutions in Africa. These include the social functions of education, an analysis of the contribution education makes to the maintenance of society in which it takes place, and socialisation, a sketch of the process by which children become full-fledged members of society. It is noted that the process occurs under the influence of the family, the school, the group of close friends and the mass media. In a contemporary society it is emphasised that much of organised socialisation takes place in the school and this is discussed under 'The school as a community'. Under the role of teacher in society, the school and the wider community are examined, and lastly the book assesses the various social factors that contribute to educational inequality in Africa. In analysing these subjects, the author utilises sociological theories and method with many extensively and intensively researched examples from sub-Saharan Africa, including Nigeria, Ghana, Kenya, Tanzania, Uganda, Zambia and Zimbabwe. These examples make the book very interesting to read and relevant for the study of educational sociology in African institutions which have hitherto relied heavily on Western published texts whose relevance on the local social situations is minimal.

The book has one major weakness in being rather descriptive in some areas where critical analysis was required. In discussing the socialising process of the media of mass communication nothing is said about the negative influence of foreign television programmes and films which tend to inculcate alien values in the African youth. Further, little is said about the failure of many of the African countries to decolonise education after independence and hence tending to reinforce the 'culture of dependency' in their programmes of the so-called political socialisation through education.

These flaws in the book do not negate its value as a standard text for the sociology of education course programmes in institutions of education in Africa. It is lucidly written with a significant African social base hence providing relevant reading material in a subject that has largely been dominated by foreign texts.

BOOK REVIEWS

The State and Rural Class Formation in Ghana. A Comparative Analysis

Piet Konings

London: KPI (Monographs from the African Studies Centre, Leiden). 1986. 391pp
£30.00

Those who keep up with the literature on modern Ghana will remember Piet Konings' fine study of the miners at the Ashanti Goldfields' workings at Obuasi, published in 1980. It is perhaps surprising to find him abandoning industry and industrial workers for the Ghanaian countryside in this important and timely study of the differential impact of state intervention in the agricultural sector on rural class formation.

Konings begins with a well-argued survey of the relevant literature on class and the state in West Africa. There are some odd omissions from this such as the work of Sara Berry, Dick Crook and Jane Guyer but he does provide a useful critical bibliography. The meat of the volume consists of three well-researched case studies of the very different economies of cocoa production in Ahafo, rice farming in Builsa and food production in the Upper Region.

Each of the studies is valuable in its own right but haunting all three is the spectre of ill-judged, inept and frequently virtually confiscatory rural policies which have enriched few and impoverished the majority of farmers. Disregarding the serious social disruption and human unhappiness that has attended these instances of rural planning, none appears to have improved production or efficiency in any palpable way and in the case of the rice projects has damaged the environment in an area of considerable ecological vulnerability.

Konings' general analysis is of great significance in these dark days. He questions the conclusions of those who argue for the introduction of more intensive capitalist farming schemes in order to bring about the all-important but so far lacking 'agricultural revolution'. But while he adopts some of Bates's argument for larger investment in peasant agriculture and a rise in farm-gate prices he is clear that the politics of distribution remain dominated by powerful private and group interests whose concerns militate against the creation of an economic environment in which peasants will find themselves sufficiently induced to increase their levels of production.

RICHARD RATHBONE
Harvard University

A Vision of Hope: The Churches and Change in Latin America

Trevor Beeson and Jenny Pearce

London: Fount Paperbacks. 1984. 290pp. £2.95

This is a valuable resource book, providing a political and economic overview of twelve of the twenty republics that make up the Latin American continent, as well as a short history of the development of the Christian churches in each of these countries. In the Preface the editors describe their main concern as being 'to describe the life and witness of the churches in Latin America through the eyes of Christians who have taken sides with the poor and given voice to the cry for justice and basic human rights' and to outline

the mission of the churches in the social, political and economic context of their times and places.

An Introduction deals with the continent as a whole; its history, its ethnic diversity, the impact of wars and colonialisation, its political and economic development, and the role of the churches.

Chapter 2, 'Mission in conflict', moves from the statement that 'historically, culturally, statistically, Christianity is everywhere visible in Latin America' to an analysis of the process which has brought it increasingly into the news in recent years. The situation of ferment and change began at least as early as 1968, when the Latin American Bishops' meeting at Medellín faced up to the situation of sinful inequality and oppression in which the majority lived and made their now famous 'option for the poor'. The Church, and not only the Catholic Church, renounced its long-held role as partner of the powerful and upholder of the status quo, and became the voice of the voiceless, standing with the poor and dispossessed of the continent in their struggle for justice and a radical change in the social and economic structures. This active presence of the churches in the world has political implications which have not been accepted by all sectors—many prefer to think of the church as a 'spiritual' entity, calling people to reflection on the next life rather than to commitment to bringing about in this life God's Kingdom of justice, love and peace. This involvement in life and experience has given birth to a new approach to theology—liberation theology—and the controversy surrounding this new way, which in its turn is born of a new way of being a Christian community, is now reverberating far beyond Latin American boundaries.

The following chapters on individual republics begin with Cuba, since 'An understanding of the Cuban experience is essential to any analysis of the processes of change and conflict in the rest of Latin America.' A political, social and economic overview is followed by a section on the churches, their witness to social change and the tensions and conflicts resulting from an increasingly challenging and confrontational stance by Christians. A final chapter gives information about British missionary involvement in the continent, and there is a list of useful contacts and a list of books for further reading.

The book has tackled an enormous task courageously and the historical perspective, analysis, and understanding of the role of the churches in Latin America owe much to the personal experience not only of the writers, Trevor Beeson and Jenny Pearce, but also that of the specialists who contributed background papers and advice.

Nation against Nation. What Happened to the UN Dream and what the US Can Do about It

Thomas M Franck

Oxford: Oxford University Press. 1985. 334pp. £21.50

Neither non-Americans nor academics should be put off by the sub-title of this book.

Some of the issues it considers *do* reflect the fact that it has an American audience primarily in mind. Furthermore, the author's frequent references to the maintenance of enthusiasm for and optimism about the UN for up to two decades after its establishment ring very strangely in a European ear. Also the according of a knighthood to Mr Edward Heath is a sharp reminder of the book's extra-British origin. However, the author's treatment of his subject is very far from parochial, and the specifically prescriptive element in the book is negligible.

What Professor Franck provides is a knowledgeable, sophisticated, and well written survey of the UN's nature and its political ways—and it is certainly not just Americans who stand in need of education in this area. He emphasises that in essence the UN is a collectivity of states, each pursuing its own conception of its best interest. Accordingly, it is quite unrealistic to expect the Organisation to behave with judicial impartiality: the 'realistic analogy is not a court . . . but a bazaar, with its emphasis on price and trade' (p 245). However, it *is* appropriate for the analyst to note any glaring inconsistencies in behaviour at the UN, and the author is not afraid to speak up. He observes that in relation to the use of force neither superpower follows a principled approach; that on human rights many members are two-faced (and that Israel gets particularly unfair treatment in this area); and that India often behaves with a notable flexibility ('*Et Tu, Nehru*' is the title of one of his chapters). He draws attention to the 'lusty mixture of politicisation and patronage' (p 115) which goes into the staffing of the UN Secretariat (another chapter's heading is 'His Sisters, His Cousins, and His Aunts') and that the socialist states have made their Secretariat members into the 'unabashed agents of government' (p 104). In this connection the author, referring to his time on the staff of the UN Institute of Training and Research, says that his Soviet deputy reported to his country's mission to the UN 'at about 4 pm daily' (p 108). The UN's assessment system is said to have been manipulated by the majority of members in such a way as to reduce the original 'capacity to pay' principle 'to a near-fiction' (p 256).

However, in Franck's view there is very much another side to the UN picture. He notes the usefulness of the Organisation as a forum, and draws attention to the even-handedness of the General Assembly in condemning the aggressive use of force. He goes into some detail regarding the valuable 'autonomous activism' (p 116) of the Secretary-General, and it is worth underlining that he assesses the work of both Thant and Waldheim much more favourably than is usual. He thinks that the UN's most fruitful political work has been in the area of peace-keeping, and that the Security Council deserves praise for its role in this respect. So far as the United States is concerned, the author argues that it is just not true that the UN generally acts in a manner which is contrary to American interests. Accordingly the United States should not moan about the Organisation and think of leaving but instead follow 'a muscular strategy of staying in' (p 272).

For its combination of readability, scholarship, and sound judgement this book would stand out in any company. In view of the fact that writing on the UN often falls short on more than one of these counts, and all too frequently gets bogged down in constitutional detail or boring chronology, Franck's achievement is all the more notable. It is to be hoped that a paperback edition will soon follow.

ALAN JAMES
University of Keele

Third World Diplomats in Dialogue with the First World

Robert J Moore

London: Macmillan, in association with International Development Research Centre, Ottawa. 1985. 179pp. £20.00. £7.95pb

This is a very well written book which has many sensible things to say: if they are heeded it will have an important impact on the diplomatic activities of Third World states.

What the book is concerned with is neither the traditional bilateral work of diplomats nor their parliamentary role at large international conferences. Instead it looks at the ways in which Third World diplomats can assist in creating sympathetic groups at the non-official level in the states to which they are accredited. The context in which the material is presented is that international economic reconstruction is inevitable, and that the 'education' of people in the developed world will help it to come peacefully rather than painfully. This is asserted rather than argued, but whether or not it is regarded as analytically valid has no bearing on the value of the author's advice as to how Third World diplomats can best present their views and policies to the interested public.

For a start, says the author (a former High Commissioner for Guyana to Canada), diplomats should get away from the idea that they must follow a life-style which involves 'a dash of manner and a splash of funds' (p 19). Luxury must be cut out and the economic realities back home must find some reflection in diplomatic missions abroad. Entertainment cannot be dispensed with, but its organisation could be rationalised and its offerings more modest. Then the author goes on to consider how Third World diplomatic missions can most profitably use the local media, universities, and citizens' organisations. Throughout these chapters there is an emphasis on the need for cooperation between the states of the Third World, so that they can both improve the impact of their case and make best use of their limited resources. This approach also finds expression in the book's final chapter where the point that young diplomats need to be systematically trained is linked with the suggestion that some training schools could be established on a regional basis.

Much of what is urged in this book is the product of not much more than intelligent thought applied against a background of experience. But even the obvious often needs restating, and here the author is calling for a more disciplined approach to a relatively neglected area. Even senior diplomats should find the book a useful stimulus, and younger ones will benefit a lot from reading it. And the last sentence does not just refer to diplomats from the Third World. All states are nowadays anxious to cultivate the informed and also the more general public in foreign states. Accordingly, the book has a wider relevance than its title might suggest.

University of Keele

The Political Environment of Economic Planning in Iran, 1971–1983: From Monarchy to Islamic Republic

Hossein Razavi and Firouz Vakil

Boulder, Colorado: Westview Press. 1984. 194pp. n/p

In seven concise chapters, authors Razavi and Vakil, who both served at the Plan and Budget Organisation (now Ministry) of Iran, offer insiders' knowledge of the operation of Iran's economy before and after the Revolution, focusing on the politics of planning.

The authors' description in Chapter 3 of the planning system reveals the technical problems and shortcomings: weak planning machinery; unsophisticated planning process; too few planners and too little data to ensure the degree of comprehensiveness so necessary to a good plan. The authors discuss the poor project evaluation process and argue that the entire issue of economic planning was a virtual formality for spending the allocations. There was also the lack of a mechanism to generate regional balance in development activities. The author's verdict on economic planning under the Pahlavi regime was that it was a 'futile formality with no positive impact on the management of the economy' (p 59). By the final years of the Fourth Plan, the economy had turned into a consumption-oriented, largely urban society with a rapidly growing deficit in the balance of payments (p 62). The authors also critically assess development priorities: the goal of creating employment ranked below that of economic growth and matters of social justice never received proper attention.

Chapter 4 treats the economic and political problems of the Pahlavi state. Here the authors describe the Tehran oil agreements and the oil price increase as 'an external shock to the national entity'. Problems were created by the Shah's dream of a great civilisation and his unrealistic attempt to build it as soon as possible. The description of the meetings in Ramsar and Gajereh in July 1974 to discuss revisions in the Fifth Plan makes for fascinating reading. Here we are told that despite rumblings from lower-level bureaucrats, economists, planners, and statisticians, the Shah and his ministers decided to do the utterly foolish: that is, to take advantage of the massive increase in oil revenue and raise sectoral allocations, greatly straining the economy's absorptive capacity. Planned inflation led to social problems. A series of policy mistakes, caused by the Shah's vision of Iran as the world's fifth industrial power by the turn of the century, was compounded by bottlenecks and led to an economic and eventually political crisis of the most serious proportions. Not least of the problems was the total disaffection of the bureaucracy, whose civil servants went on strike in late 1978.

Chapter 5, on the demise of the Shah and the establishment of the Islamic regime, is somewhat schematic. Chapter 6 deals with the future of planning of Iran; the authors' view of the Islamic Republic's economic future is optimistic. They point out that there is no Islamic economics as such, but that a mixed economy has been adopted, with some success. They also state that 'the initial design of the planning system is sound and feasible' (p 120). This might come as a surprise to the new political elite itself, whose planners have not been able to implement their first—Iran's sixth—national development plan. In the absence of a resolution of the question of property rights (whether the state or the market will be the dominant economic agency), in the absence of consensus within the regime as to the overall organisation of the economy (eg which sectors are to receive priority), and due to the continuation of the war with Iraq, planning has been at best *ad hoc*.

The expanded role of the public sector in the Iranian economy and the short- and medium-term irreversibility of this role makes it important to talk about planning in Iran. And because of the continued significance of state policy in Third World countries, the book's discussion of the problems and prospects of planning in Iran offers lessons of a wider relevance.

VALI MOGHADAM

New York University

Politics in Mexico

Edited by George Philip

London: Croom Helm. 1985. 223pp. £19.95

This is a useful collection of articles written for a conference in 1984. They deal with the immediate effects of the 1982 debt crisis in Mexico and attempt to assess probable future developments. The first three essays, by the *Financial Times* journalist, William Chislett, the ex-British Ambassador to Mexico, Norman Cox, and the editor, are careful and sensitive discussions of the interaction of the political and economic dimensions of the present crisis. Any brief summary runs the risk of doing injustice to the complexity of the arguments, and with a political system as Byzantine as the Mexican, political analysis is necessarily both difficult and complicated. Nevertheless, the effort must be made: the present Mexican government is caught on the horns of several thorny dilemmas and there is consequently little room for moderate reformism. While the authors are not unduly pessimistic about the future prospects for the Mexican political system, they do sound a note of warning and point out the difficult choices facing the government. Between pressures from the populist Left and the liberal Right, will the government be able to continue to steer a middle course? The system has survived challenges in the past, but in so doing it has made concessions and changed its own nature. The consensus among these authors is that moves by the present government are likely to lead in the direction of greater overt conflict in the system and an erosion of the old style of political control by local bosses. The exact nature of the emerging system will depend largely on whether the Right or the Left have more influence. Anyone who wishes to understand the present situation in Mexico would be well advised to look at these chapters. The remaining papers in the book involve more detailed treatments of a broad range of more specialist topics. This is not a book for the beginner: some initial knowledge of Mexico is advisable to give some context to the papers presented in this volume.

Testing Democratic Theories in Korea

Sung M Pae

London: University Press of America. 1986. 300pp. \$27.50. \$14.50pb

As contemporary scholars of comparative politics admit, one of the most serious

weaknesses in the field of developing democracy in general and Korean politics in particular has been the virtual non-existence of a methodologically balanced book dealing with the dynamic social and political changes that have taken place in developing countries in the 1970s and 1980s. In this regard, the author certainly makes a great contribution to the field of political development and deserves high scholarly recognition.

Overall, it is an outstanding piece of work. This study examines the obstacles to democracy, the characteristics and tasks of democracy, the applicability of the major theories and the new integrated model of democracy to Korea through a careful analysis of thirty-eight years (1948–85) of the five consecutive Republics.

This work is impressive not only for the author's methodological skill but also for his theoretical achievements and the nature of its comprehensiveness. The author coherently organises the theories of democracy (five major theories) and tests them with numerous data with a special emphasis on public policies, programmes and various measures under different government structures and leadership which predict both stability and instability with respect to political development in Korea.

The author approaches issues and problems very systematically. The theoretical framework which he applies to specific problems and issues is carefully developed and very appropriate. He also writes in a cogent, coherent, and interesting fashion.

Pae's conclusion that 'each of the five theories is necessary but not sufficient to warrant a viable democracy in Korea' is a logical and reasonable one. His suggestion of an integrated model and its application to Korea to prove the viability of democracy in Korea is an excellent synthesis and advance upon the work that has been done in this area to date.

It is evident that the author has an attraction to empirical and behavioural questions and analyses. Unlike many, however, the author admirably manages to combine his intense interest in empirical analysis with the traditional study of political theory with an untiring commitment to the examination of developing democracy. Thus, one of the significant contributions the author has made in this work to the study of political development is the careful employment of both normative and empirical methodology, which will allow a broad spectrum of students and scholars alike to help understand confusing questions on developing democracy in general and Korean political evolution in particular. This book should be an excellent reference for both undergraduate and graduate studies, and an invaluable addition to library collections for major universities.

If this reviewer has any suggestion to the author regarding this book, they are mostly technical.

First, it may be helpful to have readers informed clearly of the advantages and disadvantages of the methodology employed for this study. The common question the author may encounter is 'Can democracy be quantitatively measured?'

Secondly, although briefly and sporadically mentioned, the importance of the role of the military in developing countries and Korean politics in particular needs more detailed analysis than it receives.

Thirdly, we know there is no universally accepted theory of political development. Many of the theories various scholars have drawn up overlap and share common features. The selection and testing of the five theories in this work is reasonable and justified. Some readers, however, may raise such questions as 'Why did the author test

only the five theories of democracy?" 'Are there any other relevant and viable theories to be tested?'

Fourthly, political development cannot be studied simply as a result of forces and decisions operating within the boundaries of a particular nation. The majority of the developing countries have a history of being influenced significantly by developments and/or pressures outside the country, over which they have little or no control. The impact of the downfall of Marcos in the Philippines on Korean political environment is an excellent example. Study of international environment as a source of factors influencing internal stability, development and decay generally has been neglected. The Korean case is not an exception. We may have to look into this area more seriously in the future.

Fifthly, in recent months, there have been some important changes in the political environment, especially since the recent election of the National Assembly, the emergence of a strong opposition party, the trend of uniting various opposition factions, the moderation of the position of the party in power towards opposition parties, and the radicalisation of student activities. Although it is extremely difficult for us to predict what development will be next at this juncture, it may be a good idea to touch on some of the most recent political developments in Korea in order for this book to be as current as it can be.

As a final note, writings on democracy in developing countries usually fall into two groups. Pessimists state that democracy is impossible in those areas because of the backwardness of the people, the imperatives of growth and stability. Optimists say that democracy is possible, but dwell mainly on its desirability, without meeting many of the arguments set out by the pessimists.

One of the strengths of this monograph is that the author comes to grips with the hard questions. He recognises the existence of the two approaches, provides a basis for a coordinated policy, treating the goals as complementary instead of being competitive. Because this work meets the hard questions, it can help those young intellectuals in the developing nations who want to believe democracy is possible. With the proposals in this monograph, would-be democrats can say that they are fully aware of the obstacles, and have reasonable suggestions for successfully overcoming them.

Soviet Interests in the Third World

Edited by Roger Cassen

London: Sage (for RIIA). 1985. 329pp. £27.50. £10.50pb

If you are looking for a book that offers dramatic new insights into the study of Soviet policy in the Third World, then the book under review is not for you. However, if you want a well-reasoned and documented study of the motivations and current directions of Moscow's Third World policies then the Cassen collection may have what you are looking for. The sixteen chapters cover a wide spectrum of subjects in a careful and workmanlike fashion. The book complements other studies, such as Adeed and Karen

Dawisha's collection of essays on Soviet policy in the Middle East, rather than offering a new style of analysis.

What is most useful about this collection of articles, the product of a study group at the Royal Institute of International Affairs in London, is that it eschews, in the words of Peter Lyon in his piece on the Soviet Union and South Asia, studies of Soviet policy that are 'often only a diaphanously disguised form of demonology, according to which the Soviet Union is portrayed as a rapaciously expansionist power, seemingly immune from the constraints and inhibitions which usually check and limit the activities of even ideologically self-conscious actors on the world stage'. Rather, Cassen's collection embodies a more detached and calm form of analysis which takes into account Soviet capabilities and weaknesses and the motivations of Third World states. Only in a few places, such as in Jonathan Steele's generally admirable account of Soviet ties with Angola and Mozambique, does one feel that a little more weight should have been given to the motives and policies of Moscow's partners. In the case of the Steele chapter this minor fault is evident in the sections dealing with South African aggression against Angola and Mozambique. Steele says that faced with the local superiority of South African arms, 'the Soviet leadership was not willing to increase its stake'. However, Soviet arms supplies to Angola have kept pace with the threat to Angolan independence and with the Angolan armed forces' ability to use them effectively. The Angolan government has had at its disposal large quantities of arms and Cuban troops but has chosen to avoid the use of the latter in clashes with the South Africans in order to inhibit the opportunities for greater external intervention and to emphasise Angola's intention to maintain its independence and fight its own battles.

Of particular value in this collection are the contributions by Gerald Segal (Sino-Soviet relations in the Third World), Peter Lyon (South Asia), Sam Nolutshungu (Africa), Robin Luckham (Soviet arms supplies to Africa), Fred Halliday (South Yemen) and Jonathan Steele (Angola and Mozambique). The Segal chapter is particularly worth reading for its thorough analysis of Chinese policies as well as Soviet ones and his recognition of the lack of Third World support to China's 'splittist' and functionalist policies and the greater 'realism' of current Chinese policies, which are not dominated by confronting Soviet involvement in the Third World.

Information for Authors

Third World Quarterly welcomes contributions on important Third World matters; preference will be given to those which deal succinctly with an issue which is both important and clearly defined. Articles which are narrative or descriptive and lacking in analytical content are unlikely to be accepted. Comparative articles are welcome but should incorporate a balance of empirical evidence and theoretical speculation. The writing style should avoid academic jargon and colloquialism, and manuscripts should be carefully checked for errors.

Articles submitted to *Third World Quarterly* should be original contributions and should not be under consideration by any other publication at the same time: if an article is under consideration by another publication the author should clearly indicate this at the time of submission: if published in *Third World Quarterly* it cannot be reproduced in whole or substantial part elsewhere without permission from the Editor of *Third World Quarterly*. The Editor is responsible for the selection and acceptance of articles, but responsibility for errors of fact and opinions expressed in them rests with their authors. Copyright in articles published in *Third World Quarterly* is retained by the journal.

Full names of the authors should be given together with the full address to which correspondence should be sent, and, where possible, a contact telephone number. Current and recent academic and professional affiliations, for use in the 'Notes on Contributors' section should be supplied, together with a list of major publications (with dates) and of forthcoming books.

Authors are not expected to correct proofs of accepted articles. Every effort will be made to avoid errors and contributions will be checked at both galley and page-proof stages.

Authors are entitled free of charge, to twenty-five offprints and five copies of the issue in which their article appears.

Presentation of Manuscript

- Authors should submit two double-spaced typed copies (in English) on one side of A4 opaque paper. An additional copy should be retained by the author as manuscripts are not returned to authors.
- An abstract should be submitted with the manuscript; this is to comprise a one-paragraph summary of the main points of the article in not more than 150 words.
- Allow one inch margin on left-hand side and number manuscript pages consecutively throughout the manuscript. Broad divisions and section headings should be clearly marked where appropriate.

INFORMATION FOR AUTHORS

- Footnote numbering should be clearly marked in the text and the notes placed at the end of the manuscript, not at the bottom of the relevant page.
- Tables (including graphs, maps, figures) must be submitted in a form suitable for clear reproduction on a separate sheet of paper and not within the text. Each table should have a brief descriptive title. Place all footnotes to a table at the end of the table. Define all data in the column heads. Every table should be fully intelligible without reference to the text. If camera-ready artwork cannot be provided by the author, our printers can undertake the preparation of tables within certain financial constraints.
- If any figure, table, or more than a few lines of the text from previously published material are included in a manuscript the author *must* obtain written permission for republication from the copyright holder; the original source should be clearly noted and acknowledged.
- For punctuation, spelling and style, follow the *Oxford English Dictionary* and the *Oxford Dictionary for Writers and Editors*.

Footnote Style

- In the case of books, the author, title of the book, place of publication, publisher, date of publication, and page numbers should be given in that order: e.g. J S Kirk, *Middle East on Trial*, London: Bodley Head, 1977, pp 3-9.
- In the case of articles, the author, title of article, name of the journal, volume number, issue number in brackets, the year and the page numbers should be given in that order: e.g. J Birks, 'Migration in the Middle East', *Middle East Review* 5 (4) 1979, pp 27-32; or in the case of articles/chapters within books: J Birks, 'Middle East Labour' in *Middle East Today*, S Sinclair (ed), London: Frank Cass, 1978, pp 28-36.
- Reference to privately circulated or mimeographed material should also contain full references including the name of the appropriate department of the institution concerned.

Third World Quarterly will do everything possible to ensure prompt publication once a contribution is accepted. This will be facilitated if all manuscripts and illustrations conform to the form and style detailed above. Manuscripts that do not follow this format may be returned for resubmission.

Authors are strongly advised to examine issues of *Third World Quarterly* in conjunction with the reading of these notes.

Deletions and Alterations

If the Editor is of the opinion that articles provisionally accepted for publication need to be shortened or particular expressions deleted or rephrased, such proposed changes will be submitted to the author for approval prior to publication. Corrections of errors in punctuation, spelling and style will *not* be submitted for approval if they do not alter the meaning or sense of the original manuscript.

Journal of Peace Research

Journal of Peace Research is an interdisciplinary and international quarterly of scholarly work in peace research

Vol. 23 No. 2 June 1986

International Review of Education

Internationale Zeitschrift für Erziehungswissenschaft
Revue Internationale de Pédagogie

UNESCO INSTITUTE FOR EDUCATION - HAMBURG

Editorial Board

C. S. Brembeck, *East Lansing*; R. H. Dave, *Director, UIE, and Chairman of the Board*; S. Grewal, *New Delhi*; G. Hausmann, *Hamburg*; H. W. R. Hawes, *London*; G. Mialaret, *Caen*; A. Miroljubov, *Moscow*; M. J. Sebastiani Ormastroni, *São Paulo*; M. C. Sutarja, *Manila*; D. Tzvetkov, *Sofia*; E. A. Yoloye, *Ibadan*

The *International Review of Education* was first published in 1955 as an international forum for the exchange of information about advances in educational theory and practice throughout the world. Today, appearing quarterly, it still seeks to serve the needs of departments and institutes of education, teacher training institutions, and professional readers, internationally, by providing scholarly information on major educational innovations, research projects and trends.

Edited from the Unesco Institute for Education, Hamburg, with the professional and technical advice of an independent and international Editorial Board, each volume usually includes two *General Numbers* containing articles and notes on a wide variety of educational topics, together with book reviews, and two *Special Numbers* guest-edited by distinguished educationists and with contents focused on particular themes of contemporary relevance.

The Islamic Foundation

Hundreds of books are published every month from East and West on Islam and the Muslim world. It is humanly impossible for individuals to keep up with the information explosion. This unique quarterly publication of the Islamic Foundation aims not only to introduce but to give a comprehensive and critical evaluation of books on Islam and the Muslim world with due consideration to the Muslim viewpoint. The reviews are written by scholars of Islam and area specialists. The four issues are published in Autumn, Winter, Spring and Summer.

No scholar or library concerned with the contemporary world, whose future is now inextricably linked with that of the Muslim world, can afford to miss this important journal...

- Keeps abreast of important periodic literature on Islam and the Muslim world.
- Critically evaluates issues in important books through in-depth and short reviews
- Contains comprehensive bibliographies on some important themes of immense interest to scholars and researchers.

THIRD WORLD FOUNDATION

for social and economic studies

Organisation

The Foundation, registered as a Charity in 1978 under the law of England and Wales, has its headquarters in London. The Trust Deed provides that the Foundation will not accept directly or otherwise, any aid, grant or assistance from any government or official agency.

Objectives

To work for the intellectual, economic and social advancement of the people of the Third World through publications and research. To assist in the evolution of a fundamentally just and equitable relationship between the Third World and the developed countries. To create greater awareness of the causes of poverty in the Third World.

Settlor and Trustees

The Trust Deed is made between the Bank of Credit and Commerce International of 39 Boulevard Royal, Luxembourg (Settlor) and the Trustees who exercise their powers in accordance with the provisions of the Trust Deed.

Advisory Committee

The work of the Foundation is guided by a committee consisting of: Dr Ali Attiga, Secretary-General, OAPC; HE Mr Bernard G Chidzero, Minister of Finance, Economic Planning and Development, Zimbabwe; HE Mr K M S Dadzie, Secretary-General, UNCTAD; Mr E V Iglesias, Minister of Foreign Affairs, Uruguay; HE Mr Amir Jamal, Permanent Representative of Tanzania, Geneva; HE Mr S S Ramphal, Secretary-General, Commonwealth Secretariat; Professor Abdus Salam, Director, International Centre for Theoretical Physics; Professor A K Sen, All Souls College, Oxford; Dr K Soedjatmoko, Rector, UN University.

Mr Altaf Gauhar is the Secretary-General of the Foundation.

Mr Azim Husain is the Principal Adviser of the Foundation.

Membership

Membership of the Foundation is open to individuals and institutions. The annual membership fee is £40/US\$60. Members receive *Third World Quarterly* and *Third World Affairs* free of charge.

some of these desiderata are not new, the three authors present very convincing arguments for the urgent need to implement them. Policymakers in both industrial and less developed countries should read carefully into these suggestions otherwise we may face the risk of gloomy forecasts becoming a reality.

From the fifth chapter on, the topic of integration becomes the focal point. This is introduced by an interesting paper by Juan Somavía, emphasising the importance of the political aspects of regional cooperation with particular reference to border disputes and democracy. It contains a list of the lines of action which could be taken by the Latin American countries to further the objective of achieving internal and international peace in the region.

The following chapters concentrate on the economic aspects of regional integration with particular reference to several case studies evaluating the results of the CACM, CARICOM, and the Andean Pact in increasing the trade flows among themselves. These are preceded by a general discussion by José Antonio Ocampo and a précis by Dragoslav Avramovic on the causes of the recent collapse of intra-Latin American trade.

Ocampo's article is a most interesting piece. It deals with the financial aspects of intra-regional trade and examines closely what can be considered the most important obstacle at present to increasing trade between the Latin American countries: the system of payments. Ocampo makes the point that intra-regional trade disequilibria have forced deficit countries to reduce their imports from LAIA (Latin American Integration Association) countries. Ocampo analyses the LAIA payments agreement (based on reciprocal lines of credit and multilateral compensation agreements) and attributes the decline of trade flows among Latin American countries to the inadequacy of the available lines of credit, which around 1980 led some countries to operate outside the agreement. This problem was further aggravated in 1982, when the system of coverage was drastically reduced due to the withdrawal of several countries of their debtor balances from multilateral compensation. The chapter concludes by offering several lines of action for reforming the payments system.

However varied the topics dealt with and the variety of opinions expressed throughout the book there were a number of recurrent views and a certain homogeneity in the style of argumentation of several of the authors. For instance: on the diagnosis of the current economic situation and the causes of its steady deterioration; on the desirability of policies geared towards redistribution of income and more autonomous development in Latin America and economic expansion and less trade protectionism in the industrial countries; on the urgency of reforming multilateral lending agencies; and, on the need for the Latin American countries to act more in concert. Even the language used by some of the authors is strikingly similar: 'financial permissibility', 'external vulnerability' of Latin America and its 'insertion' in the international system, not to mention the obvious 'centre' and 'periphery'.

charges of enriching himself at the state's expense was perhaps best reflected by General Ali Said, chairman of the Supreme Court, who asserted that 'Indonesians who don't feel insulted by a recent article in an Australian newspaper on the alleged business dealings by President Suharto's family should relinquish their citizenship'.⁷

The economy in crisis

The oil boom which has carried the Suharto regime forward so successfully throughout the past decade has now collapsed and bleak predictions are being made about the future. The World Bank's 1986 Report on the Indonesian economy, produced in June, forecast less than 2 per cent annual GDP growth for the next two years while Western embassy sources predicted that GDP would decline by as much as 3 per cent this year.⁸

Oil and natural gas have accounted for about 70 per cent of Indonesia's foreign exchange earnings and about 65 per cent of state revenue. The 1986 budget announced in January this year cut overall state expenditure by 7 per cent with a drastic curb of 22 per cent in the outlay on development projects. Moreover, the budget was soon shown to be out of touch with reality because it assumed that world oil prices would level out at \$25 a barrel, whereas within three months, prices had dropped to around \$13 a barrel. Attempts to boost non-oil exports to reduce the country's reliance on oil have been a major part of government policy for more than a year, but the results have been negligible.

In an economy where the state controls such a huge proportion of economic activity, cutbacks on the scale planned in the 1986 budget affect the fortunes of many businesses that have lived for years on government contracts. The decline in development projects provided for in the budget led commentators to warn in January that some 13,000 small and medium-sized contractors would be forced out of business by the retrenchment.

Foreign investors have shied away from Indonesia, discouraged by a cumbersome and corrupt bureaucracy. The level of investment in 1985 was less than half that of the previous year. Much of the criticism levelled at Indonesian economic management by the World Bank and

countries, including France, Italy and Switzerland, felt that the proposal was ill-advised, in that it might have the effect of removing competent international civil servants, solely in order to preclude the re-election of M'Bow.¹¹

▲ General Assembly (UNGA)

Special Session on the Critical Economic Situation in Africa

New York, 27-31 May 1986

■ The General Assembly's special session on Africa, the first to concentrate on the problems of a single region, was attended by representatives of the UN's 159 member-countries, including twenty-two ministers. Also present was President Abdou Diouf of Senegal, current Chairman of the Organisation of African Unity (OAU), which had initially requested the session in July 1985. At its conclusion, the session adopted the UN Programme of Action for African Economic Recovery and Development 1986-90, closely based on the OAU's own African Priority Programme for Economic Recovery 1986-90 (APPER).

Present Diouf presented the session with a report formulated by the OAU and the UN Economic Commission for Africa (ECA) in a series of meetings. After analysing the present crisis and future prospects of Africa, the report presented the APPER, first adopted by the OAU Summit in Addis Ababa in July 1986,¹² as the basis for a collective African effort towards self-reliance. According to the report, rising population, declining per capita agricultural production, falling commodity prices, ecological damage, external debt, domestic policy shortcomings, conflicts and natural disasters combined to create a crisis in Africa far beyond the scope of the present prolonged drought. The priority projects proposed in the APPER required a total of \$128bn over the next five years, including \$57bn for agriculture and \$60bn in related support of agricultural development. Of the total, \$82bn, or around 70 per cent, had already been pledged by African countries, leaving a target for international assistance of \$46bn, or an annual average of \$9bn over the period of the programme.¹³ In presenting the report, President Diouf described agriculture as the 'priority of priorities' for Africa, a fact recognised in the APPER. He said the emphasis of the programme was on the mobilisation of domestic resources within Africa, and the improved use of external assistance. The 30 per cent of the total, requested from the international community, was needed as a complement to Africa's internal efforts to achieve self-sufficiency. President Diouf also spoke of the need to improve Africa's economic environment by stabilising commodity prices at remunerative levels, increasing the flow of concessional resources to the continent, and alleviating Africa's burden of external debt service, estimated at an annual average of between \$14bn and \$25bn over the next five years.

The response of the major industrialised countries was both enthusiastic and dismissive, with countries such as the US, Britain, France, West Germany and Japan praising the document's tendency towards self-criticism, and the African governments' tendency to indict their past obsessions with urbanisation and expensive industrialisation projects at the expense of agricultural development, and inefficient state bureaucracy. They also welcomed the emphasis, echoed in many of their own speeches at the session, on self-reliance, and the concessions made to the philosophy of free markets and private enterprise. They refused, however, to

him, the PMDB, as main authors of the Plan, and the PFL, who largely make up his ministry. He has turned the government of the 'New Republic' to the right and bet all on a single card. The momentum of the Plan should last until the November elections, and should pay off in terms of the structure and character of the Constituent Assembly: but then? Already, as noted above, there are "enemies of the Plan". Already there is worry about inflation, the deficit, and about the long-term ability of the government to impose upon Brazil the rigour, discipline and control which are needed to make the Plan work.¹⁷⁰ The *fiscals do Sarney* cannot easily prevent manufacturers from producing 'new' lines, only slightly modified, but at substantially higher prices. The over-heated economy already is causing concern: will the short, sharp shock peter out, or be modified and qualified out of existence?

If the Cruzado Plan comes to grief, Sarney has no party to which to turn for support, and the politicians, who today applaud, will run for cover. The people, the *fiscals do Sarney*, will find prices rising again, and the right, now riding high, and strong in government, will be discredited. And the left? One of the best-informed and most perceptive of Brazilian journalists, in a recent interview, drew an analogy, appropriately enough in Brazil, from football. There may be disagreement and differences among players. Sometimes they may even send a rival a curling ball to confuse him, but, when goals have to be scored, when the need is acute, they will pass the ball to the player who can be guaranteed to score those goals. For the left in Brazil, at present, when the game becomes serious, the leading goal-scorer is still Brizola.

structures which spawn hunger and poverty and inequality in all spheres?

KINNOCK: I take the view, and you quoted Nye Bevan, that liberty is a by-product of economic sufficiency, and the first battle to be fought is one for attaining the rudimentary level of economic sufficiency out of which can come the self-confidence and independence of spirit that is essential to the operation of democracy. Now the effect of those in government who are trying their best and those working for the community (I think they go beyond the definition of social workers, incidentally; I think that their commitment is much broader than that) is to stimulate that confidence, that independence amongst people who can gain their own living. And after, say, half a generation or a generation they can be much more assertive about their rights and expectations than they can be if they are living at the level of total destitution. It's a very big problem and it will take a long time; I couldn't possibly exaggerate how long and how complex the solution of this problem will be. There are only two reactions that are possible in these circumstances. One is to give up the struggle and to surrender to what appears to be inevitability; one can claim all kinds of justification for such a course of action—sentimental, 'realistic'—but the reality of the matter is that no one is actually helped. The other alternative is to realise that one has to start somewhere. And starts have already been made so that we can actually commit our strength and energy to those starts. Giving up is not a serious alternative.

AG: *Do you now feel encouraged to commit resources of aid or grant to that kind of a situation? That the assistance you might provide would be well utilised, and it would not be so much money down the drain as some experts suggest?*

KINNOCK: No, I don't think it would be money down the drain. The intelligent thing to do, and I don't say this in any patronising sense, for we don't want a new colonialism, is that there are people there in their hundreds of thousands, in their millions in India, some of whom are professionally engaged, others who could be counted as being among the recipients of aid, who are capable of identifying the areas in which investment would produce its best return for the people at which it is aimed. Unless we rely on their judgement and their
